At the same time it is clearly recognized that the present unrest and tendency toward radicalism arise from social and economic conditions that are of greater consequence than the individual agitator. An intelligent investigation of the agitator, of his work, and of the results of his work, therefore, demands an understanding of social and economic conditions as a whole. With no social or eco-

conomic theories to exploit, but with the simple desire to work intelligently and effectively, the division is steadily training a group of its agents to take in account these larger factors at the same time that they are investigating individuals. The results of this policy are already apparent.

In addition to its special agents the bureau has a staff of expert accountants. This staff was organized primarily for the investigation of reports of criminal violations of the banking laws of the United States, but its field of operations has been gradually extended until now it includes practically all matters in which the Government may have an interest and which may require the services of an expert accountant. During the fiscal year ended June 30, 1919, the number of bank cases brought to the attention of the department was 189, involving 214 defendants, as compared to 98 cases reported the previous year. Thirty-nine of these cases have been brought to trial, resulting in 32 convictions and 7 acquittals. Twenty-seven cases remain to be investigated. The average number of accountants employed during the year was 15, a decrease of 4 as compared with the fiscal year 1918. During the year, in addition to their regular work, the accountants have been called upon in connection with many of the investigations which have grown out of the neutrality and war statutes, as well as matters of dispute under contracts entered into with the Government. The accountants have also aided largely in securing evidence which resulted in the conviction of a number of persons charged with violations of the national banking laws and postal laws. Their services are also now being utilized in connection with the high cost of living investigation.

3. REORGANIZATION.

One of the first steps toward reorganization was a survey of the field force of the bureau. Since his appointment the director has spent a considerable part of his time in the field inspecting local offices and instructing personnel. A new spirit on the part of field employees is manifest as a result of the director's personal contact with them.

It is to be recalled that the Department of Justice is the law-enforcing agency of the entire Government. The Bureau of Investigation is the investigative agency of the entire department, and as such has occasion to deal with an almost infinite variety of cases. The work of the bureau is therefore necessarily complex, and must remain so. At the same time it is believed that the methods employed in handling this work can be very considerably simplified.

During the war the work of the bureau increased with abnormal rapidity. The number of cases presented for investigation multiplied many times over any preceding period. The entire bureau worked

under a stress that left small opportunity for doing more than meeting the individual problems as they arose. This was particularly true of the Washington office, which had to serve as a clearing house and directing agency for the entire organization. This unprecedented situation, coupled with the retirement of practically the entire administrative force of the bureau, produced a chaos in the records and organization of the bureau which was one of the most difficult problems that the new officers had to meet.

To deal with this situation the bureau has turned to a thorough study of its organization and methods. It is believed that as a result of this study orderly procedure will speedily be restored. Simpler methods are being installed to handle effectively the increasingly heavy and complex duties of the bureau. Substantial progress has already been made in this regard. An effort is being made by the present administrative heads to evolve a form of organization that will fix responsibility beyond question, that will coordinate activities as it has not been possible to coordinate in the past, and that will develop on the part of individuals in charge of various phases of the work a greater expertness than is at present possible.

HIGH COST OF LIVING.

In anticipation of the enactment of legislation which would enable the Attorney General to deal more effectively with profiteering and other causes responsible for the high cost of living, the department, in August, 1919, commenced to plan an organization so that there might be as little delay as possible in getting the work under way after the necessary amendments to the food-control act were passed. The natural nucleus of this organization were the former Federal food administrators, and, accordingly, they were asked to undertake the direction of the fair-price work in their respective States and to reorganize the former county fair-price committees to work in connection with the Federal agencies in the several States. There was a splendid response to this call to render gratuitous public service, and approximately 70 per cent of the former administrators accepted. The governors of the States were asked to recommend some one to serve as fair-price commissioners in the States where the former administrators declined to serve. There is now a Fair Price Commissioner for every State except six. Approximately 50 per cent of the former county fair-price committees have been reorganized. Through these committees the department is able to keep in close touch with prices throughout the country.

In every campaign of this character time is required to perfect an organization. The work is already beginning to show results, and

once the movement is started it will doubtless gain momentum rapidly.

Although the so-called food-control act remains in full force and effect until the termination of the war between the United States and Germany shall be proclaimed by the President, the United States Food Administration, which was created to control the distribution of food products, was forced to suspend activities on June 30, 1919, for the reason that no appropriation was made for its maintenance.

Immediately upon the removal of the restraining influences of the Food Administration upon dealers in food products the prices of practically everything in that line commenced to advance by leaps and bounds, and it became the duty of this department to undertake to deal with the situation to such extent as might be practicable under existing laws.

Profiteering and hoarding are partly responsible for the prevailing high prices. Section 4 of the act was directed principally against profiteering, and except for the unfortunate circumstance that no penalty was provided for the acts therein declared to be unlawful, the department would have been able to deal effectively with many cases of profiteering which came to its attention.

The President realized the gravity of the situation caused by the rapidly mounting prices of the necessities of life and appeared before you in person August 8, 1919, and urged an immediate amendment of the food-control act to extend its scope to all the necessities of life, to provide a penalty for violations of section 4, and to extend the life of the act into peace times. I also appeared before your committee in charge of the matter and urged that the amendments asked by the President be passed. As you know, the amendments became a law October 22, 1919. It is now possible to deal vigorously with all cases of profiteering.

While awaiting the enactment of additional legislation, the department did not remain inactive. Section 6 of the act provided a penalty for hoarding and section 7 authorized the seizure and sale of hoarded necessities. Up to the end of October, 1919, there had been 92 seizures under section 7, and in many of these cases prosecutions are contemplated under section 6. In addition, 22 instances of alleged hoarding have been called to the attention of United States attorneys for investigation, with instructions to seize the goods and prosecute the offenders if the facts warrant such action.

The seizures referred to were made in 18 different States and included the following commodities: Eggs, butter, cheese, pork, poultry, lard, fish, sugar, potatoes, coffee, flour, and canned goods. Approximately 4,800,000 dozen of eggs, 1,700,000 pounds of butter, 2,500,000 pounds of meat, and 20,000 cases of canned goods were included in these seizures.

It has been the policy of the department, whenever possible, to force hoarded goods into the normal channels of trade. To this end, 49 of the above-mentioned cases have been disposed of by releasing the goods under agreements that they would be sold, under the direction of the United States attorneys, within a specified time and at reasonable prices.

Prosecutions for hoarding have also been instituted under section 6 of the act. In two cases indictments have been obtained and these cases are now awaiting trial. In one case involving the hoarding of flour, the defendant entered a plea of guilty and the court imposed a sentence of five months' imprisonment and a fine of \$5,000. This case is now pending on appeal. The imposition of jail sentences will undoubtedly have a most salutary effect.

ADMIRALTY LITIGATION.

H. LA RUE BROWN, Assistant Attorney General.

An additional class of litigation of which the department has assumed jurisdiction arises from the operation of the considerable fleet of Government-owned merchant vessels acquired since the war. Section 9 of the shipping act of September 7, 1916, creating the Shipping Board, as interpreted and applied by the Supreme Court in the *Lake Monroe* case (reported in 250 U. S., 246), declares these vessels, while employed in commercial service, subject to all the laws, regulations, and liabilities of privately owned merchant vessels. It grants the right to enforce by libel proceedings in rem, on the admiralty side of the district courts, claims against them, which permit the vessels being taken into custody by the court and detained until proper stipulations are furnished for their release. Since the beginning of the calendar year 75 such proceedings in rem to enforce claims aggregating approximately \$3,000,000 have been brought against Government vessels. The losses for the most part relate to collision damages and claims for salvage services, and, in most instances, are substantial in amount, due to the high value and earning powers of merchant ships. The department has presented, and now has pending 36 claims against private vessels and their owners for Government losses, aggregating nearly \$2,000,000. The number of claims referred to this department for attention will constantly increase as new tonnage is completed and placed in service, and as vessels are released from the public service of the Army and Navy in which they have been operated and assigned to commercial trades.

While these claims are being asserted in rem against the vessels, resulting in their attachment or seizure, the department has generally been able to arrange promptly for their release, upon stipulation, without incurring losses through their detention. Through the

cooperation of the Shipping Board and the admiralty bar throughout the country, a form of Government stipulation, instead of a surety bond, has been furnished for their release. This course has resulted in saving substantial sums of money, which otherwise would have been expended upon surety premiums, or lost through detention of the vessels pending their release. The situation is, however, not satisfactory and the passage of a bill now pending defining the liability of the United States and obviating the possibility of detention of its ships will bring relief both to the Government and to those who have claims against it.

This department has had referred to it a number of claims against vessels, arising in foreign waters. In the majority of cases it has arranged with owners and underwriters having such claims to present them in the courts of this country. A number of claims, however, have been presented in foreign countries, where the department, through the cooperation of the State Department and the consular service, has been able to appoint local solicitors to arrange for the release of the vessels upon Government undertakings executed by the consul, and to defend for the Government's interests. The number of these claims will multiply as the vessels are assigned to foreign trades. The expenses incident to the defense of these claims are considerable, and ample appropriations to defray them are essential. Legislation dealing with this subject also is pending and its passage should be expedited.

Another class of cases referred for attention by the Secretary of War relates to claims for damages to vessels in the service of the War Department, sustained in foreign waters, many against privately owned vessels of allied governments and many against vessels owned by our allied governments. The actual presentation of these claims, of necessity, must be delayed until after the adoption, by convention or otherwise, of a proper method for their presentation and liquidation. Action toward securing proper relief in this regard appears proper, as otherwise they may be lost or prejudiced through delay.

OPINIONS.

On May 31, 1918, the President ordered that all law officers of the Government, excepting those in the Philippine Islands, including all law officers attached to any executive bureau, agency, or office specially created for the prosecution of the existing war, should exercise their functions under the supervision and control of the head of the Department of Justice, in like manner as the law had theretofore provided with respect to the solicitors for the principal executive departments and similar officers, and that any opinion or ruling by the Attorney General upon any question of law arising in any department, executive bureau, agency, or office should be treated as binding

upon all departments, bureaus, agencies, or offices therewith concerned. This order gave the Attorney General authority to render opinions upon questions of law not only to the heads of the executive departments, but also to the heads of independent establishments.

During the fiscal year 1918, 54 opinions were rendered upon questions of law, 10 being upon requests of the President, 39 upon requests of heads of executive departments, and 4 to independent establishments. In addition 2 are being held confidential upon the request of the head of the department or establishment to whom rendered.

WAR ACTIVITIES.

During the war there was established in this department a War Emergency Division, which handled cases arising under the war statutes. Since the signing of the treaty of peace, and as the emergency no longer exists, that division has practically been abolished.

The remaining cases and legal matters arising under those statutes have been assigned to the Criminal Division of the department. A great many cases have been handled under these statutes, but with the passing of the emergency this class of cases has, of course, diminished, with the exception of the selective service cases, which are now being pushed with vigor and will involve considerable work.

SELECTIVE SERVICE CASES.

There are pending a large number of draft cases now in the course of elimination and classification. These cases are being investigated for the purpose of segregating the willful delinquents from the non-willful, with a view to proceeding as promptly as possible with the prosecution of all willful cases. The records of the numerous draft boards are now in Washington and are being classified so that the investigating work, for the purpose of securing the necessary evidence with which to prosecute, can be proceeded with. A number of these cases will be moved for trial at the fall terms of court, and the others as speedily as it is possible to properly prepare them.

Violations of the above act involve the failure to register, failure to return questionnaires, making false statements in questionnaires, etc., and in view of the voluminous records of the various draft boards it was impracticable to proceed with the preparation of the cases until the records were all assembled in Washington and classified.

Prosecutions, however, in a great many instances were instituted during the fiscal year. There were pending at the close of the last fiscal year 2,021 cases; there were 15,262 prosecutions commenced during the year, and 7,873 cases terminated during that year.

Amongst the cases prosecuted under this act and passed upon by the circuit court of appeals are the following:

(1) *United States v. Pappens et al.*, northern district of California.—Defendants were convicted of violating section 13 of the selective service act, and judgment of the lower court affirmed by the circuit court of appeals.

(2) *United States v. Sugar*, eastern district of Michigan.—The defendant pleaded guilty and was sentenced to one year for failing to register, in violation of section 5 of the act. A motion was entered by defendant in arrest of judgment, but judgment was affirmed by the circuit court of appeals.

(3) *United States v. Louis C. Fraina et al.*, southern district of New York.—Defendants were convicted of conspiracy to bring about violations of the selective-service act. At the time of the last report this case was pending in the circuit court of appeals. That court has since affirmed the decision of the lower court.

(4) *United States v. Bentall*, district of Minnesota.—Bentall was convicted of aiding, abetting, counseling, commanding, and inducing another to refuse to register in the military service. The judgment of the lower court was affirmed.

(5) *United States v. Gruher*, southern district of New York.—The defendant was convicted of having conspired to violate the provisions of section 6 of the selective service law, the theory of the indictment being that in return for money Louis P. Cherey and Samuel J. R. Bernfeld were to aid the defendant by making certain false and incorrect physical examinations and false statements and certificates as to the fitness and liability of persons examined for service. Gruher was sentenced to two years in the penitentiary. The case was appealed and the judgment affirmed.

(6) *United States v. Goldstein*, northern district of Illinois.—Goldstein was convicted in the above district of unlawfully selling intoxicating liquors to soldiers in uniform, in violation of the selective service act. An appeal was taken to the circuit court of appeals and the judgment affirmed.

(7) *United States v. Pass*, western district of Washington.—Pass was charged with willfully failing and refusing to present himself for registration, in violation of sections 5 and 6 of the above act. He was convicted and the case taken to the circuit court of appeals, which court affirmed the judgment.

(8) *United States v. M. B. Breitmayer*, eastern district of Michigan.—The defendant was tried and convicted of violating section 5 of the selective service act for willful failure and refusal to present himself for, or submit to, registration. The case was taken up on writ of error and the circuit court of appeals found no material error in the proceedings and affirmed the judgment.

ESPIONAGE ACT.

The provisions of the act under which most of the cases arose are contained in section 3, Title I, although the act contains numerous other provisions. The effect of the prosecutions under this act has, no doubt, been beneficial in maintaining law and order.

At the close of the last fiscal year there were 496 cases pending, 968 cases were commenced, and 1,179 terminated.

After the signing of the treaty of peace sporadic instances of apparent violations have come to the attention of the department, but comparatively speaking, the number of actual cases arising since that time has been small.

Amongst the cases during the fiscal year were the following:

(1) *United States v. Doe*, district of Colorado.—Doe was indicted for violating section 3, Title I, and section 3, Title XII, of the espionage act, and found guilty. He

took the case to the circuit court of appeals and the judgment of the lower court was affirmed.

(2) *United States v. Deason*, western district of Texas.—This defendant, having made threats against and in the presence of a member or members of the local examining board because of his not receiving a different classification and for the purpose of bringing about a change in his classification, was indicted and convicted under section 3, Title I, of the espionage act. Upon a review of the case by the circuit court of appeals the judgment was affirmed.

(3) *United States v. Hall*, western district of South Carolina.—The defendant was tried and convicted under the espionage act for making false statements and doing other acts with intent to interfere with the prosecution of the war. Upon a writ of error from the circuit court of appeals it was held by that court that it was prejudicial error to admit evidence of threats made by the defendant against the President not connected with the acts with which he was charged, and the judgment was reversed.

(4) *United States v. Shidler*, district of Nevada.—Shidler was convicted of violating section 3 of the above act, for willfully and unlawfully making certain false statements with intent to promote the success of the Imperial German Government. This judgment was passed upon by the circuit court of appeals and affirmed.

(5) *United States v. Heynacker*, district of South Dakota.—The defendant violated section 3, Title I, of the espionage act by causing or attempting to cause disloyalty, etc., in the military forces of the United States by obstructing the recruiting and enlistment service of the United States when they were at war, and was convicted. Upon review by the circuit court of appeals the judgment of the lower court was affirmed.

(6) *United States v. Reitz*, district of South Dakota.—Reitz violated section 3 of the above act by using language with intent to obstruct the recruiting and enlistment in the service of the United States. The defendant took the case to the circuit court of appeals, which affirmed the lower court's judgment.

(7) *United States v. Shilter*, northern district of California.—Shilter was convicted of attempting to cause insubordination, disloyalty, and refusal of duty in the military and naval forces of the United States, in violation of section 3 of the espionage act. A writ of error was prosecuted in the circuit court of appeals, which court held that the indictment was insufficient to sustain the conviction and ordered the defendant discharged.

(8) *United States v. Sanberg*, district of Arizona.—The defendant was indicted, tried, and convicted for violation of section 3 of the act, by stating that our entry into the war was brought about by Wall Street interests to protect loans to the Allies; that the invasion of Belgium by Germany was justified; that the sinking of the *Lusitania* was justified on account of carrying supplies and ammunition, etc. The judgment of the lower court was reversed by the circuit court of appeals on the ground that the statements were made in a private conversation, and were only regarded as an opinion.

The following will show the further action taken during the last fiscal year in certain cases which were reported in the previous annual report:

United States v. Victor L. Berger, northern district of Illinois.—This case involves a conspiracy to violate section 3, Title I, of the act, by means of speeches, leaflets, pamphlets, and other literature attacking the war and conscription. The case had not been tried when the previous report was made. All the defendants have, however, since been found guilty by the trial court and sentenced to 20 years each. The case is now pending before the circuit court of appeals.

United States v. Balbas, district of Porto Rico.—Balbas was convicted in the district court of causing and attempting to cause insubordination, etc., by unlawfully, will-

fully, knowingly, and feloniously publishing certain false statements in the Spanish language, and was sentenced to two years in the penitentiary and to pay a fine of \$1,000. On writ of error to review the judgment in the circuit court of appeals the judgment was reversed on the ground that there was no evidence to sustain the verdict of the jury that the defendant published either article willfully, with intent to create insubordination, etc. The case was remanded to the district court for further proceedings.

United States v. Mead, western district of Washington.—The defendant was an I. W. W. organizer, who made certain utterances which were not directed against participation in the service of the American Army, but against participation of Canadians in the service of the British Army. The previous report showed that the defendant had been convicted but that the case was pending in the circuit court of appeals. The latter court has since passed upon the case and affirmed the judgment of the lower court.

United States v. Benedict Prieth et al., district of New Jersey.—The defendants were owners, publishers, editors, and leading writers of a prominent German language newspaper of Newark. The case involved a series of articles attacking the motives behind the war and suggesting nonparticipation of the German-Americans. In the last annual report it was stated that the jury disagreed upon the first trial and that the case was still pending in the trial court. After mature consideration of all the facts and the result of the first trial, it was generally conceded that it was extremely improbable that a conviction would result in the event of a second trial of the case, and the same was therefore dismissed.

United States v. Scott Nearing and the American Socialist Society, southern district of New York.—Nearing was engaged in making speeches and writing pamphlets against the war. One of these pamphlets was entitled "The Great Madness," written by Nearing and published by the other defendant, purporting to describe the manner in which big financial interests first conceived the scheme of creating a war which would instill patriotic emotions in the American people and divert attention from the wrongs committed by the capitalists themselves, and then proceed to carry their scheme into effect by bringing on the present war. At the time the last annual report was prepared the case was pending for trial. This case came to trial on February 5, 1919, and resulted in a verdict acquitting the defendant Scott Nearing, and found the defendant the American Socialist Society guilty upon two counts of the indictment. A writ of error has been taken on behalf of the American Socialist Society to the circuit court of appeals to review the judgment of conviction.

United States v. Emil Hernan, western district of Washington.—The defendant publicly exhibited and displayed a circular attacking the vocation of a soldier as the lowest and basest of all occupations. At the time of the last report the defendant was convicted and the case was pending in the circuit court of appeals. The appellate court held that the facts, together with the evidence, were amply sufficient to show the intent of the defendant to violate the espionage act, and affirmed the judgment.

United States v. Joseph F. Rutherford, eastern district of New York.—This was one of the important cases reported in the last report, involving religious antiwar propaganda, and grew out of the publication entitled "The Finished Mystery." The defendants were convicted in the lower court and at the time of that report the case was on appeal in the circuit court of appeals. The circuit court of appeals has now handed down its decision reversing the judgment of conviction and sending the case back for a new trial.

SABOTAGE.

The number of cases arising under this act was small, but the following are mentioned:

United States v. Frank Ernewein et al., western district of New York.—Ernewein was one of the defendants in the case against Eastman et al., previously reported,

which was a case against a group of foremen and workmen in the Curtis plant based upon an attempt to conceal cracks in aeroplane propellers. The jury acquitted the defendant Ernewein.

United States v. Frederick W. Bishoff and William Hinemeyer, district of New Jersey.—These defendants were indicted for a violation of the sabotage act. They agreed to blow up two plants at Irvington, in Essex County, N. J., in one of which war materials were being manufactured and in the other ammunition was being stored and used in the loading of fuses for shells. Bishoff pleaded guilty and Hinemeyer was found guilty by the jury. Bishoff received a sentence of 25 years and Hinemeyer 15 years.

REGULATION OF THE CONDUCT OF ALIEN ENEMIES.

The signing of the armistice November 11, 1918, removed the necessity for the continuance of many regulations as to alien enemies: The President, accordingly, by proclamation of December 23, 1918, rescinded, to take effect December 25, 1918, regulations numbered 1 to 8, inclusive, and regulation 11 of the proclamation of April 6, 1917; regulations numbered 13 to 20, inclusive, of the proclamation of November 16, 1917; and all regulations as extended to women by the proclamation of April 19, 1918. These proclamations did not affect the department's authority over any alien enemy detained, arrested, confined, or interned for the violation of any regulations then in force, nor did it release any alien enemy from the obligations of a parole previously imposed upon him. The department's power to arrest, detain, and parole or intern dangerous alien enemies was not affected by this proclamation. This proclamation, however, abolished prohibited areas and permitted German alien enemies again to reenter the District of Columbia.

The department has, by virtue of authority delegated by the President to the Attorney General under the provisions of section 4067 of the Revised Statutes, caused the arrest under presidential warrant of approximately 6,300 alien enemies. Of this number, in excess of 2,300 have been delivered to the custody of the military authorities for internment. The remaining number, with the exception of a comparatively few who were released without restriction, were placed on parole.

The conclusion of hostilities made it incumbent upon the department to make arrangements for the disposition of alien enemies detained in the internment camps at Fort Oglethorpe, Ga., and at Fort Douglas, Utah. Commissioners representing the United States Government and the German Empire had met in Berne, Switzerland, at a conference beginning September 24, 1918, to discuss plans for the repatriation of civilian internees and of prisoners of war. The department was represented at this conference by Hon. John W. Davis, then Solicitor General, assisted by Mr. Charles Moorfield

Storey. An agreement was adopted and signed by the conference November 11, 1918. The signing of the armistice by the German Government on the same date rendered many provisions of the Berne agreement void, and it was not ratified by the Government of the United States.

The department was, however, willing to carry out many of the provisions of the Berne agreement with reference to the repatriation of civilian internees, and, in the beginning of 1919, began arrangements for the repatriation of interned alien enemies, particularly the former members of the German merchant marine who were detained, though not interned on individual presidential warrants, at Fort Oglethorpe, Ga. As soon as arrangements were made for travelers to reach Germany by way of neutral countries, the department expressed its willingness to consider the application of any interned alien enemy for repatriation at his own expense. As soon as the cooperation of the German Government was assured, the department joined with other branches of this Government and with the Swiss Legation in arranging for the general repatriation of all German internees willing to return to their native country. The first repatriation transports, upon which substantially all of the interned seamen were repatriated, with the exception of the small number of former officers and men of the German merchant marine who were permitted to remain in the United States, sailed from Charleston, S. C., June 28, July 2, and July 10, 1919, respectively. A fourth transport, upon which were repatriated prisoners of war who had been held by the War Department at Fort McPherson, Ga., sailed from Hoboken, N. J., September 26, 1919, and by the courtesy of the War Department a considerable number of civilian internees desiring repatriation were allowed passage on this transport. The inability or unwillingness of the countries comprising the former Empire of Austria-Hungary to cooperate with the United States in arranging for the repatriation of their interned nationals has made it impossible, up to the date of the writing of this report, to repatriate Austrian alien enemies who are not able to pay their own ocean and European transportation expenses.

The relaxation of the regulations as to alien enemies on December 25, 1918, induced the department to make immediate plans for paroling the less dangerous interned alien enemies who did not desire repatriation. The cases of all internees were summarized and classified preparatory to paroling those the occasion for whose detention had ceased. The process of considering applications for parole has gone steadily forward, with the result that parole and repatriation have decreased the population of the internment camps to approximately 300.

The department has not authorized the release of all interned alien enemies because it has believed that many of those arrested and interned have no proper place in the United States. The department has urged the enactment of legislation which will add to the classes of aliens who may be deported, in the discretion of the Secretary of Labor, those interned alien enemies who, after hearing, shall be found by the Secretary of Labor to be undesirable. The department's position in this respect was set forth in a letter dated May 27, 1919, to Hon. Albert Johnson, chairman of the Committee on Immigration and Naturalization, House of Representatives, Washington, D. C.:

I respectfully direct your attention to the necessity for the passage of some legislation which will provide power for the deportation and exclusion from this country of those interned dangerous aliens whose presence here would constitute a menace in times of peace. My predecessor, Attorney General Gregory, and the Secretary of Labor, under date of February 5, addressed to your predecessor as chairman of the Committee on Immigration and Naturalization a joint letter urging action of this character; and in compliance with their request the House Committee on Immigration and Naturalization subsequently reported to the House of Representatives for passage the bill H. R. 15098 framed in accordance with the views of the Attorney General and the Secretary of Labor. The bill, however, was not reached on the calendar and failed of passage. I inclose herewith for your perusal a copy of the joint letter addressed to your predecessor, together with a copy of the bill referred to.

Since February 5 the internment cases have been steadily reviewed and there have been released on parole from the internment camps a considerable number of the least harmful alien enemies. Between 500 and 700 of those now in internment desire repatriation to Germany. Making allowance for this number there will still remain in the internment camps a considerable number, about 500 of whom, in my opinion, would constitute a menace to the safety of this country in times of peace. These are persons whose acts of hostility toward this Government during the war could not be reached by the criminal laws, but they were, nevertheless, genuinely dangerous to our safety. In addition to this group there are approximately 150 aliens who during the war have been convicted for violation of the espionage act, the sabotage act, and various other so-called war statutes. In the two groups of aliens last described there are many who acted as official spies of the Central Powers, bomb plotters, enemy soldiers and sailors, official propagandists, as well as a large number who have criminal records in this country of a serious character. In my judgment these people ought not to be allowed to remain here.

In the present state of the law there is no way in which these dangerous interned alien enemies can be deported. Unless Congress takes some action to provide for their deportation under suitable restrictions as to hearings, procedure, etc., they will be turned loose upon the country as soon as a treaty of peace is ratified.

It is my hope that the inclosed proposed bill or some other measure of a similar character may be introduced and given immediate consideration by your committee. In view of the seriousness of the emergency I desire to fulfil my responsibility toward the people of the country by respectfully asking that suitable action be taken by your committee as quickly as possible to protect the nation in the premises.

Respectfully,

(Signed)

A. MITCHELL PALMER,
Attorney General.

H. R. 6750, providing for the possible deportation, both of interned alien enemies and of aliens convicted of violating certain

named war statutes, has, at the date of the writing of this report, passed the House of Representatives and is under consideration by the Senate.

The department has submitted to the Secretary of Labor the names of interned alien enemies of anarchistic and revolutionary tendencies, and deportation warrants have been issued for such of these individuals as in the opinion of the Secretary of Labor may be deported under the provisions of the act of Congress approved October 16, 1918.

The actual return to the conditions of peace in the United States has seemed to the department to justify the cancellation of the paroles of substantially all alien enemies who have not been interned and of a large number of those early released from the interment camps whose conduct while on parole has been satisfactory. United States attorneys and marshals and special agents of the Bureau of Investigation, in accordance with instructions issued by the department, have participated in the cancellation of paroles. In most cases paroles have been canceled only upon the recommendation of the paroling authority.

The conclusion of hostilities and the consequent decrease in the number of investigations of alien enemy activities in the United States resulted in the disbanding of the American Protective League, which was organized with the approval of the Attorney General and operated under the direct supervision of the Bureau of Investigation of this department. A number of private organizations which had been formed for the purpose of systematically detecting violations of law courteously offered to supply the Department of Justice with information of this character gathered by them. The department, while realizing the patriotic motives with which these organizations were formed, and while welcoming at all times information germane to its work from whatever source it may come, felt obliged to adhere to the traditional policy of the department to have no connection officially or semiofficially with any private organization. The department therefore instructed its officials not to enter into relationship with such extra-governmental associations.

NATURALIZATION OF ALIEN ENEMIES.

The naturalization law, as amended by act of Congress approved May 9, 1918, makes provision for the naturalization of three distinct groups of alien enemies, viz:

(1) Alien enemies whose declaration of intention had been made under the old law but whose first papers had become outlawed. The time within which these old-law declarants could complete their naturalization was extended to December 31, 1918.

(2) Alien enemies who had filed their first papers not more than seven nor less than two years prior to the declaration of war between the United States and the country of which they were nationals.

(3) Alien enemies not falling within the class last above described, but who had been prevented from obtaining second papers by reason of the declaration of war.

The department received approximately 1,200 applications from old-law declarants coming within the first class above mentioned. Although most of these applications were filed after November 1, 1918, in view of the fact that a final hearing was required prior to December 31, 1918, in order to preserve the validity of these declarations of intention, their applications were given immediate attention, with the result that all of them were acted upon prior to December 31, 1918. After thorough investigation, the presidential exception was granted and appropriate certificate made to the Secretary of Labor in 990 cases, leaving approximately 210 cases in which the application for the presidential exception was denied.

Investigation and report on alien enemies who had filed their first papers not more than seven nor less than two years prior to the declaration of a state of war between the United States and Germany or Austria-Hungary, depending upon the nationality of the applicant, was not a statutory duty imposed upon the department, but a task voluntarily assumed in the interest of protecting the country. By an arrangement of courtesy between the officials of the Department of Labor and this department it was agreed that the Department of Labor would refer to the Department of Justice for preliminary investigation the name of every alien enemy applying for citizenship, in order that the Bureau of Naturalization of the Department of Labor might have the benefit of any information contained in the confidential files of this department. This department has in its confidential files individual biographical reports on upward of 50,000 alien enemies. Of this number between 6,000 and 7,000 relate to alien enemies who have either been interned as dangerous alien enemies or at one time were suspected of disloyalty, and later, for one reason or another, released or paroled. The department has in its registration files more or less complete biographical information as to 480,000 male and female German alien enemies. The arrangement between the Department of Labor and this department was carried out until July 1, 1919, when the necessity of greatly diminishing the staff assigned to war work in this department required the department to restrict its reports on alien enemies belonging to the second category to such as were considered of especial significance by the Bureau of Naturalization.

The results of these many investigations of alien enemies applying for naturalization suggest that some arrangement should be made by which the Bureau of Naturalization can utilize material in this department's confidential files concerning these applicants.

Subdivision 11 of the act of Congress approved May 9, 1918, requiring affirmative action by the President excepting certain alien enemies from the alien-enemy classification after investigation and report by the Department of Justice fully establishing their loyalty imposed a heavy burden upon the department. Approximately 5,100 applications for the presidential exception have been received. The amount of intensive investigation on these cases is large and involves in addition much routine clerical work and special correspondence. In view of the amount of effort and expense connected with this work and the fact that it will necessarily cease upon the ratification of the treaty of peace, since July 1, 1919, the staff in the department assigned to this duty has been materially reduced. Final action has been taken in approximately 1,100 cases of applications for presidential exceptions. Nearly 600 of these have been denied, approximately two-thirds of the denials being without prejudice. The department's position has been that a recommendation for presidential exception should be given only upon unmistakable proof of patriotic service during the war. Approximately 2,000 cases are in various stages of investigation. Approximately 600 applications have been returned to the applicants for correction and have not been refiled with the department. Approximately 1,500 applications received for the most part since June 1, 1919, have been acknowledged and sent to the files and have not yet reached the stage of investigation. The department has appropriately acknowledged approximately 1,300 letters requesting forms upon which to make application for the presidential exception.

TRADING-WITH-THE-ENEMY ACT.

There are a number of cases under the trading-with-the-enemy act now pending, and a number of decisions of interest and importance have been rendered. Among them are the following:

1. *Rumely v. McCarthy, United States Marshal et al.*, in the Supreme Court of the United States (250 U. S., 283).—It was held in this case, upon habeas corpus proceedings, that the offense of failing to report the possession of enemy property to the Alien Property Custodian is committed in the District of Columbia, where the Alien Property Custodian has his office and the reports are by law required to be made.

2. *Salamandra Insurance Company v. New York Life Insurance & Trust Company*, in the southern district of New York (254 Fed., 852).—In this case it was held that an injunction would not be issued to restrain enforcement of demand issued by the Alien Property Custodian requiring property to be delivered to him pursuant to determination that the property belonged to or was held for an enemy. In addition, the constitutionality of the trading-with-the-enemy act, which had been attacked, was upheld.

3. *American Exchange Bank v. Palmer and Simon*, southern district of New York (256 Fed., 680).—In this case it was held that where the Alien Property Custodian had issued demand for a bank deposit and an American citizen was asserting that the property belonged to him, interpleader would lie, and the bank could be discharged by payment into court of the amount deposited with it and in dispute.

4. *City National Bank of Selma, Alabama, v. Dresner Bank et al.*, southern district of Alabama (255 Fed., 225).—In these cases a motion to dismiss the bill on the ground that the obligation sued for did not constitute a debt within the meaning of section 9 of the act was overruled; but the cases were continued until the termination of the war, in order that proper service might be perfected upon the enemy defendants.

5. *Francis P. Garvan as Alien Property Custodian v. Securities of the Munich Reinsurance Company and of other enemy insurance companies*, southern district of New York.—In these cases proceedings in the nature of a libel of information were filed under section 17 of the act for the purpose of enforcing compliance with demand issued by the Alien Property Custodian that the securities in question be delivered to him. It was held that the mere fact that prior to the war the securities had been deposited with trustees for American policyholders and creditors did not, under the terms of the deeds of trust, prevent a seizure of same by the Custodian, and that the remedy afforded by section 9 of the act provided adequate relief for the protection of whatever rights the trustees and the American creditors and policyholders might have. Appeals to the Circuit Court of Appeals have been taken.

6. *Hans Hohner v. Francis P. Garvan as Alien Property Custodian*, southern district of New York.—Hans Hohner, a citizen of Germany, who had taken out first papers under the naturalization acts, but had returned to Germany prior to the war without completing naturalization, sued to recover property belonging to him which had been seized by the Alien Property Custodian, upon allegations that he was in fact not an enemy. The bill of complaint was dismissed upon motion, and appeal has been taken to the Supreme Court of the United States. The constitutionality of the act was attacked, and treaties with Germany were relied upon.

7. *Helene K. Fischer vs. A. Mitchell Palmer as Alien Property Custodian et al.*, middle district of Pennsylvania (259 Fed., 355).—Plaintiff, a resident of the eastern district of Pennsylvania, brought suit in the middle district of Pennsylvania against the Alien Property Custodian and others to recover certain property claimed by her, which had been seized by the Custodian as the property of her father, a citizen and subject of Germany. The constitutionality of the act was attacked. The bill was dismissed, the act being held constitutional and the provisions restricting claimants of property held by the Custodian to a bill in equity as provided in section 9 of the act, in the district court of the district in which the plaintiff was an inhabitant, being sustained.

In addition to these cases, there were pending on November 1, 1919, in the various district courts of the United States a total of 127 cases. These include both actions to establish on behalf of some person not an enemy some interest, right, or title in or to money or property which had been seized by the Alien Property Custodian, and which is held by him or by the Treasurer; and also to collect debts owing from enemies whose money or property has been seized by the Custodian or the Treasurer.

In addition to these cases against the Custodian, there had been filed and were pending on November 1, 1919, in the various district courts, a total of 17 actions brought on behalf of the Alien Property Custodian for the purpose of enforcing compliance with demands issued by the Alien Property Custodian, and requiring delivery to him of property pursuant to the provisions of the trading-with-the-enemy act. Both classes of cases are increasing in numbers.

In addition to litigated matters, petitions to the Attorney General for the executive allowance of claims filed with the Custodian, pursuant to the provisions of section 9 of the trading-with-the-enemy act, have been acted upon as follows:

1. Claims for return of specific money or property:	
(a) Claims allowed.....	288
(b) Claims disallowed.....	32
Total.....	320
2. Claims for debt:	
(a) Claims allowed.....	107
(b) Claims disallowed.....	27
Total.....	134
3. Claims by American citizens who have lost enemy status, for return of money or property seized:	
(a) Claims allowed.....	142
(b) Claims disallowed.....	27
Total.....	169
4. Claims on behalf of citizens of allied nations resident in territory at one time under enemy occupation:	
(a) Claims allowed.....	40
(b) Claims disallowed.....	(¹)
Total.....	40
5. Claims of every kind acted upon:	
(a) Claims allowed.....	435
(b) Claims disallowed.....	59
Total.....	494

Dealing with these claims under the delegation by the President of his authority under section 9 of the trading-with-the-enemy act to the Attorney General has been a problem presenting many questions of novelty and difficulty. The Department has sought to be just and to be liberal in its point of view. It was felt, however, that all disputes of fact and most doubtful questions of law should be determined by the courts, as provided by the statute, and not made the subject of the exercise of Executive discretion.

REPORT OF THE SOLICITOR GENERAL.

ALEXANDER C. KING, Solicitor General.

THE SUPREME COURT.

The following table shows the result of last year's work of the Supreme Court of the United States so far as the number of cases present it. The same number of cases (582) was docketed on the appellate docket for the 1918 term as at the 1917 term. There was,

¹None.

however, an increase by 50 of the number of cases disposed of. The number of cases remaining undisposed of decreased from 495 to 408.

	Appellate docket—October term.										
	1908	1909	1910	1911	1912	1913	1914	1915	1916	1917	1918
Cases at close of previous term not disposed of.....	421	478	586	640	671	604	535	524	522	532	495
Cases docketed at the term.....	487	503	509	530	509	524	528	545	647	582	582
Total.....	908	981	1,095	1,170	1,180	1,128	1,063	1,069	1,169	1,114	1,077
Cases disposed of at the term.....	430	395	455	499	576	593	539	547	637	619	669
Cases remaining undisposed of...	478	586	640	671	604	535	524	522	532	495	408

A reference to the foregoing table shows a total of 1,114 cases on the appellate docket during the 1917 term. The number decreased during the 1918 term to 1,077.

At the close of the October term, 1917, there remained undisposed of on the appellate docket 495 cases and on the original docket 24 cases, making a total of 519. The number of cases docketed at the October term, 1918, was 593, of which 582 were placed on the appellate docket and 11 on the original docket. These, with the 519 cases remaining undisposed of, make the total number of cases pending at the last term 1,112, of which 1,077 were on the appellate and 35 on the original docket. Of this number 680 were disposed of during the term, 669 of which were on the appellate docket and 11 on the original docket, leaving undisposed of at the close of the October term, 1918, 432 cases, 408 being on the appellate and 24 on the original docket.

The number of cases actually considered by the court was 606, of which 204 were argued orally and 402 submitted on printed arguments. Of the 669 appellate cases disposed of, 154 were affirmed, 83 reversed, 102 dismissed, 53 were settled by the parties and dismissed; in 8 questions certified were answered, 262 were denials of petitions for writs of certiorari, and 7 were docketed and dismissed.

The total number of cases on the appellate docket in which the United States was a party or had a substantial interest disposed of at the October term, 1918, was 178. The United States was appellant in 36 of the cases, and appellee, etc., in 123; 3 were certifications of questions; 11 were cases of an original nature; and in 5 briefs were filed as *amicus curiae*.

Of the 36 cases brought up by the Government, 21 were decided in its favor and 6 adversely, 1 was affirmed in part, 1 was dismissed by the court, 5 were dismissed by the United States, and 2 petitions for writs of certiorari were denied.

Of the 123 cases in which the Government was appellee, etc., 39 were determined in its favor and 10 adversely; 1 was modified and affirmed; 4 were dismissed by the other side; 2 were dismissed under the rules; 5 were dismissed by the court; in 4 the Government confessed error; 4 were docketed and dismissed; 1 was "settled;" 2 cases were declared "moot;" and 51 were denials of petitions for writs of certiorari.

Of the foregoing 178 cases in which the Government had an interest, 26 were appeals from the Court of Claims; 8 of these were appealed by the Government, of which 3 were decided in its favor and 4 against it, and 1 was dismissed by the United States; 18 were appealed by the other side, 13 of which were decided in favor of the Government and 3 adversely, 1 was docketed and dismissed, and 1 was dismissed by the other side.

Fifty-nine were criminal cases; 8 being appealed by the Government under the criminal appeals act, of which 5 were decided in its favor, 2 against it, and 1 was dismissed by the United States. Fifty of these were appealed, etc., by the defendants, 8 of which were decided in favor of the Government, 3 were dismissed by the court, in 4 the United States confessed error, and 35 petitions for writs of certiorari were denied. In 1 case questions were certified, which were answered in favor of the Government's contention.

Eighty-six were appeals, etc., from the circuit court of appeals, in 13 of which the Government was appellant and in 65 appellee. Of the 13 in which the Government was appellant, 9 were decided in its favor, 1 was affirmed in part, 1 was dismissed by the United States, and in 2 petitions for writs of certiorari were denied. Of the 65 in which the Government was appellee, etc., 6 were decided in its favor and 4 adversely, 1 was modified and affirmed, 1 was dismissed under the rules, 1 was dismissed by the court, 1 was dismissed by the other side, and in 51 petitions for writs of certiorari were denied. There were three certifications of questions, all of which were decided in favor of the Government. Two of the above cases were from the Court of Appeals of the District of Columbia.

Five writs of certiorari were awarded in Government cases, in 1 of which the United States was petitioner.

Fifty-three petitions for writs of certiorari were denied. Of these cases the United States was petitioner in 2 and respondent in 51.

There were 2 cases from the Philippine Islands.

The Government was interested in 11 cases of an original nature, of which it was petitioner in 3. Eight of said cases were decided in its favor and 3 adversely.

In 5 cases the Government filed briefs as *amicus curiae*; 1 case was decided in its favor, 2 against its contentions, and in 1 case the court did not pass on the question presented, holding that the certificate of the Circuit Court of Appeals was not in proper form.

ABSTRACTS OF DECISIONS AT OCTOBER TERM, 1918.

The following are abstracts of the more important cases not hereinbefore particularly referred to, decided at the October term, 1918, in which the United States was a party or had an interest.

Ex Parte Hudgings, Petitioner (249 U. S. 378).

This was an original petition filed in the Supreme Court seeking petitioner's discharge from custody under an order of commitment by the district judge for contempt in wilfully refusing while on the witness stand to "answer certain questions truthfully." The Supreme Court held, in ordering petitioner's discharge, that in order to punish perjury committed in the presence of a court as a contempt there must be added the element of obstruction to the court in the performance of its duty.

The Lake Monroe (250 U. S. 246).

This was a petition by the United States for a writ of mandamus or prohibition to prevent the United States district court for Massachusetts from directing the seizure of the *Lake Monroe* to satisfy a claim for damages arising out of a collision. The main question was whether the *Lake Monroe*, a vessel requisitioned by the Emergency Fleet Corporation under the provisions of the emergency act of June 15, 1917 (40 Stat. 182), but chartered to a private concern for use as a merchant vessel, was subject to the provisions of the Shipping Board act of September 7, 1916 (39 Stat. 728), directing that every vessel purchased, chartered, or leased from the Shipping Board "while employed solely as merchant vessels shall be subject to all laws, regulations, and liabilities governing merchant vessels." The Supreme Court held that vessels taken over by the Emergency Fleet Corporation and chartered to operating agents under the act of 1917 were subject to the provisions of the original Shipping Board act, and thereupon dismissed the Government's petition.

Tempel v. United States (248 U. S. 121).

Acting in the interest of navigation, believing it to be public land within the *de jure* stream and not private property, the Government, not intending to exercise the power of eminent domain, dredged submerged lands of plaintiff in error in the Chicago River. Thereupon the owner brought suit under the Tucker Act to recover \$10,000--the reasonable value of the property. The district court rendered judgment for the United States on the merits. The Supreme Court held that the owner's cause of action, if any, was in tort, that there was no jurisdiction under the Tucker Act, and the suit should have been dismissed for want of jurisdiction.

United States v. Spearin; Spearin v. United States (248 U. S. 132).

Spearin contracted to build a dry dock at the Brooklyn Navy Yard. According to the terms of the contract a section of a sewer was to be relocated before work on the dry dock could be started. This was done in accordance with specifications furnished by the Government and accepted as satisfactory. Thereafter by reason of excessive rainfall and high tide, water was forced up the sewer to a depth of several feet. Because of the existence of a dam in a connecting sewer, unknown to both parties, and bad drainage conditions, known only to the Government, causing undue pressure, the sewer burst, overflowing the excavation for the dry dock. The contractor notified the Government that he would not proceed with work unless the United States made good, or assumed responsibility for, the damage caused and made such changes as would remove the menace to future operations. This the Government refused to do and annulled the contract. The Supreme Court, affirming the judgment of the Court of Claims, held that the Government impliedly warranted that the sewer constructed was sufficient to accomplish its object and that its refusal to accept responsibility to make working conditions safe for the future justified Spearin in refusing to continue work. The court further held that Spearin was rightfully awarded damages by the Court of Claims for all loss growing out of the breach of contract, including his expenditures [less receipts from the Government], and profits he would have made if the work had been completed.

G. S. Nicholas & Company et al. v. United States; Alex. D. Shaw & Company et al. v. United States (249 U. S. 34).

The tariff act of 1913 provided that whenever any foreign Government should bestow directly or indirectly any bounty or grant upon exportation of any article or merchandise therefrom, there should be levied in addition to the duties otherwise imposed an additional duty equal to the net amount of such bounty or grant. Under the laws of Great Britain certain allowances were directed to be paid in the event of exportation of wine and other spirits removed from duty-free warehouses for exportation. Whisky and gin so removed were imported into this country from Great Britain, upon which the customs collectors assessed additional countervailing duties. The Supreme Court held, affirming judgment of the Court of Customs Appeals, that the allowance provided for amounted to the bestowal of a bounty or grant under the provisions of the act and that such countervailing duties were rightfully assessed.

J. Homer Fritch, Incorporated, et al. v. United States (248 U. S. 458).

It was here decided that judgments of the district courts in suits against the United States under the Tucker Act of 1887 are reviewable directly and exclusively by the Supreme Court, and that such ex-

clusive jurisdiction was not disturbed by the judiciary act of 1891 or the Judicial Code, despite a contrary decision in *Ogden v. United States*, 148 U. S. 390. Accordingly a judgment of the circuit court of appeals affirming a judgment of the district court, in a suit brought under the Tucker Act, was reversed and remanded, with directions to dismiss for want of jurisdiction of said circuit court of appeals.

Cochnower v. United States (248 U. S. 405).

The construction of section 2 of the act of March 4, 1909, concerning compensation of certain officials in the customs service was involved. Said section authorized the Secretary of the Treasury "to increase and fix the compensation of inspectors of customs," etc. The question for decision was whether under the statute the Secretary had authority to decrease salaries. The Supreme Court, reversing the judgment of the Court of Claims, decided that he had not such power; that if Congress had intended to give the Secretary authority to "decrease" salaries it would have explicitly declared it; and that the effect of the words used was to give the Secretary power to increase salaries and thereafter establish (fix) the increased compensation as the legal compensation.

United States v. Brooklyn Eastern District Terminal (249 U. S. 296).

The question involved was whether the Terminal Company, which operates a union freight station under contracts with various interstate railroad and steamship companies to receive freight, unload it, transfer it to other lines, etc., for which it employs switching crews, handling at times from one car to eight, is a common carrier within the meaning of the hours of service act and therefore subject to the provision prohibiting, under penalty, service by employees engaged in the movement of trains for a longer period than 16 consecutive hours. The Supreme Court held that under the circumstances the company was a "common carrier" within the meaning of the act.

Kenny v. Miles et al. (250 U. S. 58).

Question arose in the County Court of Osage County, Okla., in the settlement of the estate of one Lah-tah-sah as to who were her heirs. There were two claimants—John Kenny, admitted to be her son and claiming to be the sole heir, and Laban Miles, claiming to be her surviving husband and an equal heir with Kenny. To prove the relationship Miles introduced a judgment of the district court of the same county in a partition suit wherein it was found that he and deceased had been married a year before her death. This judgment was admitted over objection as conclusive evidence of the relationship of the parties. It was accordingly adjudged that Kenny and Miles were equal heirs. The judgment of the county court was affirmed by

the Supreme Court of Oklahoma on the ground that the lands were unrestricted. The estate in question consisted of homestead and surplus lands patented to Lah-tah-sah under an act of Congress (1906) which contained provision tending to restrict alienation unless upon a certificate of competency from the Secretary of the Interior. A later act (1912) provided that no partition or sale of restricted lands of a deceased Osage allottee shall be valid until approved by the Secretary of the Interior. The judgment in the partition suit was never approved by the Secretary. The question therefore arose, first, whether the lands in question were "restricted lands." The Supreme Court, reviewing the pertinent legislation, arrived at the conclusion that the lands were "restricted lands." In view of this ruling and the fact that the Secretary had not given his approval of the judgment in the partition suit, the court further held that same was inoperative and that Kenny's objection was therefore well grounded. The judgment below was accordingly reversed.

Delaware, Lackawanna & Western Railroad Company v. United States
(249 U. S. 385).

The railroad company sought to recover additional pay from the United States for carrying the mails. It undertook the transportation at a fixed maximum price per mile, depending upon the average weight carried, "subject to future orders," however, and "unless otherwise ordered." Acting under subsequent legislation the Postmaster General readjusted the compensation for the carriage of mail matter and reduced the rates. Held, that there could be no recovery. That in view of the qualifying words quoted, the compensation was subject to change by the Postmaster General.

Seufert Brothers v. United States, as Trustee and Guardian of the Confederated Tribes and Bands of the Yakima Indians and Nations et al.; United States, as Trustee and Guardian of the Confederated Tribes and Bands of the Yakima Indians and Nations et al. v. Seufert Brothers Company (249 U. S. 194).

The question presented was whether a treaty between the United States and the Yakima Indians of Washington, which contained a provision permitting the tribe to fish at all accustomed places in common with citizens of the then territory, gave it the right to fish on the south or Oregon side of said river, in view of the fact that lands ceded by them under the treaty were on the north bank only. The Supreme Court held they were so entitled, as the evidence showed that the south bank had been habitually resorted to by these Indians and others for fishing purposes for a long period of time.

Chesapeake & Delaware Canal Company v. United States (250 U. S. 123).

The principal question involved was the applicability of a State statute of limitations and the doctrine of laches in a suit in 1912 to recover dividends declared in 1873, 1875, and 1876 on stock of the canal company owned by the United States. Held, that the Government was in the position of a creditor, was asserting sovereign and governmental rights in attempting to collect "public money," and, therefore, was not subject to either State statutes of limitations or laches.

Lane, Secretary of the Interior, et al. v. Pueblo of Santa Rosa (249 U. S. 110).

Suit was brought by the Pueblo to restrain the Secretary of the Interior and the Commissioner of the General Land Office from listing and disposing of as public lands certain lands claimed by the Indians to have been acquired by them under the laws of Spain and New Mexico. A motion to dismiss the bill was sustained in the Supreme Court of the District of Columbia. On appeal to the court of appeals the decree of dismissal was reversed, with directions that a permanent injunction be awarded. Two questions were raised on the appeal to the Supreme Court of the United States,—(1) whether the Pueblo was a legal entity and capable of maintaining a suit as such; and (2) whether the defendants should be subjected to a permanent injunction without opportunity to answer the bill. The court held, in respect to the first contention, that the Pueblo was capable of suing as a legal entity, by virtue of legislation incorporating the region into the (then) Territory of New Mexico and subjecting it to "all the laws" of New Mexico, among which was one providing that the inhabitants of any Indian pueblo having a grant or cession of lands from Spain or Mexico should be a body corporate and as such capable of suing and defending in respect to such lands. With respect to the second contention, the court held that the permanent injunction should not have been awarded without affording defendants opportunity to answer the bill, and remanded the cause to the court of first instance with appropriate instructions.

United States v. Union Pacific Railroad Company (249 U. S. 354).

The question at issue was whether the following were "troops" within the meaning of the various land grant acts and were entitled to transportation at the reduced rates provided therein over the Union Pacific road, a land grant line: Discharged soldiers, discharged military prisoners, rejected applicants for enlistment, applicants for enlistment provisionally accepted but subject to final examination and not sworn in, retired enlisted men, and furloughed soldiers en route back to their stations. Held, that they were not "troops" within the meaning of the acts.

United States v. Atchison, Topeka & Santa Fe Railway Company (249 U. S. 451).

The railway company undertook to carry the mails for certain quadrennial periods at a compensation based upon ascertained weights. Subsequently the parcels post act was passed, adding greatly to the weight of mail matter to be carried. To provide for the increased weight, legislation was enacted authorizing the Postmaster General to add to the compensation paid "not exceeding 5 per cent thereof per annum." Under the authority conferred, the Postmaster General apportioned increases among the various roads — never awarding in excess of 5 per cent. The railway company sued to recover the difference between the amount received by it and the amount it would have received if 5 per cent had been added. The Supreme Court held that the language of the statute was clear, and that the amount of increase was in the discretion of the Postmaster General, which had not been abused.

Alaska Pacific Fisheries v. United States (248 U. S. 78).

This was a suit by the United States to enjoin appellant from maintaining an extensive fish trap in the navigable waters adjacent to the Annette Islands in Alaska, on the ground, principally, that the trap was erected in a reservation set apart for the use of the Metlakahtla and other Indians. The act of March 3, 1891, defined such reservation as "the body of land known as Annette Islands," etc. The principal question involved was whether the reservation embraced only the uplands of the islands or included also adjacent waters and submerged land. The Supreme Court decided that in view of the location and character of the land, the vocations of the Indians as fishermen and hunters and their purpose in migrating to the islands to carry on such occupations, etc., it was plain that Congress intended to set apart the waters surrounding the islands as a part of the reservation, and affirmed the decree of the court below.

Rand et al., Executors, v. United States (249 U. S. 503).

This was a suit to recover a legacy tax alleged to have been erroneously assessed and collected under the inheritance tax provisions of the war revenue act of 1898. Revised Statutes, section 3226, provide that no suit shall be maintained for the recovery of a tax illegally or erroneously assessed or collected until appeal shall have been duly made to the Commissioner of Internal Revenue and the decision of the commissioner had therein. In this case money was given in trust to pay to Mrs. Rand (deceased) the annual income thereof in semiannual payments during her life. Two claims for repayment of the alleged illegally assessed taxes were filed with the Commissioner

of Internal Revenue, one on behalf of the trustee under the will and one on behalf of the administrator *de bonis non*, both of which claims were rejected. It was not shown, however, that Mrs. Rand or any person in her behalf had filed a claim with the commissioner. Held, that the requirements of the statute had not been complied with.

Lane, Secretary of the Interior, v. Darlington et al., Trustees, etc. (249 U. S. 331).

The right of the Secretary of the Interior to make an official resurvey of the boundary of a patented Mexican grant, in order to locate the original survey, was sustained in this case. The power of survey by the Secretary is not exhausted by a single exercise of it; and the resurvey, it was held, did not affect the rights of owners on the other side of the line already existing in theory of law. Dismissal of a bill praying an injunction to restrain such resurvey was therefore ordered.

Parker, as Superintendent for the Five Civilized Tribes, et al., v. Riley, a Minor, by Stockton, her Guardian, et al. (250 U. S. 66).

This case presented the question whether in an oil and gas lease of lands in which certain Indians had an estate for years entitling them to the rents, issues, and profits for such period, royalties derived therefrom would go to the tenant for years or to the remainder man. The court held that the royalties formed a part of the remainder estate and should be collected and invested by the Interior Department, and the corpus thereof go at the end of the estate for years to the remainder man. The interest on such investment should be paid to the tenant for years.

Brougham et al. v. Blanton Manufacturing Company (249 U. S. 495).

Appellee company was a manufacturer of oleomargarine under the trade name "Creamo," registered under the trade-mark law. Upon the enactment of the meat inspection act of 1906 the company's plant was subjected to inspection as a manufacturer of a meat food product by the Department of Agriculture. The trade name, approved by the Secretary of Agriculture, was subsequently by him denied to the company's use upon the ground that it was false and deceptive, inspection having developed the fact that the company in its manufacture of its product had replaced cream with skimmed milk. Held, that the company's product was a meat food product; that as such it was subject to the meat inspection act, which provided that no meat food product should be offered for sale under a false or deceptive name and that the trade-mark or name covering said article was subject to the approval of the Secretary of Agriculture; that in view of the fact that cream was no longer used in the manu-

facture of the product, the name "Creamo" was false and deceptive, and that the Secretary of Agriculture was therefore justified in refusing to approve the use of said name.

Houston et al. v. St. Louis Independent Packing Company (249 U. S. 479).

This case involved the power of the Secretary of Agriculture to prohibit the use of the word "sausage" as false and deceptive, within the meaning of the meat-inspection act of 1906, when applied to the product of appellee, a sausage manufacturer. The Secretary of Agriculture promulgated regulations providing that "sausage" should not contain cereal in excess of 2 per cent or water or ice in excess of 3 per cent. Appellee manufactured "sausage" containing cereal and water in excess of the requirements of the Secretary's regulation. The Secretary therefore refused to mark the product as "inspected and passed." Injunction was sought to enjoin the Secretary from refusing so to mark said product. The district court refused to grant the injunction. The circuit court of appeals reversed the judgment of the lower court. On appeal the Supreme Court decided that the question whether the term "sausage" when applied to product of appellee is false or deceptive within the meaning of the act is a conclusion of fact, the determination of which is committed to the decision of the Secretary by the authority given him to make rules, etc., for giving effect to the act, and that the conclusion of the head of an executive department on such a question will not be reviewed by the courts where it is fairly arrived at with substantial evidence to support it. The decree of the circuit court of appeals was reversed.

Moore v. United States (249 U. S. 487).

Moore brought suit against the Government to recover compensation for the use of a tool, covered by letters patent, of which he was the owner. The act of 1910 allows compensation from the United States for the use of patented inventions, but declares that the benefits of the act shall not inure to any patentee whose device was "discovered or invented during the time of his employment or service in the Government." The invention in question was completed during the time Moore was in the Government service, but in hours when he was not actually on duty. Held, that under the language of the statute the fact that the inventor worked on said device during the hours he was off duty was immaterial, and that the device was actually discovered during the time he was in the Government's employ.

Gulf Oil Corporation v. Lewellyn, Collector of Internal Revenue for the Twenty-third District of Pennsylvania (248 U. S. 71).

The question was whether dividends received by the Gulf Oil Corporation, a holding company, in 1913 out of surplus earnings accruing to its subsidiary corporations prior thereto, such earnings having been used in the enlargement of the plants and properties of the subsidiaries in the conduct of their business (the companies having no other money available to pay their debts), constituted taxable income to the petitioner corporation within the meaning of the income-tax act of October 3, 1913. The Supreme Court held that they were not taxable; that the holding company was no richer than before; that all these companies constituted a single enterprise; and that the transaction should be regarded as bookkeeping rather than as "dividends declared and paid in the ordinary course by a corporation."

Skinner & Eddy Corporation v. United States et al. (249 U. S. 557).

This case involved the construction of section 4 of the act to regulate commerce, as amended, which forbids the charging of a greater compensation for the transportation of passengers and property for a shorter than for a longer distance over the same line in the same direction. The Interstate Commerce Commission, upon application thereto and after a full hearing, had authority to grant relief to the carriers from the operation of the provisions of the section. Section 4 also provided that whenever a carrier by railroad in competition with a water route shall reduce the rates to or from competitive points it shall not be permitted to increase such rates unless after hearing by the commission it shall be found that such proposed increase rests upon changed conditions other than the elimination of water competition. Orders of the commission granting the transcontinental carriers relief from the operation of the provisions of section 4 because of competitive traffic through the Panama Canal were temporarily rescinded, and the carriers were permitted further to increase rates on numerous articles because of the disappearance in large part of such water competitive traffic by reason of the slides in the canal and the increased demand for shipping due to the World War. Skinner & Eddy, shipbuilders, Seattle, sought to enjoin the order allowing the increased rates on iron and steel articles upon the ground that the full hearing required by the statute had not been held by the commission; they also sought to enjoin the carriers from collecting the increased rates. The district court sustained the action of the commission and dismissed the petition of Skinner & Eddy. On their appeal the Supreme Court affirmed the judgment, holding that the prohibition against an increase of rates has no

application when the previous reduction was ordered by the commission after hearing upon application by the carriers, the commission having found that changed conditions "other than the elimination of water competition" existed.

Louisville & Jeffersonville Bridge Company v. United States (249 U. S. 534).

Appellant, a common carrier engaged in interstate commerce, operates a large terminal yard at Louisville. It is separated from the yard of the Illinois Railroad by a street, but the tracks do not run directly from one yard to the other. The question certified by the circuit court of appeals was whether a transfer of 26 cars as a unit from the yard of the terminal company to that of the Illinois Central Railroad Co., involving crossing and recrossing of several city streets and a main track movement of 2,600 feet at a speed reaching at times 15 miles per hour, constituted a "train movement" within the meaning of the safety appliance act, which would make it imperative under regulation of the Interstate Commerce Commission that 85 per cent of the cars so moved should have train brakes upon them used and operated by the engineer of the locomotive. The Supreme Court held that the movement described was a "train movement," to which the 85 per cent requirement concerning brakes applied.

United States v. Hill (248 U. S. 420).

A demurrer was sustained to an indictment charging Hill with carrying on his person intoxicating liquors for beverage purposes from Kentucky into West Virginia in violation of the Reed amendment of 1917. This act provides that whoever shall cause intoxicating liquors to be transported in interstate commerce with certain exceptions into any State or Territory the laws of which prohibit manufacture and sale therein of intoxicating liquors for beverage purposes shall be punished, etc. The laws of West Virginia forbade the manufacture and sale of intoxicating liquors for beverage purposes, although they permitted the bringing into the State of not more than 1 quart of liquor in any 30-day period for personal use. The court below sustained the demurrer on the ground that the words of the act "transported in interstate commerce" were intended to apply only to liquor transported for commercial purposes. The Supreme Court decided that this was too narrow a construction of the act; and, further, that the fact that the State saw fit to permit the introduction of liquor for personal use in limited quantity could in no wise interfere with the authority of Congress under its plenary power over interstate commerce to make the prohibition against interstate shipment of liquor contained in the act. The judgment of the district court was accordingly reversed.

United States v. Doremus (249 U. S. 86).

This case involved the constitutionality of section 2 of the Harrison Narcotic Act of 1914. The act purported to be passed under the authority of the Constitution, Article I, section 8, giving Congress power "to lay and collect taxes, duties, imposts, and excises to pay the debts and provide for the common welfare; but all duties, imposts, and excises shall be uniform throughout the United States." The Supreme Court held that the only limitation upon the power of Congress to levy excise taxes of the character under consideration was geographical uniformity throughout the United States; that the motives actuating the legislation could not be inquired into; and that as section 2 of the act aimed to confine the dispensing and sale to registered dealers and physicians, the court felt that the provisions thereof tended to diminish the opportunity of unauthorized persons to obtain drugs and sell them clandestinely without paying the tax imposed by the Federal law, and that said section therefore aided in the collection of the tax imposed.

Webb et al. v. United States (249 U. S. 96).

The main question in this case was whether the provisions of section 2 of the Harrison Narcotic Drug Act prohibited sales by druggists, registered under the act, to persons who have no physician's prescription, who are without the order blank, and who can not obtain such blank because not of the class to which such blanks are allowed to be issued; and if they did, whether they were constitutional. The court held that they did prohibit such sales, and were constitutional. It was further held that an order for a drug issued to an habitual user by a practicing and registered physician outside the course of professional treatment is not a physician's prescription.

Dillon v. Strathearn Steamship Co., Claimant of Steamship "Strathearn" (248 U. S. 182); Sandberg et al. v. McDonald, Claimant of the British Ship "Talus" (Id. 185); Neilson et al. v. Rhine Shipping Co., Claimant of the Sailing Ship "Rhine"; Hardy et al. v. Shepard & Morse Lumber Co., Claimant of the Barkentine "Windrush" (Id. 205).

These are known as the "Seamen's Act Cases." They involved the construction of certain provisions of the so-called seamen's act of March 4, 1915, which was passed in the interest of the American merchant marine and in order to curb the crimping evil. The Government filed a brief as *amicus curiae*. The questions varied somewhat in the different cases. In the *Strathearn* case a certificate by the circuit court of appeals was dismissed because of failure to state the facts, as required by rule 37 of the Supreme Court. In the *Talus* case the main question presented was that of the applicability of the act to advances to alien seamen shipping abroad on foreign vessels,

pursuant to contracts void under the foreign law. The court grounded its decision on the language of the act itself, which provided in section 10 that the section applied to foreign vessels only "while in the waters of the United States," and that as Congress had also made it an offense under said section to obtain from seamen seeking employment remuneration for so employing them, it could not be supposed that Congress intended to punish criminal acts done within a foreign jurisdiction. In the *Rhine* and *Windrush* cases the court stated that, although the advances were made by masters of American vessels in foreign ports, the interpretation of the statute which controlled in the *Talus* case was equally applicable, and that the act applied only to advances made in domestic ports.

United States v. Gudger (249 U. S. 373).

The sole question for decision was whether the provision of the Post Office appropriation act of 1917 known as the Reed amendment, which prohibits the transporting of liquor in interstate commerce "into" any State or Territory the laws of which prohibit its manufacture, etc., precludes its transportation "through" such a State to another. It was held that it does not, the word "into" having reference to the State of destination.

McKinley et al. v. United States (249 U. S. 397).

Plaintiffs in error were indicted for setting up a house of ill fame within the 5-mile zone prescribed by the Secretary of War in accordance with the provisions of the act of Congress of May 18, 1917, enacted to suppress houses of ill fame maintained near military stations. Plaintiffs in error contended that Congress had no constitutional authority to enact the provisions in question. The Supreme Court decided that, as Congress had the power to raise and support armies, it could make rules and regulations for the protection of their health and welfare; and further that it having adopted restrictions designed to guard the health of the men composing such armies, it could leave the details of the regulations to the head of an executive department and punish those who violate said restrictions.

United States v. Suda Reynolds (250 U. S. 104).

This was a suit brought by the United States in behalf of 11 heirs at law of Stella Washington, deceased, an absentee Shawnee, of Oklahoma, to cancel a deed made by Claudius Tyner, one of said heirs, to Suda Reynolds, conveying an undivided eleventh interest in a tract of land inherited from Stella Washington, the allottee thereof. The legal title to the tract was held by the United States under a certificate of allotment or "trust patent," dated February 6, 1892, declaring that pursuant to the act of Congress of February 8, 1887,

providing for such allotments, the United States should hold the land allotted in trust for the said Stella, and in case of her death for her heirs, the same not being subject to alienation by the beneficiaries, for a period of 25 years, at the expiration of which time the United States would convey the same to said Indian or her heirs in fee, discharged of the trust, unless the trust period had been extended by the President of the United States. Said trust period was extended by presidential proclamation made more than 25 years after the making of said allotments and their approval by the Secretary of the Interior, but less than 25 years from the date of the trust patent executed to the United States which declared said trust. The question was whether the 25-year period ran from approval of the allotment or the date of the trust patent. The Supreme Court decided that under said act the 25-year trust period, with the attendant restriction upon alienation, runs from the date of the trust patent, and not from the approval of the allotment, and an attempt to convey made by an heir of the allottee within the period so extended before its expiration is void, reversing the judgment of the United States circuit court of appeals holding otherwise. The case is the first express decision on this point and governs not only the construction of this act but also of other like acts.

Crocker et al., Trustees, v. Malley, Collector of Internal Revenue (249 U. S. 223).

This was an action to recover taxes paid under protest by Crocker et al. Petitioners were taxed as a joint-stock association within the meaning of the income-tax act of 1913, chapter 16, Section II-G. They insisted they were unincorporated trustees merely and subject only to the duties imposed upon fiduciaries by Section II-D. Certain mill property, preliminary to dissolution of a corporation, was conveyed to them in trust to convert same into money and distribute the net proceeds to persons holding certain trustees' receipt certificates, the time of distribution being left to their discretion, under certain limitations. They were to distribute the net income to the *cestui que trusts*, but were authorized to apply any funds in their hands for the repair or development of the property held by them or the acquisition of other property, pending conversion and distribution. Provision was made for compensation of the trustees which could not be changed without the consent of the beneficiaries, whose consent was necessary also to the filling of vacancies among the trustees and for modification of the terms of the trust. The real estate in question was under a long lease to a corporation in Massachusetts. The Supreme Court held that in no sense could the arrangement effected be determined a joint-stock association; that there was no provision for meeting among the various persons concerned; that the beneficiaries had no

joint action or interest or no control over the fund; that the trustees by themselves plainly could not constitute a joint-stock association, nor would the grouping of the two so result, and that the relation between the parties was that of trustee and *cestui que trust*, and the trustees were taxable only as fiduciaries.

Schenck v. United States; Baer v. United States (249 U. S. 47).

Schenck and Baer were indicted for (1) conspiracy to have printed and circulated to men called and accepted for military service under the selective-service act a document calculated to cause insubordination in the military and naval forces of the United States and to obstruct the recruiting and enlistment service when the country was at war, in violation of the espionage act of 1917; (2) conspiracy to use the mails for the transmission of matter declared to be nonmailable under Title XII of the espionage act; and (3) the unlawful use of the mails for the transmission of the matter above mentioned. The overt act alleged in pursuance of the conspiracies charged was the circulation of the document in question. Plaintiffs in error were found guilty on all counts of the indictment. The inadmissibility of certain evidence was alleged, which question was determined by the Supreme Court against the plaintiffs in error. The principal ground of alleged error was that the first amendment to the Constitution forbidding Congress to make any law abridging the freedom of speech or of the press had been violated. The Supreme Court decided that the document circulated was of an "obstructive nature"; that in time of war many things which might be said in time of peace are prohibited because of their hindrance to the Nation's effort; that in case of conspiracy it is not necessary that the act sought to be accomplished be actually successful if its tendency be to obstruct the activities of the United States during time of war; and, further, that the words in the act "obstruct the recruiting or enlistment service" embraced obstruction to the draft system as well as the volunteer system.

Frohwerk v. United States (250 U. S. 204).

Frohwerk was indicted for (1) conspiracy to violate the espionage act of 1917, section 3, the overt acts alleged being the preparation and circulation of certain articles in the Missouri Staats Zeitung; and (2) attempts to cause disloyalty, mutiny, and refusal of duty in the military and naval forces of the United States by the publications mentioned. Frohwerk was found guilty on all counts of the indictment except one. The contention was urged that the articles in question were protected by the first amendment to the Constitution guaranteeing freedom of speech and of the press. The Supreme Court, contrary to the contention urged, adopted its views in this respect an-

nounced in *Schenck and Baer v. United States* (249 U. S. 47), previously mentioned. It further held that the language of the pamphlet was of a nature calculated to obstruct the military operations of the Government. Plaintiffs in error also contended that the count alleging conspiracy was bad because it did not state the means by which the conspiracy was to be carried out. Held, that a conspiracy to obstruct recruiting would be criminal even if no means were agreed upon specifically by which to accomplish the intent.

Debs v. United States (249 U. S. 211).

Debs was convicted under counts of an indictment charging violation of the espionage act of 1917, as amended by the act of 1918, in that (1) he caused and attempted to cause insubordination, disloyalty, and mutiny in the military and naval forces of the United States, and with intent so to do delivered a public speech, etc., and (2) he obstructed and attempted to obstruct the recruiting and enlistment service of the United States, and to that end and with that intent delivered the speech above mentioned. Plaintiff in error contended in the Supreme Court that the speech was protected by the first constitutional amendment guaranteeing freedom of speech. The court declared this contention controlled by *Schenck and Baer v. United States* (249 U. S. 47). Also that the indictment was sufficient in form (*Frohwerk v. United States*, 249 U. S. 204). The remaining questions involved admission in evidence of the record of conviction of Ruthenberg et al. and of the antiwar proclamation and program of the Socialist Party adopted at St. Louis in April, 1917. Admission of the former evidence was upheld on the ground that, as the defendant in his speech purported to understand the grounds on which these persons were imprisoned, and condemned them, it was proper to show what these grounds were in order to explain the true import of his expression of sympathy and to throw light on the intent of his address. The admission of the latter evidence was upheld in view of the fact that Debs had expressed approval of the platform adopted (which counseled opposition to the war by any and all means); that it was relevant as to his meaning in using the words claimed to be used to obstruct recruiting.

United States v. Ferger et al. (259 U. S. 199); United States v. Ferger et al. (250 U. S. 207).

A demurrer was sustained to an indictment charging (1) forgery and the counterfeiting of bills of lading purporting to represent shipments of goods from Indiana to Ohio and the uttering of such bills of lading knowing them to be falsely made, etc., and (2) uttering of such bills of lading, and, with criminal intent, obtaining money thereon

from the Second National Bank of Chicago by using them as collateral. The question presented for decision was whether the court below erred in holding that the authority of Congress to regulate commerce did not embrace the power to forbid and punish fraudulent fabrication and use of fictitious interstate bills of lading. *United States v. Ferger* (250 U. S. 207) involved conspiracy to do the acts set forth above and the same question was presented for decision. The Supreme Court held that interstate bills of lading are instrumentalities of commerce, which Congress under its power to regulate commerce had authority to deal with; and that as Congress had the power to regulate and deal with such instrumentalities of commerce it had the right to enact legislation to guard them against the injury which would result from the making of spurious imitations thereof. The judgment of the court below was therefore reversed.

Rumely v. McCarthy, United States Marshal (250 U. S. 283).

This was an appeal from a final order of the District Court for the Southern District of New York dismissing writs of habeas corpus and certiorari sued out by appellant to determine the legality of his detention under a commitment issued by a United States commissioner to hold appellant in custody of the marshal pending the issuance of a warrant for his removal to the District of Columbia to answer an indictment for an alleged violation of the trading-with-the-enemy act of 1917. Indictments were also pending in the southern district of New York charging perjury in the making of reports to said Alien Property Custodian and of conspiracy to omit reporting certain property held on behalf of the German Government and of certain indebtedness thereto. Appellant contended that there was no probable cause to believe him guilty of the offense charged under the Washington indictment, because he could not be required to make report to the Alien Property Custodian of the facts alleged in the indictment since this would compel him in a criminal case to be a witness against himself, contrary to the provisions of the fifth amendment to the Constitution. The Supreme Court decided that appellant's constitutional point was a matter for defense at the trial; that the writ of habeas corpus could not be employed as an anticipatory writ of error; and that the question raised did not go to show want of probable cause. The commissioner found as a matter of fact that the Alien Property Custodian's office was located in the District of Columbia. The court, therefore, declared that the duty was imposed by statute to make report in the District of Columbia and that the failure to make it there was, if proved, an offense against the United States committed in that district. Appellant further contended that his removal to the District of Columbia invaded his constitutional right to a speedy trial on the New York indictment. The Supreme Court

held that on what indictment he should be tried first was a matter within the discretion of the Government. The final order was affirmed.

Blair et al. v. The United States (250 U. S. 273).

Plaintiffs in error and appellants were adjudged guilty of contempt of court because of their refusal to obey an order directing them to answer certain questions asked them before a Federal grand jury inquiring into supposed violations of section 125 of the Criminal Code (relating to perjury) and of the corrupt-practices act of June 25, 1910, in connection with the verification and filing in the Southern District of New York of reports to the Secretary of the Senate of the United States made by a candidate for nomination as Senator at a primary election held in Michigan. They refused to answer the questions propounded on the ground that they were of the opinion that the corrupt-practices act, as amended, was unconstitutional and void in so far as it attempted to regulate and control selection by political parties at primary elections of candidates for United States Senator to be voted for at the regular election; that the authority of Congress under the Constitution extended only to the definitive general election, and further that neither the United States district court nor the Federal grand jury had jurisdiction to inquire into such primary elections or to indict or try any person for an offense based upon the statute. The Supreme Court, in affirming the orders of the lower court, held that a witness is not interested to challenge the jurisdiction of the court or grand jury over the subject matter under inquiry; and that a witness is bound not only to attend the court or grand jury but to tell what he knows in answer to questions framed for the purpose of bringing out the truth of the matter under investigation, provided, of course, they do not tend to incriminate him.

Northern Pacific Railway Company et al. v. State of North Dakota on the Relation of Langer, Attorney General (250 U. S. 135).

This case arose out of the taking over of the railroads by the Government during the period of the war. The court below allowed a peremptory writ of mandamus commanding the Director General of Railroads and the officers of the Northern Pacific to desist from charging for transportation in intrastate business in North Dakota rates fixed by the United States. Further that the director general should thereafter exact for the service stated only the lesser rates fixed by the State utilities commission prior to the bringing of the suit, and which rates could not be changed without the approval of such commission. The Supreme Court held that complete possession and control of the railroads had been given the Government by virtue of the act of Congress of 1916, which authorized the President to take over said roads, the President's proclamation of 1917 in pursuance

thereof, and the act of 1918 dealing with compensation for the period of possession; that the power to make rates was plainly given the President by section 10 of the act of 1918, authorizing him to "initiate rates, fares," etc., by filing same with the Interstate Commerce Commission; that the statutes above mentioned were based upon the Government's war power; and that the Government, having exercised its authority in the premises, the power of the State must be subordinated thereto. The court disposed of the contention that the Government's power to initiate rates must be presumed to be limited to the character of rates which, under existing law, the Interstate Commerce Commission had power to consider—interstate rates—because the new rates when initiated were to be acted upon by that body, by asserting the express grant of power to the commission to consider the new rates in the light of the new and unified control which was created. The court also held that the provisions of section 15 of the act of 1918, designed to protect from the operation of the act local police regulations of the State, could not abridge the all-embracing power to initiate rates fixed by section 10. The decree of the Supreme Court of North Dakota was therefore reversed.

Dakota Central Telephone Company et al. v. State of South Dakota ex rel. Payne, Attorney General, et al. (250 U. S. 163); **Macleod et al., Constituting the Public Service Commission of Massachusetts, v. New England Telephone & Telegraph Company** (250 U. S. 185); **Burleson, Postmaster General, v. Dempcy et al., Constituting the Public Utilities Commission of Illinois, et al.** (250 U. S. 191); **State of Kansas v. Burleson, Postmaster General, et al.** (250 U. S. 188).

The above cases involved substantially the same question—the existence of State power to regulate without the consent of the United States telephone rates for business done wholly within the State over lines taken over during the war period by the United States and which were operated and controlled by it under its governmental authority. The Supreme Court decided that the same principle was involved as in the North Dakota case (250 U. S. 135) mentioned above, in which the authority of the State over intrastate rates in connection with railroads taken over by the Government was denied. It was contended that while complete possession and exclusive control, and the right to all revenues derived from the operation of the telephone lines, were in the United States, yet as to intrastate earnings the State power remained to "encumber" the authority of the United States, resulting from the reservation in general to the States of their lawful police regulations; also by reason of the fact that the subject of stocks and bonds was expressly withdrawn from State control, which would indicate that anything not expressly withdrawn from such control would be saved to it. In this connection the court held that the provision as to stocks and bonds was plainly

inserted to preserve the financial control of the United States over the companies, and further, that as full possession and control of the lines were vested in the Government, there would be nothing upon which the State power could be exercised.

THE ANTITRUST DIVISION.

(C. B. AMES, Assistant to the Attorney General.)

GENERAL STATEMENT.

As stated in the report of my predecessor last year, the activities of the department in the enforcement of the antitrust laws during the period of the war were necessarily curtailed in consequence of the direct intervention of the Government itself in industry, trade, and transportation through the creation of the Food, Fuel, and Railroad Administrations, the War Industries Board, and other extraordinary administrative agencies. With the exception of the Railroad Administration, these agencies are no longer maintained.

The department is now actively engaged in the investigation of a number of complaints of alleged violations of the antitrust laws. Among other things, an exhaustive investigation is being conducted with a view to ascertaining whether the prevailing high cost of living is brought about by agreement, combination, or monopolization by individuals or corporations engaged in interstate commerce. While the scope of this inquiry includes clothing and building materials, it is also directed against the meat packers, who, in addition to the meat business, have extended their operations to include butter, eggs, cheese, rice, and practically all kinds of canned goods. A special legal force has been organized and for several weeks has been engaged in pursuing this inquiry before a grand jury in session at Chicago, Ill.

During the past year 5 cases have been instituted under the antitrust laws—4 civil and 1 criminal; and 9 cases have been finally determined—4 civil and 5 criminal. There are pending at this time 30 cases—16 civil and 14 criminal.

The most important event of the year in relation to this subject was the dismissal by the Corn Products Refining Co., in March, 1919, of its appeal to the Supreme Court from the decree of the district court adjudging it a combination in restraint of trade in starch, glucose, and grape sugar, made from corn, and their derivatives, and in mixed sirups containing 85 per cent, or thereabouts, of glucose.

This action put into full force and effect the decree of the district court, which, after adjudging that the union of competitors on so large a scale through the instrumentality of the Corn Products Co. was a combination in restraint of trade, ordered the dissolution of the combination and enjoined it from further pursuing certain trade practices.

As a step toward compliance with the law, the company had already dispossessed itself by order of the district court of all its interest in the corporation of Penick & Ford (Ltd.), which was one of its principal competitors in sirups. By a further order, entered by the district court on March 31, 1919, the company was directed, with all possible diligence and in any event not later than January 1, 1921, to sell to entirely independent interests (a) its plant at Granite City, Ill., (b) its plant at Davenport, Iowa, (c) all its holdings in the National Starch Co., with plants at Oswego, N. Y., and (d) all its holdings in the Novelty Candy Co., which, according to the charge of the bill, it had used to coerce the patronage of candy manufacturers. This leaves the company with plants at Argo, Ill.; Pekin, Ill.; and Edgewater, N. J., only.

The decree further provided that if these properties shall not have been disposed of within the time specified, they are to be sold at public auction to the highest bidder, and that if at the expiration of three years the measures therein directed and those directed by the previous decrees in the case have not proved adequate in the opinion of the Government to restore competitive conditions in trade and commerce in starch, glucose, and grape sugar, made from corn and their derivatives, and in mixed sirups, and to bring about a situation in harmony with law, the Government shall have the right to such further relief in the present case as may be necessary to that end.

The group of cases pending in the Supreme Court, in which arguments have been deferred during the last two terms on account of conditions caused by the war, will be argued during the present term. Among the more important cases pending in the Supreme Court are those against the Reading Co., the Lehigh Valley Railroad Co. (the so-called Anthracite cases), and the United States Steel Corporation, which were argued early in October, and the Eastman Kodak Co., the American Can Co., and the Southern Pacific Co. The issues in these cases have been stated in previous reports.

CASES FINALLY DETERMINED.

ICE-CREAM CONE CASE.¹

The American Cone & Wafer Co. was charged in a petition filed against it in the northern district of Ohio on July 31, 1918, with entering into a combination to procure the adherence of jobbers to uniform resale prices for its product, commonly called ice-cream cones, by means of contracts and by refusing to make further sales to jobbers failing to adhere to such prices. The case was not contested and the practice complained of was enjoined in a decree entered on August 3, 1918.

¹ While this case was instituted and disposed of during the fiscal year covered by this report, it was also included in last year's report, as it arose before that report went to press.

CANTALOUPE EXCHANGE CASES.¹

The Western Cantaloupe Exchange and others were indicted in the northern district of Illinois in August, 1914, charged with having entered into a combination in restraint of interstate trade and commerce in cantaloupes raised in the Imperial Valley of California. The United States attorney reached the conclusion that the evidence in the case would not enable the Government to secure a conviction, and recommended that the indictment be dismissed and the desired relief sought through a bill in equity. This course was adopted, and on November 9, 1918, a decree was entered enjoining the defendants, among other things, from holding any membership or interest in the exchange and from taking any concerted action to limit or regulate competition between themselves and to enhance the price of cantaloupes in the markets of the United States.

CHICAGO LABOR UNION CASES.

Several indictments were returned in January and April, 1915, against certain so-called business agents of Chicago labor unions charging them with combining and conspiring to prevent the unloading in Chicago of goods shipped from other States. The trial of one case resulted in a verdict of guilty, and in December, 1918, the defendants were fined amounts aggregating \$2,500. The following March the remaining cases were disposed of on pleas of guilty and nolo contendere and fines aggregating \$2,000 were imposed.

KLAXON HORN CASE.

The form of contract which the Klaxon Co. required jobbers handling its warning signals or horns to enter into was the subject of a suit instituted in the district of New Jersey, in December, 1918. Among other things, the contract stipulated that the company would distribute its product through jobbers, selling to them at a certain discount from its published list prices, and the jobbers in turn agreed to resell at the prices fixed by the company. This resulted in the suppression of competition and the maintenance of uniform prices. The Klaxon Co. consented to the entry of a decree enjoining it from entering into any similar contract or agreement in the future.

JENSEN CREAMERY CASE.

The Jensen Creamery Co. and others were charged in an indictment returned in the district of Idaho, in February, 1917, with combining and conspiring to restrain and monopolize interstate trade

¹ While this case was instituted and disposed of during the fiscal year covered by this report, it was also included in last year's report, as it arose before that report went to press.

and commerce in creamery and dairy products in the Northwestern States. In February, 1919, the Jensen Co., the principal defendant, entered a plea of guilty and was fined \$7,500. The remaining defendants were acquitted.

AUTOMOBILE ACCESSORIES CASE.

The principal manufacturers and jobbers of automobile accessories in the United States entered into a combination through the instrumentality of the National Association of Automobile Accessory Jobbers, to control the entire trade in automobile accessories and eliminate all competition therein. The parties to this combination were indicted in the southern district of New York in August, 1917, a demurrer to the indictment was overruled in May, 1918, and after an extended trial the defendants were acquitted in February, 1919.

CORN PRODUCTS CASE.

The Corn Products Refining Co. in March, 1919, dismissed its appeal to the Supreme Court from the decree of the District Court for the Southern District of New York adjudging it a combination in restraint of trade and ordering its dissolution. This left the decree of the District Court as the final decree in the case and the parties agreed upon and the court entered an order to carry that decree into effect. (See ante, pp. 53-54.)

PHILADELPHIA TILE DEALERS CASE.

An indictment was returned in the eastern district of Pennsylvania in December, 1917, against Belfi et al., charging the defendants with combining and conspiring to prevent persons other than themselves and the concerns which they represent from engaging in business as retailers of tiles. Among other things, the defendants became officers and members of the Philadelphia Tile, Mantel & Grate Association; refused to admit as members concerns desiring to engage in the tile business in competition with them; refused to buy from manufacturers who sold to nonmember concerns; induced members of the Tile Layers' Union to threaten manufacturers to refuse to set their tiles if sold to nonmembers; and entered into an oral agreement and understanding with representatives of the Tile Layers' Union under which the latter were not to set tiles for nonmembers. On April 8, 1918, a verdict of guilty was returned against all of the defendants. The court granted a motion for a new trial as to 11 of the defendants and the Government dismissed the case as to them; the court imposed fines aggregating \$9,000 against the 10 remaining defendants and they appealed to the circuit court of appeals. The appeal was argued in November, 1918, and reargued in March, 1919.

In June, 1919, the judgment of the lower court was affirmed except as to two of the defendants. The final result of the case was eight convictions and fines aggregating \$8,000.

COLGATE CASE.

The Supreme Court in June, 1919, affirmed the judgment of the District Court for the Eastern District of Virginia sustaining a demurrer to an indictment returned in that district in December, 1917, against Colgate & Co. The indictment charged that the defendant indicated to wholesale and retail dealers by letters and circulars and orally the prices it desired to have maintained on its products and that dealers failing to maintain such prices were placed on so-called "suspended lists" and refused further supplies until they gave assurance that the prices indicated would be observed.

PENDING CASES INSTITUTED PRIOR TO JULY 1, 1918.

United States v. Reading Company et al.—(Anthracite Coal Combination.)—The decision of the district court in this case was favorable to the Government in substantial part, i. e., it was held that the union through a holding company of the Philadelphia & Reading Coal & Iron Co. and the Lehigh & Wilkes-Barre Coal Co.—two of the great anthracite coal-producing companies—is a combination in restraint of trade. In some important respects, however, the decision was adverse to the Government. Both the Government and the defendants appealed to the Supreme Court. The case was argued during the October term, 1916, and restored to the docket for reargument; it was reargued during the October term, 1917, and again restored to the docket for reargument; and it was postponed during the October term, 1918, on account of unsettled conditions caused by the war. Reargument was heard at the beginning of the October term, 1919, and a decision is awaited.

United States v. Lehigh Valley Railroad Co. et al.—The petition in this case charged that the Lehigh Valley Railroad, in combination with affiliated corporations, has monopolized trade and commerce in anthracite coal produced along and transported over its lines, in violation of the antitrust act; and that the same railroad is transporting in interstate commerce anthracite coal in which it has an interest, in violation of the commodity clause of the act to regulate commerce. The district court dismissed the petition, whereupon the Government appealed to the Supreme Court. The case was argued during the October term, 1916, and restored to the docket for reargument; it was reargued during the October term, 1917, and again restored to the docket for reargument; and it was postponed during the October term, 1918, on account of unsettled conditions caused

by the war. Reargument was heard at the beginning of the October term, 1919, and a decision is awaited.

United States v. United States Steel Corporation et al.—In conformity with the adverse decision of the circuit judges, sitting as a district court, a decree dismissing the Government's petition in this case was entered in September, 1915. The Government appealed to the Supreme Court and the case was argued in March, 1917. On May 21, 1917, it was restored to the docket for reargument. It was postponed during the October term, 1917 and 1918, on account of unsettled conditions caused by the war. Reargument was heard at the beginning of the October term, 1919, and a decision is awaited.

United States v. Eastman Kodak Company et al.—A decision favorable to the Government was handed down in August, 1915, and a decree granting the relief sought was entered in January, 1916. The defendants appealed to the Supreme Court. The hearing there has been postponed from time to time for reasons heretofore stated. The case is being prepared for argument during the present term of court.

United States v. American Can Company et al.—The District Court handed down an opinion in this case on February 23, 1916, and on July 7, 1916, a decree was entered adjudging that the American Can Co. was organized as a combination in restraint of trade. However, the only relief granted was the retention of the bill, i. e., keeping the combination under the supervision of the court. Considering that to be inadequate, the Government appealed to the Supreme Court. The hearing there has been postponed from time to time for reasons heretofore stated. The case is being prepared for argument during the present term of court.

United States v. Southern Pacific-Central Pacific Railway Company et al.—Under the provisions of the expediting act this case was argued before three circuit judges sitting as a district court. In an opinion filed March 9, 1917, this case was decided adversely to the Government, one judge dissenting. The Government appealed to the Supreme Court. The hearing there has been postponed from time to time because the properties of the defendants are being operated by the Government.

United States v. Quaker Oats Company et al.—This case was heard by three circuit judges under the expediting act. The decision of the majority was against the Government, one judge dissenting. The Government appealed to the Supreme Court. The hearing there has been postponed from time to time for reasons heretofore stated. The case is being prepared for argument during the present term of court.

United States v. Associated Billposters et al.—The defendants were charged with entering into a combination and conspiracy in restraint of trade and commerce in posters. A decision favorable to the Government was handed down in the district court in March, 1918, and

a decree granting the relief sought was entered in July, 1916. The defendants appealed to the Supreme Court. The hearing there has been postponed from time to time for reasons heretofore stated. The case is being prepared for argument during the present term of court.

United States v. Keystone Watch Case Company et al.—This case is pending in the Supreme Court on cross appeals from the decision of the lower court, which was in part favorable and in part adverse to the contentions of the Government. It is being prepared for argument during the present term of court.

United States v. American Sugar Refining Company et al.—This is a proceeding against an alleged combination in restraint of trade in the manufacture and sale of sugar. The case was ready for argument in October, 1915, when the court ordered that the hearing be postponed awaiting the decisions of the Supreme Court in the Harvester and Steel cases.

United States v. United Shoe Machinery Company et al.—This proceeding is pending in the eastern district of Missouri and involves the question whether the so-called tying clauses in a series of leases used by the defendants in the conduct of their business are violative of section 3 of the Clayton Act. Among other proceedings, a motion to dismiss the petition, involving largely the merits of the case, has been overruled. The taking of testimony has been completed and the case is ready for trial.

United States v. Michael Boyle et al.—These cases comprise two indictments, one against Boyle et al., and one against Feeney et al., and both charge a conspiracy between certain agents of labor unions and certain manufacturers in Chicago to prevent the installation in Chicago of electrical appliances and lighting fixtures manufactured elsewhere. The trial of the case against Boyle and others resulted in a verdict of guilty, and on March 22, 1917, the defendant, Boyle, was sentenced to one year in jail and fined \$5,000; one defendant was sentenced to 60 days in jail and fined \$500; and the remaining defendants were fined amounts aggregating \$13,000. All defendants appealed to the circuit court of appeals, which affirmed the judgment of the district court in April, 1919. The defendants made application for a rehearing, which was denied. In July, 1918, the court entered an order staying the mandate until further order by the court. The trial of the Feeney case is awaiting the outcome of the Boyle case.

United States v. Cowell et al.—District of Oregon. Indictment returned October 27, 1916, charging certain officers and agents of nine cement manufacturing companies with engaging in a combination to restrain, and with monopolizing, interstate trade and commerce in cement on the Pacific coast. Among other things the indictment alleged that the defendants apportioned territory and maintained

uniform prices. On April 30 and December 10, 1917, a majority of the defendants entered pleas of guilty and were fined amounts aggregating \$17,500. As to the remaining defendants the demurrers interposed by them were overruled and the case was tried in October, 1919. The jury after a conference of twelve hours was unable to agree upon a verdict.

United States v. Chicago Mosaic & Tiling Co. et al.—Northern District of Illinois. Indictment returned May 5, 1917, charging defendants, each a member or a representative of a member of the Chicago Mantel & Tile Contractors' Association, with combining and conspiring to restrain interstate trade and commerce in wall and floor tiles. Among other things, the defendants refused to deal with nonmembers, induced manufacturers to refuse to sell tiles to nonmembers, maintained uniform prices, etc. Demurrers overruled February 12, 1918. The case is now awaiting trial.

United States v. New England Fish Exchange et al.—District of Massachusetts. Petition filed June 21, 1917, charging defendants with combining to restrain and monopolize interstate commerce in the products of the New England fish industry. Among other things, it is alleged that practically all the fish brought in on the North Atlantic coast is marketed through the defendants, and that they have entered into agreements involving the fixing of maximum prices for buying and minimum prices for selling fish. The taking of testimony was completed in October, 1918, and an expediting certificate having been filed the case was tried before three judges in November, 1918. A decision favorable to the Government was handed down July, 1919, and pursuant thereto a preliminary decree ordering the dissolution of the combination was entered on September 13, 1919. The plan of dissolution is now under consideration.

United States v. M. Piowaty & Sons et al.—District of Massachusetts. Indictment returned May 24, 1917, charging defendants with combining through the instrumentality of the National Onion Association to control the onion crop and regulate the quantity placed on the market in such manner as to bring about a very substantial increase in price. On September 12, 1917, a demurrer was sustained as to the first count and overruled as to the second count. Five of the defendants subsequently entered pleas of *nolo contendere* and were fined amounts aggregating \$1,250. The case is awaiting trial as to the remaining defendants.

United States v. Gilman et al.—Northern District of Illinois. Indictment returned June 2, 1917, charging defendants, each a dealer in eggs and a member of the Chicago Butter & Egg Board, with purchasing large quantities of eggs as dealers and then concertedly adopting and following a practice of making fictitious trades among themselves on the board at prices higher than the true market prices,

thereby artificially enhancing the price of eggs throughout a large section of the country. Demurrer was overruled in February, 1918, and the case is awaiting trial.

United States v. Nash Brothers et al.—District of North Dakota. Indictment returned July 30, 1917, charging defendants with combining and conspiring to restrain and monopolize interstate trade in fruit in certain States in the Northwest. Among other things, the indictment charges that the defendants sought to prevent their competitors from purchasing fruit from growers and distributors, and cut prices to cause them to sustain losses in the sale of any fruit so purchased. A demurrer to this indictment was overruled in September, 1917, but on consideration of the opinion of the court it was deemed advisable to seek a new indictment. A new indictment was returned on February 27, 1918, and a demurrer thereto was overruled in March, 1919. The Government has appealed to the Supreme Court.

United States v. Ironite Co. et al.—Southern District of New York. Indictment returned May 10, 1918, charging defendants with conspiring to restrain and monopolize interstate trade in pulverized, powdered, or finely divided iron or other like metal or metal containing material used in or in connection with concrete construction work. Among other things, it is alleged that the defendants agreed among themselves to eliminate all competition and from time to time agreed to fix, establish, raise, and maintain uniform prices, discounts, terms of credit, and policies, and to limit the territory in which certain dealers might sell. This case is being prepared for early trial.

United States v. A. Schrader's Son (Inc.).—Northern District of Ohio. Indictment returned June 19, 1918, against A. Schrader's Son (Inc.), manufacturer of valves and valve parts, pneumatic pressure gauges, and various other accessories for use in connection with pneumatic tires on automobiles and other vehicles. The defendant is charged with requiring tire manufacturers and jobbers to whom it sells its products to execute uniform contracts concerning resales and with refusing to sell to those who do not enter into such contracts and adhere to the uniform resale prices fixed by it. In this way it is alleged competition was suppressed and prices to retail dealers and the consuming public were maintained and enhanced. Demurrer sustained in September, 1919. The Government has appealed to the Supreme Court.

United States v. Rockefeller et al.—(New Haven case).—The trial of 11 of the principal defendants in this case was begun in October, 1915, and on January 9, 1916, the jury acquitted 6 of the defendants and reported a disagreement as to the other 5.

United States v. Charles S. Mellen et al.—This indictment charges the defendants with conspiring to prevent the construction by or in

the interest of the Grand Trunk Railway Co. of certain lines of railroad in New England, thereby forestalling threatened competition with the New Haven system.

United States v. Simpson et al.—District of Columbia. Indictments returned in April, 1917, charging defendants with entering into an agreement as to the prices at which they would sell milk in the District of Columbia during the months of May to September, inclusive, 1916, and in pursuance of which uniform and increased prices were fixed and maintained.

United States v. Isaac Whiting et al.—(2 cases).—The indictments in these cases charge the defendants with conspiring to restrain and monopolize trade in milk throughout the New England States. Some of the defendants have entered pleas of *nolo contendere* and the case against them has been continued pending disposition of the case against the remaining defendants.

CASES INSTITUTED SINCE JULY 1, 1918.

United States v. The American Cone & Wafer Co.—(Ice Cream Cone case.)—Northern district of Ohio. Petition filed July 31, 1918. (See ante, p. 54.)

United States v. Sumatra Purchasing Corporation et al.—(Sumatra Leaf Tobacco case.)—Southern district of New York. Indictments returned October 7, 1918 (one under the Sherman Act and one under section 73 of the Wilson Tariff Act), charging the defendants with conspiring to control the entire trade and commerce in the purchase of Sumatra leaf tobacco in foreign countries and the importation of same into and the sale thereof throughout the United States, and to eliminate competition in and monopolize said trade and commerce, and to increase the price of said tobacco in the United States. This case is being prepared for early trial.

United States v. Western Cantaloupe Exchange et al.—Northern district of Illinois. Petition filed November 9, 1918. (See ante, p. 55.)

United States v. Klaxon Company.—District of New Jersey. Petition filed December 8, 1918. (See ante, p. 55.)

United States v. The Atlas Portland Cement Company et al.—Petition filed August 13, 1919, in the District Court, District of New Jersey, charging the defendants with combining and conspiring, through the instrumentality of the Cement Manufacturers' Protective Association, to curtail the production of cement, to reduce the quantity of cement sold under contract for future delivery at a fixed price, and to bring about a uniform and materially increased price for cement regardless of the point of delivery.

CASES UNDER THE ACT TO REGULATE COMMERCE.**1. UNDER THE COMMODITY CLAUSE.**

In the cases against the Lehigh Valley Co. and the Reading Co., under the Federal antitrust laws, referred to above, the defendants are also charged with transporting anthracite coal in which they have an interest in violation of the commodity clause.

The Lehigh Valley case was decided against the Government by the district court on the authority of the decision of the District Court for the Eastern District of Pennsylvania in the case of *United States v. Delaware, Lackawanna & Western R. R. Co. et al.* The latter case, however, has since been reversed by the Supreme Court. The Lehigh Valley case was appealed to the Supreme Court, was argued there in October, 1916, reargued in November, 1917, and in June, 1918, was again restored to the docket for reargument. It was reargued at the beginning of the October term, 1919, and a decision is awaited.

In the Reading case the decision, in so far as it related to alleged violations of the commodity clause, was also adverse to the Government. An appeal was taken to the Supreme Court, where the case was argued in October, 1916, reargued in November, 1917, and in June, 1918, was again restored to the docket for reargument. It was reargued at the beginning of the October term, 1919, and a decision is awaited.

2. REBATES AND UNLAWFUL DISCRIMINATIONS.

Since the last report 28 cases have been instituted and 63 concluded under the provisions of the act to regulate commerce and the so-called Elkins Act prohibiting the giving or receiving of rebates and discriminations. In the cases concluded, the courts imposed fines aggregating \$215,475.

BUREAU FOR DEFENSE OF CLAIMS AGAINST THE UNITED STATES.

(FRANK DAVIS, JR., Assistant Attorney General.)

By a long series of acts of Congress whereby the United States has submitted itself to suit, any citizen of the United States, or any citizen of a foreign country which allows Americans a reciprocal privilege, may sue the Government of the United States upon any debt, claim, or obligation of a contractual nature, and in respect of patent rights even where the basis of claim is not contractual but tortious. The Court of Claims has jurisdiction of claims "founded upon the Constitution of the United States or any law of Congress, upon any regulation of an executive department, upon any contract, express or implied, with the Government of the United States, or for damages, liquidated or unliquidated, in cases not sounding in tort, in respect of which claims the party would be entitled to redress against the United States either in a court of law, equity or admiralty if the United States were suable."

While the work of this bureau lies mainly in the Court of Claims at Washington, it also reaches into every district court of the United

States by virtue of the concurrent jurisdiction of the district courts in suits against the Government.

The policy of the United States in submitting itself to the suit of its citizens has gone far in many directions to relax customary legal procedure in order that poor claimants may be protected in their rights, even requiring that testimony shall be taken in the county of the residence of the witness, thus bringing the court to the witness rather than the witness to the court. This necessitates sending Government attorneys to all parts of the world.

Suits against the United States originate largely from the numerous contracts made by all departments of the Government. They grow out of the building of battleships, cruisers, and other vessels; the erection of public buildings; the dredging and improvement of rivers and harbors; the building and maintenance of dams, locks, and sea walls; the construction of dry docks; reclamation projects; contracts for Army supplies; contracts with mail contractors and railroad companies for carrying mails; claims for the alleged use and infringement of patented devices, and suits wherein it is contended that an implied contract exists.

A large amount of litigation involves the construction of statutes affecting the pay of the Army and Navy and civil employees of the Government; the reimbursement of disbursing officers for United States funds lost without negligence; cases referred to the court by special acts of Congress relating to dealings with the Indians; so-called cotton claims, filed under section 162 of the judicial act approved March 3, 1911; and numerous claims for property taken under the fifth amendment to the Constitution.

The volume of business before the Court of Claims will be greatly increased by the legislation broadening the powers of the Government in connection with the prosecution of the war. The adjustment of its resultant obligations will eventually bring a large number of suits involving vast sums of money into that court. The most prolific source of this litigation will be the sudden cancellation of contracts for supplies, materials, arms, equipment, buildings, and other public works following the signing of the armistice. It is impossible at this time to even estimate the probable volume of business that will arise therefrom, but some idea may be formed of its amount from the fact that in anticipation of the war and during its progress the Government entered into contracts involving billions of dollars.

In addition to formal contracts canceled by the Government, there were informal contracts and requisitions under the war defense act and other emergency legislation, validated by the act of March 2, 1919 (40 Stat., 1272), amounting to vast sums, in many of which claims have been presented to the Secretary of War as provided by said act with a right to sue in the Court of Claims if the claimants are dissatisfied with the award made by the Secretary.

The new internal-revenue legislation will also furnish a prolific source of litigation in the Court of Claims. Claims for the refund

of internal-revenue taxes filed with the Commissioner of Internal Revenue up to this time amount to many millions, a large percentage of which will unquestionably find their way into the Court of Claims. There will also be a vast number of what are known as Army and Navy pay cases.

The increase in litigation arising from the Civil War and the Spanish War will no doubt appear insignificant, both in volume and importance, as compared with that which will grow out of the World War, its magnitude being already indicated by the suits which have reached the Court of Claims and the district courts.

MISCELLANEOUS SUBJECTS.

The augmented activities in the Department of Justice by reason of the war have brought to this bureau an important class of business connected with contracts and claims which may be said to be allied to the defense of suits against the United States, as numerous controversies can ultimately be determined only by suits in the Court of Claims or district courts. Many of these involve the supervision of the defense of suits brought against Government contractors growing out of the execution of cost-plus contracts, wherein the United States has agreed to indemnify the contractor for all expenses and losses sustained in the execution of the contract. As a judgment against a contractor in this character of litigation may result in additional cost being charged against the contract, to be paid by the Government, it becomes the duty of this department to either defend such suits or to assist counsel for the contractors in the preparation of their defense.

There are also suits to be defended brought by individuals against officers of the Army to recover damages on account of personal injuries sustained as a result of collision with Army trucks, automobiles, and other Army equipment.

Another class of litigation wherein the department is requested to assist in the defense is that represented by suits against Government contractors brought upon contracts previously entered into with individuals and firms for the furnishing of supplies, etc., the contractor's output or plant being later commandeered by the Government, rendering the execution of the original contract impossible. The contractors in these instances contend that they should be held harmless from any judgments which may be rendered against them.

In the construction of public works for the United States Army a large number of personal-injury suits against the contractors and agents of the Government have arisen, aggregating several million dollars, that will also eventually find their way into the Court of Claims, or as claims against the Government in the district courts. To properly protect the Government's interests it is, therefore, necessary to render assistance in the original adjudication of these matters.

An additional class of business assigned to this bureau during the past year is the institution of suits in which the Government is the

party plaintiff. These are suits against defaulting Government contractors; for damages sustained by Government property, such as Army trucks, automobiles, etc., as the result of collision; actions to enjoin municipal authorities from taxing the property of the United States; suits brought at the instance of the Shipping Board for the value of hulls sold on the ways; advances made to Government contractors by the war credit board of the War Department; and suits to recover overpayments by the United States ranging all the way from excessive amounts paid to Government contractors through frauds practiced upon the United States under cost-plus contracts to overpayment of salaries to clerks dropped from Government rolls after the signing of the armistice.

LITIGATION ARISING OUT OF USE BY THE UNITED STATES OF PATENTED INVENTIONS.

The act of June 25, 1910, made the Government liable by suit in the Court of Claims "Whenever an invention * * * covered by a patent of the United States shall hereafter be used by the United States without license of the owner thereof or lawful right to use the same * * *."

The duty of defending suits brought under this law devolves upon this bureau, and the litigation had been steadily increasing even before the entrance of the United States into the war. In the prosecution of the war it became necessary for the Government to directly use many patented inventions, and also to let contracts so that it could immediately obtain articles the manufacture of which necessarily involves the use of patented inventions. This has resulted in claims being made directly against the United States by the owners of patents alleged to have been used. The amount of these claims is enormous. Those made against the Government on its claimed use of patented inventions in radio apparatus alone amount at this time to approximately \$50,000,000. Almost every department of the Government having to do with the production and use of supplies and equipment for the prosecution of the war, necessarily made use, directly or indirectly, of patented devices, so that the amount claimed on account of radio patents gives some idea of the situation existing in the entire patent field. The Supreme Court of the United States held in 1918 that manufacturers of apparatus required and used by the Government must account to the owner of any patent for infringement thereof by such manufacturers. Before this decision it had been the general understanding of manufacturers that they were not liable for infringement if the apparatus manufactured was for Government use, upon the theory that the liability of the Government to the owner of the patent, under the act of 1910, hereinbefore referred to, was his exclusive remedy. The law having been settled as to this, contractors who furnished apparatus covered by patents to the Government on its orders during the war are now being sued for infringement in the district courts throughout the

United States; the suit being directly between the owner of the patent and the contractor, the district courts have jurisdiction and the Court of Claims has not. The contractors claim that any judgment recovered against them for infringement of patents in manufacturing apparatus which they were required to manufacture and deliver to the Government must be paid by the Government, and that it is therefore the duty of the Government to defend these suits. The Government has been required to do this in some instances and probably will be required to do so in many.

The defense of patent suits involves a highly technical branch of the law, and constitutes a very difficult class of litigation. The litigation arising in this field is of great importance. It will occupy much of the time of the Court of Claims during the next few years and will largely increase the responsibilities and labors of this bureau.

After years of hard work on the part of the Court of Claims and of the Department of Justice the dockets of the court have been so cleared that not only pending suits but new business receive prompt attention, and cases are disposed of as rapidly as they are prepared and presented by counsel.

COURT OF CLAIMS.

Summary.

Total amount involved in cases disposed of during the year.....	\$27,076,414.15
Total amount awarded claimants.....	\$638,058.16
Total amount claimed in cases filed during the year.....	\$17,026,587.26
Contested cases disposed of during year.....	477
Number of cases dismissed for want of prosecution.....	419
Total number of cases disposed of.....	896
Total number of new cases filed.....	156
Total number of cases pending.....	544
Approximate amount involved in pending cases.....	\$48,052,021.04

GENERAL JURISDICTION CASES.

General jurisdiction cases are those in which claimants sue directly in the Court of Claims under the Judicial Code, and the court's judgments, subject to appeals to the Supreme Court, are final.

There are now pending in the Court of Claims 491 general jurisdiction cases.

Since the last report petitions have been filed in 152 cases, the amount claimed being, approximately, \$16,934,602.26.

During the year the court passed upon 874 cases, involving, as far as can be ascertained from the petitions, \$26,019,362.91.

In 772 cases, claiming \$24,665,963.97, judgments were in favor of the Government. In 102 cases, claiming \$1,699,176.89, there were awards in favor of claimants in the sum of \$637,999.81.

Of the cases decided in favor of the Government 205, claiming \$378,975.50, were dismissed under authority of the decision of the Supreme Court in the case of *James H. Cochnower v. The United States*.

Cases disposed of during year.....	874
Amount claimed in cases disposed of.....	\$26, 019, 362. 91
Amount recovered by claimants.....	\$637, 999. 81
Cases filed during the year.....	162
Approximate amount claimed in them.....	\$16, 934, 602. 26
Number of cases now pending.....	491
Approximate amount claimed in them.....	\$40, 840, 610. 33

CONGRESSIONAL CASES.

Congressional cases are before the court by reference of Congress under the acts of March 3, 1883, and March 3, 1887, commonly known as the Bowman and Tucker Acts, and authority of section 151 of the Judicial Code of March 3, 1911.

During the year the court disposed of 19 of these cases, involving a total of \$704,625.29, findings in which have been or will be reported to Congress.

One case was filed during the year, the amount claimed being \$75,000.

There are now pending 48 cases under this jurisdiction claiming, approximately, \$7,151,850.71.

INDIAN DEPREDAATION CASES.

Indian depredation cases arise under the jurisdictional act of March 3, 1891 (26 Stats., 851), and the amendatory act of January 11, 1915 (38 Stats., 391).

Since the date of the last annual report, at which time there were five cases still pending under the act of March 3, 1891 (26 Stats., 851), and as amended January 11, 1915 (38 Stats., 791), three cases involving a total amount claimed of \$16,985 have been reinstated. Three cases have been tried during the year, in two of which involving \$6,650 the defendants were successful and the petitions dismissed, and in the third a judgment in favor of the claimant for \$300 was awarded. Of the five cases now pending, involving \$49,560, three are or will be ready for trial when the court convenes in October; and, unless the claimants in the remaining two cases are ready to proceed by that time, it is my intention to move to dismiss for nonprosecution.

In addition to the above the claimants in six other cases, involving a total amount claimed of \$42,315, were unsuccessful in their efforts to have the petitions reinstated.

The appeal to the Supreme Court taken by the plaintiff in *Rex, Administratrix, v. The United States et al.*, No. 10842, has not yet been passed upon by that court.

APPEALS TO THE SUPREME COURT FROM THE COURT OF CLAIMS.

During the year 31 cases appealed from the Court of Claims were presented to the Supreme Court, 8 of which were appealed by the United States and 23 by the plaintiffs. Decisions in 15 of these cases were in favor of the Government and 8 against it. The remaining 8 cases have not been decided. In addition motions to remand filed by plaintiffs in 3 cases were opposed by the United States. In 1 case the application was allowed, denied in 1, and in 1 decision has not been rendered.

There are now pending in the Supreme Court 55 appeals from the Court of Claims, 49 of which were taken by plaintiffs and 6 by the United States.

UNITED STATES DISTRICT COURTS.

This bureau is charged with the general supervision of the defense of suits brought against the Government in the various district courts of the United States under the act entitled "An act to provide for the bringing of suits against the Government of the United States" (1 Supp. R. S., 559), as amended by the Judicial Code of March 3, 1911 (38 Stats. L., 1087), as also those suits brought against the United States pursuant to the provisions of various statutes enacted subsequent to the declaration of war which authorize the President to commandeer, requisition, and otherwise take over or control real estate and personal property essential for the maintenance of the Army and Navy in furtherance of the national security and defense. During the year 54 suits were brought in the district courts throughout the United States, involving in the aggregate the sum of \$102,546.09. This is an increase of 43 suits over the previous year.

Under this jurisdiction six cases went to judgment against the United States during the year. In satisfaction of these, Congress, at its last session, appropriated the sum of \$96,362.68, and in satisfaction of three judgments rendered in prior years the sum of \$9,336.10. One case was dismissed and six stand on error to the Supreme Court.

Since the jurisdiction was created 1,769 suits have been brought against the Government, of which 112 are now pending in the district courts.

The foregoing shows a considerable increase over previous years of suits filed in the United States district courts under this jurisdiction.

CRIMINAL DIVISION.

(R. P. STEWART, Assistant Attorney General.)

The present division of the work of the department assigns to this division all criminal matters arising under Federal laws except prosecutions under the food bill, the antitrust act, and violations of the war-time prohibition bill (act of Nov. 21, 1918). In common with the other branches of the department, the work of this division has been greatly increased during the past fiscal year, notwithstanding the lessening of criminal activities growing out of war conditions. The Bureau of Investigation, although independent in organization, by reason of its necessary duties regarding the prosecution and detection of crimes, is at all times in close cooperation with this branch. The work of the two divisions is now so coordinated that satisfactory results will continue to be shown as a result thereof. In addition, this division advises and directs the criminal work of the several United States attorneys, both as to substantive law and procedure, thus establishing a relation of an intimate character of great service to the administration of justice. The following brief

survey of the more important classes of criminal work handled by this division indicates the character of the matters disposed of by it. The total number of criminal cases of all classes, commenced under the direction of this division during the fiscal year, was 47,443, with fines imposed amounting in the aggregate to \$5,632,759, of which there was collected \$1,917,838.29; the number of acquittals was 2,000, and cases dismissed and nol-prossed amounted to 7,954.

CASES ARISING UNDER THE POSTAL LAWS.

Among the more important cases arising under the above laws, attention is invited to the following:

The McAlester Real Estate Exchange and certain of its principal officers were indicted upon the charge of using the mails in furtherance of a scheme to defraud. Their scheme consisted, dominantly, in soliciting persons to employ the company to act as agents for them at alleged auction sales of Indian lands by the Government. In addition to using the mails, they operated a number of cars over the railroads of the country, which cars would be placed upon the side-tracks in various cities, and the local citizens invited to visit the cars and inspect the products of the alleged Indian lands. Through what may be termed "advertising talk" by agents of the company in charge of the cars a large number of persons were induced to employ the company and pay fees for such service. The lands that the purchaser in many instances ultimately received were, in no fair sense, such land as he had been led to believe he would secure. The operations of the company were not only widespread but highly successful. Sixteen of the defendants were convicted, receiving penitentiary and jail sentences.

Albert Le More and Edward E. Carriere were convicted upon the charge of using the mails in furtherance of a scheme to defraud. They had been dealers in staves and as a result of their legitimate carrying on of that business were enabled to subsequently adopt the practice of collecting on bills of lading which had been fraudulently procured by them from the transportation companies, the defendants never having furnished the companies with the staves and never intended to. Large sums of money were, through the fraudulent scheme, lost by those induced to purchase or negotiate the bills of lading. The circuit court of appeals affirmed the conviction, and the Supreme Court of the United States refused to review the case on writ of certiorari.

John J. Shea, convicted of two similar offenses, employed the scheme of inducing persons of wealth to bet large sums of money on so-called fake horse races. His scheme was quite successful. His conviction was also upheld by the circuit court of appeals and further review on writ of certiorari refused by the Supreme Court of the United States.

James Dorsey, also convicted of a similar offense, employed the scheme of selling as high-class, thoroughbred, tuberculin-tested cattle, cattle of common breeding and not tuberculin tested. His conviction was also upheld by the circuit court of appeals and further review on certiorari denied by the Supreme Court of the United States.

W. F. Hallowell, also convicted of a similar offense, adopted the scheme of inducing persons to pay him large sums of money to procure for them tracts of land comprised within the much-litigated Oregon-California grant. Of course the purchasers, under the conditions represented by Hallowell, never could lawfully obtain title to the land, and they thus lost all they paid him for his alleged services in the matter. His conviction was also upheld by the circuit court of appeals and further review refused by the Supreme Court of the United States.

Frederick H. and Henry F. Clarke were convicted of a similar offense. Their scheme was a stock-selling one in an alleged automobile concern, viz, the Kent Motors Corporation. Their conviction was upheld by the circuit court of appeals and further review refused by the Supreme Court of the United States.

James Kenney was convicted upon the charge of submitting false reports of cancellations of postage stamps while a postmaster, for the purpose of increasing his compensation, thus working a fraud upon the United States. His conviction was upheld by the circuit court of appeals and further review refused by the Supreme Court of the United States.

After the conviction of the Standard Home Co. upon the charge of using the mails to defraud, and the imposition of a fine upon the company, the company went into bankruptcy without paying the fine or costs of the prosecution. In the bankruptcy proceedings the Government filed a claim for said fine and costs. The bankruptcy court held that the United States was not entitled to priority of payment, but the circuit court of appeals upheld the right of the United States to recover the costs, viz, \$9,000, as a priority claim, but not the fine. The trustee in bankruptcy is making an effort to procure a further review by the Supreme Court on writ of certiorari.

An indictment has been returned at Chicago, Ill., charging Samuel G. Pandolfo and the Pan Motor Co. with using the mails in furtherance of a scheme to defraud in the sale of stock to the public on an enormous scale. The case is being prepared for trial, which it is now expected will take place during the month of October.

The total number of cases under this head commenced during the fiscal year were 2,092, of which number there were 1,463 convictions, and fines imposed to the amount of \$296,436.57.

ILLICIT DISTILLING.

During the past year the number of cases involving illicit distilling has in certain districts increased to a degree which has in some instances overtaxed the office of United States attorney and caused serious congestion in the court's criminal calendar. While in a few instances it has seemed advisable to recommend acceptance of offers submitted in compromise of this offense, generally speaking in the prosecution of cases of this character no effort has been spared to secure the conviction of the guilty parties, the result of which, it is hoped, will have a wholesome and deterrent effect upon such offenders.

The total number of criminal prosecutions under the internal-revenue laws, including illicit distilling cases, commenced during the fiscal year ending June 30, 1919, is 5,807. There have been 2,590 convictions under this head. The aggregate amount of fines, forfeitures, and penalties on account thereof imposed during that period is \$545,926.13.

MISCELLANEOUS CRIMINAL PROSECUTIONS.

For the fiscal year there have been commenced miscellaneous criminal prosecutions in addition to the other classifications set forth herein to the number of 19,126. There have been 12,166 convictions, and the fines, forfeitures, and penalties imposed in such cases during that period amount in the aggregate to \$1,049,119.83.

INVESTIGATION OF WAR FRAUD MATTERS.

During the present year this division has had referred to it and has conducted, through the Bureau of Investigation, a large number of investigations of cases growing out of shipyard and munition plant contracts. Up to the present writing 25 shipyard and munition plant cases involving alleged fraud are being investigated. Many of the above-mentioned cases involve alleged misapplication of millions of dollars. In view of the fact that a number of these cases necessitate undercover investigations, it is not thought advisable to mention the specific cases by name.

Complaints charging irregularities in shipyards and munition plants are continually coming in and are being handled as rapidly as the facilities of the Bureau of Investigation will permit. Because of the tediousness and great length of time required to make these investigations, few of them have been as yet completed.

During the past year there have been reported to this division by the Treasury Department approximately 5,000 cases of alleged fraud under the War Risk Insurance Act. These cases are being investigated, and in a number of instances we have been able to uncover fraud before actual payment of money by the Treasury Department, and in many other cases have been able to recover checks before they had been made use of. Five hundred of these cases have been fully investigated and records thereof sent to the various United States attorneys for prosecution.

ENFORCEMENT OF THE WHITE-SLAVE TRAFFIC ACT.

During the past fiscal year there have been 261 convictions under the white-slave traffic act, 19 acquittals, 80 cases nolle-prossed, and there were 494 cases pending at the close of said fiscal year. The imprisonment imposed aggregates 332 years, 2 months and 10 days, and the total amount of fines imposed totals \$35,002. These figures show a decrease of 91 convictions, a decrease of 21 acquittals, and a decrease of 56 cases nolle-prossed. There has also been a marked decrease in the number of indictments returned covering this offense.

The decrease in the number of indictments returned and convictions secured is attributable mainly to the fact that this class of prosecutions has, during the greater part of this last year, necessarily had to await prosecution of cases growing out of offenses against the war statutes, which undoubtedly required more immediate and careful attention. The above statement is further substantiated by a reference to the fact that at the end of the past fiscal year there were pending 494 cases, or an increase of 83 more cases pending than at the end of the fiscal year 1918.

The total number of convictions under this act, from the date of its passage up to the end of this fiscal year, were 2,459; acquittals, 342; and cases nolle-prossed, 532. The imprisonment imposed has aggregated 3,591 years, 3 months and 11 days; and the fines, \$249,672.63.

VIOLATIONS OF NATIONAL BANKING LAWS.

During the fiscal year ending June 30, 1919, 189 cases of alleged violations of the banking laws of the United States were reported to the department for investigation. Thirty-five cases of this character, embracing 39 defendants, were brought to trial during the same period, resulting in the conviction of 32 persons and 7 acquittals. During the previous year 48 cases involving 52 defendants were tried, 45 of these defendants being convicted and 7 acquitted.

INTERNAL REVENUE, TAX, PROHIBITION, AND MISCELLANEOUS MATTERS DIVISION.

(WILLIAM L. FRIERSON, Assistant Attorney General.)

LIQUOR LAWS.

Numerous cases were prosecuted in the district courts for violation of the law known as the Reed amendment, which prohibits the shipment of intoxicating liquors into dry States, as well as under section 240 of the Penal Code, regulating the shipment of liquor in interstate commerce. Two cases under the Reed amendment reached the Supreme Court during the year. One was decided in favor of the Government's contention that the transportation of liquor into a State whose laws prohibited the sale or manufacture of liquor for beverage purposes is unlawful, even though the laws of the State permit such liquor in limited quantities to be brought in for personal use. In the other the decision was against the Government's contention, which was that the Reed amendment prohibited the transportation of liquor into a State the laws of which prohibited its manufacture or sale for beverage purposes even though it be carried into the State only for the purpose of being transported through to another State in which the sale or manufacture is not prohibited.

The war prohibition act of November 21, 1918, prohibiting the use of fruit and food products in the manufacture of beer, wine, or other intoxicating malt or vinous liquors for beverage purposes, went into effect as to the manufacture on May 1, 1919. The provision of the act against the sale of liquors did not go into effect until July 1, 1919,

and therefore was not in effect during the year for which this report is made. Prior to May 1, manufacturers of beer commenced an action in the District Court for the Southern District of New York against the United States district attorney and the collector of internal revenue seeking to enjoin the enforcement of the law upon the ground that the act was unconstitutional, or, if not unconstitutional, that it did not prohibit the manufacture of beer unless such beer was in fact intoxicating, it being alleged that beer containing not more than $2\frac{3}{4}$ per cent of alcohol was not in fact intoxicating. This suit was earnestly resisted upon the ground that the act was constitutional and prohibited the manufacture of beer regardless of the amount of alcohol it contained and made it unnecessary for the Government to prove in any case as a matter of fact that the beer in question was intoxicating. The district judge held that the act was constitutional, but, being of opinion that under its terms the Government must prove in each case that the beer was intoxicating, granted a preliminary injunction restraining the district attorney from commencing prosecutions for the manufacture of beer containing not more than $2\frac{3}{4}$ per cent of alcohol. The circuit court of appeals, however, reversed the decree granting the injunction against the district attorney, holding that the act was constitutional and that the court was without jurisdiction to enjoin the district attorney from commencing prosecutions under a constitutional act of Congress upon the allegation that he was misconstruing the act.

SAFETY-APPLIANCE ACTS.

During the fiscal year 15 cases, involving 73 counts, were transmitted to the several United States attorneys for prosecution. Cases aggregating 57 counts were tried, of which 49 counts were decided in favor of and 8 counts adversely to the Government, and 1 count pending in a district court from last year having been decided in favor of the Government, making a total of 58 counts decided during the year. There were 273 counts confessed and 81 dismissed. There were 24 counts pending on appeal in the circuit courts of appeals at the beginning of the fiscal year, 14 of which were appealed by the Government and 10 by a carrier, all of which were decided in favor of the Government excepting 2 counts, which are now before the Supreme Court. During this year there were but 4 counts appealed, this action being taken by one of the carriers on the retrial of the case. There are now pending in the various district courts 70 cases involving 215 counts.

HOURS-OF-SERVICE ACT.

During the fiscal year there were transmitted to the several United States attorneys for prosecution 10 cases, involving 61 counts. Cases aggregating 21 counts were tried, of which 2 counts are pending

decision, 2 counts were decided in favor of and 17 adversely to the Government, of which 17 counts 16 have been appealed. There were also 42 counts decided against the Government on demurrers to defendants' answers. There were 461 counts confessed and 46 counts dismissed. In the various circuit courts of appeals there were decisions in 3 cases involving 23 counts, all of which were decided in favor of the Government. In 2 cases decided by the Supreme Court involving 29 counts, the decisions were in favor of the Government, and certiorari was denied in 2 cases, involving 120 counts, wherein the decision of the Circuit Court of Appeals was favorable to the Government. Pending trial in the various district courts are 71 cases involving 651 counts.

ASH-PAN ACT.

There were no violations of this act reported to the United States attorneys during the past year, and there are no cases now pending.

TWENTY-EIGHT-HOUR LAW.

During the year penalties aggregating \$109,850 were recovered for 849 violations of this act. Cases involving 20 violations were determined adversely to the Government, and there were dismissals by the Government as to 112 counts. There are now pending in the district courts cases involving 2,037 counts. During the year there were transmitted to the United States attorneys for prosecution charges and preliminary proofs of 1,711 violations.

FOOD AND DRUGS ACT.

During the year 1,588 cases were transmitted to the United States attorneys, 413 of which were criminal and 1,175 civil. The 413 criminal cases embraced 860 alleged violations of the food and drugs act.

At the close of the fiscal year 1918 there were pending 398 cases, of which 188 were criminal prosecutions and 210 were seizures.

Two hundred and fifty-four cases pending at the close of the fiscal year 1918, and 765 reported during the fiscal year 1919, in all 1,019, were terminated in 1919. Of those terminated, 271 were criminal and 748 were civil.

In 244 of the 271 criminal cases fines were imposed amounting to \$18,160. Most of these cases were disposed of by pleas of guilty or nolo contendere. There were trials in only 2 resulting in convictions and 1 of these is now pending on appeal; in 6 collateral deposited by defendants was forfeited by reason of their nonappearance in court. In 1 the judgment of conviction in the lower court was reversed by the circuit court of appeals; in 3 there were acquittals; 22

were nolle prossed or the information dismissed; and 1 was withdrawn from prosecution.

Of the 748 civil cases terminated during the year decrees of condemnation and forfeiture or informal orders for the disposition of the property were entered in 667, of which 5 were decided favorably to the Government after contest; in 30 the libels were dismissed; in 44 the packages were broken or disposed of before seizure could be made; and in 7 verdicts were returned for the claimant after trial to the court and a jury. In the 667 cases in which decrees of condemnation and forfeiture were entered the goods were destroyed in 340; released on bond or otherwise in 266; and sold in 61. In many of the cases in which the product was ordered released or sold, the decree of the court provided that the product should be sorted and that that portion found unfit for food should be destroyed.

At the close of the year 967 cases were pending, of which 330 were criminal prosecutions and 637 were seizures.

INSECTICIDE AND FUNGICIDE ACT.

Cases charging 89 violations of this act were terminated during the year, 83 of which were criminal and 6 civil. Fines were imposed in 69 cases, amounting to \$2,342. There are now pending prosecutions for 95 violations, 87 of which are criminal and 8 civil. During the year 104 cases were transmitted to the United States attorneys, 90 of which were criminal and 14 civil.

MEAT INSPECTION ACT.

Fines aggregating \$1,306 were imposed for 27 violations of this act. Cases involving 10 violations were dismissed, 2 nolle prossed, and in 4 cases grand juries refused to find a "true bill." There were pending at the close of the year cases involving 31 violations. During the year there were reported to the United States attorneys 26 alleged violations.

ANIMAL QUARANTINE ACT.

Three hundred and thirty-four cases were terminated during the year, 269 resulting in convictions and fines aggregating \$27,000. In 65 cases a nolle prosequi was entered, and in 2 cases the grand juries failed to indict. Twenty-seven alleged violations were reported to the United States attorneys during the year and 150 alleged violations were referred to the Director General of Railroads for appropriate action, 66 of which had been given consideration by him at the close of the year.

PLANT QUARANTINE ACT.

Four cases were reported to the United States attorneys during the year. At the close of the fiscal year 1918 there were 14 cases pending. Three cases which were closed prior to the beginning of the fiscal year 1918 were not reported to this office until too late for their inclusion in the annual report. Of the four new cases, one was withdrawn upon the request of the Federal Horticultural Board; one other case was nolle prossed. There are now 15 cases pending.

VIRUS ACT.

At the beginning of this year there were three cases pending under this act, and during the year one additional case was reported, all of which were pending at the close of the year.

LACEY ACT.

Twenty-three cases under this act were terminated during the year, with convictions in 17 cases and fines aggregating \$1,917. Twenty-nine cases were pending at the close of the year. Twenty-six alleged violations of this act were reported during the year to the United States attorneys.

MIGRATORY BIRD TREATY ACT.

The treaty with Great Britain for the protection of migratory birds was proclaimed by the President December 8, 1916. On July 3, 1918, the President approved the act of Congress to carry the treaty into effect, and on July 31, 1918, approved and proclaimed the regulations adopted by the Secretary of Agriculture to give effect to the act. Since this time 296 cases have been reported to the United States attorneys for prosecution, and convictions and the imposition of fines aggregating \$2,230 have been secured in 110 of these cases. There have been no adverse decisions.

BIRD RESERVATION TRESPASS.

Six cases were reported to the United States attorneys during the year. At the close of the preceding fiscal year 17 cases were pending, of which 6 were closed during this fiscal year, 5 by convictions and the imposition of fines amounting to \$315, and 1 by trial to the jury and a verdict of not guilty. Of the 6 cases reported during the year 1 was closed, a jury trial resulting in the acquittal of the defendant. Sixteen cases were pending at the close of the year.

KILLING OF GAME IN NATIONAL FORESTS.

In the 53 cases instituted on account of hunting or killing of game animals in the national forests in violation of the rules and regulations, 34 defendants were found guilty and fined, and sentences ag-

gregating 55 days in jail were imposed; 3 were dismissed because defendants were out of the State; 2 defendants were found not guilty; 1 case was dismissed for lack of evidence; 2 were continued; 2 were dismissed; and 9 are awaiting trial.

CASES ARISING OUT OF ORDERS OF THE INTERSTATE COMMERCE COMMISSION.

Eastern Texas Railroad Co. v. Railroad Commission of Texas, western district of Texas, is a suit in which by a cross bill the Railroad Commission of Texas sought an injunction against an order of the Interstate Commerce Commission in what is known as the "Shreveport case." (234 U. S. 342.) The district court denied the motion of the railroad commission for interlocutory injunction against the order and granted the motion of the carriers for interlocutory injunction to prevent the railroad commission from interfering with them in their acts in complying with the order. (242 Fed. Rep. 300.) The case was referred to a special master. He took testimony and found that the order was entered before the commission on the petition of the Railroad Commission of Louisiana, and that jurisdiction did not lie in the western district of Texas on the cross bill of the Railroad Commission of Texas to enjoin it. Exceptions were filed by the attorney general of Texas to that report and the case is fixed for hearing at the January term, 1920.

Seaboard Air Line Railway Co. v. United States, eastern district of Virginia, is a suit to set aside an order of the commission which directed certain trunk-line carriers to cease and desist from practicing the discrimination of absorbing or nonabsorbing switching charges on traffic delivered to industries, the only distinction being that of competitive conditions existing at the points where the traffic originated. The district court denied application for interlocutory injunction and dismissed the petition. (249 Fed. Rep. 368.) The carriers appealed to the Supreme Court where the case is now pending.

Chestnut Ridge Railway Co. v. United States, middle district of Pennsylvania, is a suit to enjoin an order fixing divisions between the petitioner and the trunk lines. On hearing and after opinion of the district court, the case was reopened and continued for additional record which has been supplied. The case is now awaiting final decision.

The National Tube Co. v. United States, northern district of Ohio, was a suit to set aside the order of the commission directing the trunk line carriers to cease and desist from paying switching allowances to the Lake Terminal Railroad Co., which serves the plants of the National Tube Co. and Carnegie Steel Co., the three companies named being subsidiaries of United States Steel Corporation. On hearing, September 17, 1918, on application for interlocutory in-

junction, the court held that the question of the reasonableness of the allowances was not fairly in issue in the hearing before the commission and that the parties had not had full opportunity to be heard on that subject. Accordingly, without going into the merits of the case, the order of the commission was enjoined. Subsequently, the commission, on its own motion, struck off the order and refixed the case for hearing before the commission. Thereupon the court dismissed the petition on the ground that the case had become moot. The question is still pending before the commission.

Alaska Steamship Co. et al v. United States, southern district of New York. On April 14, 1919, the Interstate Commerce Commission issued an order prescribing uniform bills of lading for adoption by the various railroad and steamship companies operating within the jurisdiction of the commission. (52 U. C. C. 671.) Numerous railroad and coastwise steamship companies filed a petition to annul and enjoin the order, alleging, first, that the commission had no power or authority to prescribe the forms of the bills of lading; and, second, that if it had such power or authority, it had exercised it arbitrarily. On July 3, 1919, on application for interlocutory injunction, the court enjoined the order of the commission, solely on the first ground with a full opinion, one judge dissenting. An appeal was taken to the Supreme Court of the United States where the case is now pending.

PUBLIC LANDS DIVISION.

(FRANK K. NEBEKER, Assistant Attorney General.)

ENFORCEMENT OF THE PUBLIC AND INDIAN LAND LAWS.

On June 30, 1918, there were pending in the trial courts 360 civil and 62 criminal cases¹ affecting public lands. During the year ended June 30, 1919, 126 civil and 57 criminal cases were instituted and 177 civil and 68 criminal cases were disposed of, leaving 309 civil and 51 criminal cases pending June 30, 1919. Of the civil cases terminated, 106 were decided in favor of the Government, 31 were compromised, 22 were lost, and 18 were discontinued. In the criminal cases, 44 defendants were convicted or pleaded guilty, 34 were discharged on orders of nolle prosequi, and 12 were discharged by acquittal. Damages were recovered during the year in the sum of \$201,235.45 and \$5,986.88 in fines imposed. Title to 67,310 acres

¹ In the following pages relating to litigation over public and Indian lands the term "case" is used to designate a single legal proceeding (which may involve one or several distinct transactions), with this exception: Many of the proceedings referred to under the head "Suits to cancel unlawful conveyances of Indian allotments, Five Civilized Tribes," involve large numbers of conveyances and defendants claiming thereunder. The proceedings are in course of being disposed of in parts, and, therefore, as a matter of convenience in referring to them, the word "case" is used to indicate the individual transaction rather than the suit in which it has become involved.

of land was recovered, and unlawful inclosures of 12,510 acres of public land were abated. (See Exhibit 17.)

At the beginning of the fiscal year 1919 there were 40 cases involving public lands pending in the circuit courts of appeals and 12 were docketed in those courts and 16 disposed of during the year, leaving 36 pending on June 30, 1919. The Government won 11 of the cases disposed of and lost 5. There was also pending at the beginning of the year in the Court of Appeals of the District of Columbia 1 public-land case. Nine cases were docketed and 5 disposed of—4 in favor of the Government and 1 adversely to it—in that court during the year leaving 5 cases pending on June 30, 1919.

In the Supreme Court of the United States there were pending on June 30, 1918, 12 cases involving public lands, and during the year ended June 30, 1919, 7 additional cases were docketed and 7 decided—all in favor of the United States—leaving 12 pending in the Supreme Court on June 30, 1919.

On June 30, 1918, there were pending in the trial courts 1,181 civil and 11 criminal cases involving Indian lands. During the year ended June 30, 1919, 173 civil and 18 criminal cases were begun and 515 civil and 8 criminal cases terminated, leaving 839 civil and 21 criminal cases pending on June 30, 1919. Of the civil cases disposed of 249 were terminated favorably to the Government, 34 adversely, 134 were compromised, and 98 were discontinued. In the criminal cases 7 defendants were convicted or pleaded guilty, 3 were discharged on orders of nolle prosequi, and 2 were discharged by acquittal.

There were 16 cases involving Indian lands pending in the United States circuit courts of appeals on June 30, 1918, and 14 were docketed and 15 terminated in those courts during the fiscal year 1919, leaving 15 pending on June 30, 1919. Of the cases terminated 11 were in favor of and 4 adverse to the United States. There were also pending on June 30, 1918, in the Court of Appeals of the District of Columbia 7 cases affecting Indian lands and 3 such cases were docketed and 3 disposed of during the fiscal year 1919—all in favor of the Government—leaving 7 cases pending on June 30, 1919.

In the Supreme Court of the United States there were pending on June 30, 1918, 8 cases affecting Indian lands. During the year ended June 30, 1919, 6 such cases were docketed in that court and 7 disposed of—all in favor of the Government—leaving 7 cases pending on June 30, 1919.

More detailed reports as to certain of the more important litigation follow.

OREGON AND CALIFORNIA RAILROAD LAND GRANT SUIT.

Preceding annual reports show the disposition of the main forfeiture suit involving this land grant by the enactment of the Chamberlain-Ferris law of June 9, 1916 (39 Stat., 218), which revoked the land grant and substituted a money grant of \$2.50 per acre. That act authorized and directed the filing of a suit to secure a judicial determination of the amount of money already received by the railroad company on account of the land grant and properly chargeable against it as a part of the full value conferred by the granting acts; and as stated in my last annual report, that suit was filed December 27, 1917.

The defendants' answers have been filed and as they do not contest the Government's claim of title to the unsold lands by virtue of the revestment act of June 9, 1916, the only matters in dispute are items of expense incurred by the railroad company, for which it claims credit, moneys received on account of the land grant, and the total area with which the company is entitled to be credited at the rate of \$2.50 per acre. All these matters are susceptible of proof by records and counsel for the Government and the defendants are preparing a statement of the facts to be stipulated in the case. It is hoped that this statement can be completed and the case submitted to the court during the coming fall.

In addition to the main forfeiture suit instituted against the railroad company involving the unsold lands the Government, in 1909, under the joint resolution of April 30, 1908, instituted 46 other suits against the company and those who had purchased lands from it in violation of the restrictive provisions of the granting acts.

The act of August 20, 1912 (37 Stat., 320), provided that if the purchaser defendants would consent to decrees declaring their titles forfeited to the United States and satisfy the Attorney General that they had actually made their purchases in good faith, they might purchase the lands from the United States by paying \$2.50 an acre therefor.

Most of these cases were settled under that act several years ago, the defendant purchasers availing themselves of the privilege of perfecting their titles by paying the Government \$2.50 per acre. During the year ended June 30, 1919, the two remaining suits were disposed of by decrees setting aside the contracts of purchase and declaring the lands to be unsold lands within the meaning of the Chamberlain-Ferris Act of June 9, 1916.

In this connection it should be stated that two of the defendant purchasers, the Booth-Kelly Lumber Co., and Hammond & Winton, who availed themselves of the privileges afforded by the act of 1912 and thereby acquired perfect title to the lands that they had illegally

bought from the railroad company, brought suits, in the circuit court of the State of Oregon for the county of Multnomah, against the railroad company on account of the alleged failure of their titles. The Booth-Kelly Lumber Co. sued to recover from the railroad company the sum of \$192,837.10, being the entire amount that that company had paid to the railroad company for the lands that it had purchased; while Hammond & Winton sued the railroad company to recover the sum of \$114,932.50, which they had paid to the United States under the act of 1912. These causes were heard together on demurrers filed by the railroad company and at this hearing a representative of the Government filed a memorandum suggesting that the United States was interested in the controversies, inasmuch as it proposed to hold the railroad company to an accounting for all money that it had received on account of the land grant, and contended, therefore, that the purchasers were not entitled to recover. The circuit court for Multnomah County, three judges sitting, rendered an opinion sustaining the demurrers and dismissing the complaints; and both parties have appealed to the supreme court of the State where the cases are now pending. It is believed that a hearing in these cases will be had during the present year at which time the interests of the United States will again be suggested and defended.

THE COOS BAY WAGON ROAD GRANT.

The last annual report shows that the litigation involving this grant was then pending in the Supreme Court, but that the defendant had submitted a proposition looking to the settlement of the case on terms to be approved by Congress and that bills for that purpose were then pending in both the Senate and House.

By the act of February 26, 1919, Congress authorized the acceptance of the defendant's proposition and pursuant to that act a deed reconveying to the United States approximately 93,000 acres of land, was delivered to and accepted by me. For this area the defendants were paid \$2.50 per acre and in addition thereto the Government assumed the obligation to pay the taxes that had been allowed to accumulate on the lands since 1908. These taxes with penalties and interest will amount to approximately \$450,000, an amount in excess of that stated in the last annual report, as additional taxes have since accrued. In return, however, the Government has become revested with undisputed title to lands that are worth not less than \$2,000,000, and possibly considerably more.

LITIGATION CONCERNING OIL LANDS RESERVED BY EXECUTIVE ORDER.

This litigation, as has been indicated in previous reports, involves public lands withdrawn by Executive order from all forms of entry. The Government contends that the defendants, who claim the lands,

are trespassers in that their locations were made in fraud of the law or in violation of the withdrawal orders, or both. The lands involved are immensely valuable for their oil and gas.

On July 1, 1918, there were pending in the United States District Courts 52 suits in California, 3 in Wyoming, and 18 in Louisiana. During the year ended June 30, 1919, one suit was instituted in California. During the same period 3 cases were decided on the merits in California, 2 against and 1 in favor of the Government, and 1 in Wyoming against the Government. There were, therefore, pending in the district courts on June 30, 1919, 50 cases in California, 2 in Wyoming, and 18 in Louisiana, an aggregate of 70 suits. In 11 of these pending suits decisions on the merits have been rendered in favor of the Government, as previously reported, and they are pending on reference to a master to determine the damages due the Government.

On July 1, 1918, there was pending in the circuit court of appeals on appeal by the Government one case in California; and during the year ended June 30, 1919, one case from California and one from Wyoming were appealed to the circuit court of appeals by the Government. All three of these cases were pending on appeal on June 30, 1919; the Wyoming case having been argued and submitted, but not decided. Since the close of the fiscal year 1919, one case from California, decided by the district court on the main questions in favor of the Government, has been appealed by the defendants and a cross appeal has been taken by the Government.

The suit against the Honolulu Consolidated Oil Co. remains pending as at the date of my last report, awaiting the action of the Land Department on the company's applications for patents. In the proceedings in the Land Department the decision of the register and receiver favorable to the Government was reversed by the Commissioner of the General Land Office as to 13 quarter sections and the Navy Department's protests affecting those quarter sections dismissed; and was sustained as to the remaining 4 quarter sections involved on the ground that the locations were "dummy" in character. Appeals were taken to the Secretary of the Interior on behalf of the Navy Department as to the protests dismissed and by the Honolulu Co. as to the other 4 quarter sections. These appeals were argued before the Secretary on July 9, 10, and 11, 1919, and his decision is at this writing awaited.

In my last report reference was made to the institution of new suits in place of three cases which had been dismissed without prejudice because of the insufficiency of the showing made on behalf of the Government. In the new suits a receiver was appointed as to most of the defendants and a commissioner was appointed to supervise operations and other relief granted as to the other defendants.

In three other cases a commissioner was appointed to supervise all operations of the defendant Standard Oil Co., and in two additional suits a receiver was appointed. In one of these cases there is no production, the suit being instituted and a receiver put in charge with a view to stopping the flow of water in an abandoned well which is destructive of the oil sands. In all of these cases where a receiver or commissioner has been appointed injunction has been granted against further drilling pending decision by the Land Office on applications for patent.

In 3 of the 11 cases in California which were referred to a master, the master's reports have been filed and settled, all exceptions on both sides having been disposed of. Final decrees will be entered in the near future. In 2 of these cases the master's reports have been filed and exceptions thereto heard, but not decided by the court. In all but one of the remaining cases referred to the master the accounting is complete, or practically so.

During the year* protests have been filed in the Land Office at Visalia, Calif., on behalf of the Navy Department against the granting of patents upon applications embracing 25 quarter sections in naval petroleum reserve No. 2 and 28 quarter sections in naval petroleum reserve No. 1. Much evidence has been taken in support of these protests, but much more remains to be taken.

There are in California 29 cases in which a receiver or commissioner has been appointed and is now in charge, and 17 in which injunctive and other relief have been granted without receiverships.

In the California suits there was on June 30, 1919, impounded in the hands of receivers an aggregate of \$17,370,799, of which \$4,357,000 represents production from the lands involved in the suit against the Honolulu Consolidated Oil Co. The greater part of the impounded funds has been invested in Liberty bonds.

Preparations are practically complete for the institution of several additional suits for the protection of the Government's interests in valuable oil lands in Wyoming.

The so-called "Ferry Lake cases," in Louisiana, involve lands lying adjacent to Ferry Lake and embraced in the Executive withdrawal order of December 15, 1908, and the confirmatory order of July 2, 1910, which had been referred to a master for findings on the law and the facts prior to the fiscal year 1919, were argued before the master on July 1, 1918. On January 11, 1919, the master filed his opinions and recommendations in 17 cases, holding the Government entitled to recover for the oil and gas extracted, but allowing defendants' counterclaims for the cost of drilling and operation. The findings and conclusions of the master in the remaining case, all in favor of the United States, were filed April 7, 1919. On May 26, 1919, argument was had before the United States District Court for the

Western District of Louisiana, on exceptions by both Government and defendants to the master's recommendations, the Government excepting to the allowance of defendants' counterclaims. In an opinion filed July 17, 1919, the court confirmed the master's findings in all respects, and decrees in accordance therewith were on August 4 signed. By these decrees the Government's title to the land is established, free of any and all claims of defendants, and it recovers an aggregate of \$462,903.39, with interest at the rate of 5 per cent per annum from the respective dates of the filing of the master's reports; also a receiver is appointed to take charge of and operate the wells, and injunctions are granted against further trespass. Some of the defendants have already appealed and others doubtless will appeal; while, on the other hand, the Government will appeal from the allowance to defendants of the cost of drilling and operation. Since the close of the fiscal year 1919, four additional suits have been filed in Louisiana involving land and oil and gas alleged to be worth \$400,000.

As stated in my last annual report, the general policy followed by the department in this litigation has been to protect the naval reserves from further trespasses, in furtherance of the policy of the Navy Department to have a reserve of oil in the ground for future production; and with respect to the withdrawn lands outside of the naval reserves, to encourage production wherever it could wisely be done provided the net proceeds be impounded to await the final determination of title. This policy will be continued unless and until Congress shall by legislative expression direct otherwise.

SUITS AGAINST THE SOUTHERN PACIFIC RAILROAD COMPANY CONCERNING OIL LANDS.

These are seven suits instituted in the southern district of California to cancel patents issued to the Southern Pacific Co. and alleged to have been procured by fraud, in that the company represented to officials of the General Land Office that the lands involved were nonmineral whereas they were, in fact, and were known by the company, to be, valuable oil lands. The suits have been fully described in previous reports. The first one tried, known as the "Elk Hills case," involving some 6,000 acres, was decided in the district court in favor of the Government, but on appeal to the circuit court of appeals, the decision below was reversed. The Government took the case to the Supreme Court where it was argued and submitted at the last term; but a decision has not yet been rendered.¹

The remaining six cases, involving approximately 150,000 acres, were consolidated for hearing, argued and submitted to the district court in April, 1918, and, on August 28, 1919, decision was handed down adverse to the United States. The Government is perfecting an appeal.

¹ Since the above was written the Supreme Court has decided this case in favor of the Government.

THE OKLAHOMA RIVER BED CASES.

These suits have been fully described in previous reports. They involve conflicting claims of the Creek and Osage Tribes of Indians, Indian allottees claiming riparian proprietorship and the State of Oklahoma and its lessees to portions of the beds of the Arkansas and Cimarron Rivers in Oklahoma, worth many millions of dollars for their oil and gas. The Government's contentions on all points have been sustained by the district court in two of the cases in the western district of Oklahoma, which were, at the date of my last report, and are still pending on appeal by the defendants, in the circuit court of appeals. The other suits, pending in the eastern district of Oklahoma, are awaiting the result of these appeals. On account of the extension of the proven oil and gas field in the Creek country, additional portions of the river beds have been leased to operators by the State and have been brought into these suits by supplemental bills, and it will doubtless be necessary to file additional supplemental bills as other portions of the river beds are leased by the State.

SUNK LAND CASES IN ARKANSAS.

These are suits brought to quiet the Government's title to considerable areas of valuable lands in Arkansas which were erroneously designated by early surveys as "lakes," while, as a matter of fact, they were lands in place, temporarily overflowed at the time of survey by flood waters of the Mississippi. Since my last report two additional cases have been terminated by the entry of decrees quieting title in the United States to 54,882.20 acres of the approximate value of \$2,000,000. In three suits still pending, involving 25,581.32 acres, the evidence on the part of the Government has been taken and it is now expected that the defendants will complete their testimony in the near future and that the cases will be disposed of at the November, 1919, term of court. It is probable that two or three additional suits will be instituted during the present fiscal year and these will practically complete this litigation, which thus far has resulted entirely in favor of the Government.

WATER RIGHTS.

The trial of the suit brought by the Government to adjudicate the water rights in that part of the Truckee River flowing in Nevada was begun on August 4 last and the United States has finished its case in chief. It is expected that a decree will be obtained before the beginning of the irrigation season of next year.

During the year the measures looking toward a more extensive use of Lake Tahoe as a reservoir by the United States, including the obtaining of data and the carrying on of negotiations with the

riparian land owners, have been receiving the attention of the Interior Department, and pending their conclusion the litigation affecting the use of the lake by the United States has remained practically as last reported. Preparations have been made by this department for possible additional litigation in case these negotiations fail.

The suit by the Government against the Ramshorn Ditch Co. and water officials of the State of Nebraska, referred to in my last report, has been decided in favor of the Government and an injunction to protect the Government's use of the waters in question has issued. The case involves seepage waters on the North Platte reclamation project.

By cooperation between the Interior Department and attorneys of this department a plan has been worked out looking to the undertaking by the United States of a project for the irrigation of about 60,000 acres of Indian lands and private lands on the Gila River in Arizona under a special provision in the Indian appropriation act of May 18, 1916. Under that legislation the project was only to be undertaken if the Secretary of the Interior should be able to make or provide for a satisfactory adjustment of existing Indian and private water rights and should declare the project feasible. A form of contract under which those rights would be determined and the project undertaken and operated has been executed by a large percentage of the owners of the private lands and water rights that would be affected, and if the remaining preliminaries can be successfully concluded the project will be declared feasible and the work on it begun. The cooperation of this department in the matter is at the request of the Secretary of the Interior and with a view to avoiding litigation that would otherwise be necessary to determine and protect the water rights of the Gila River Indian Reservation.

The two suits brought to protect the water rights of the Indians of the Uintah Basin in Utah have remained as last reported, with the courts protecting the Indians' rights and the Government ready for trial at any time. Meanwhile the legal positions of the Government have been strengthened and the issues greatly narrowed as a result of the actual application to beneficial use on Indian lands, during the past two years, of all but a small percentage of the water covered by reservations and appropriations. They have been still further narrowed by the Government's obtaining a three-year extension of the time in which to apply to beneficial use the rest of the water covered by its permits under the State law. The grounds upon which the defendants have been opposing the Government's demands in these suits having been thus largely cut away, the possibility of settling the cases by the entry of consent decrees is being considered by the representatives of all the parties and there is reasonable prospect of the cases being disposed of in that way.

The original suit in the Supreme Court of the United States between the States of Wyoming and Colorado, in which the United States participated on invitation of the court, referred to in my last report, has not yet been decided.

Other important matters in connection with water rights have been receiving the attention of the Government attorneys. Some of them are not yet in litigation and negotiations are being had with a view to a settlement out of court.

OCCUPATION OF NATIONAL FORESTS BY POWER COMPANIES.

The five cases against the Utah power companies have been kept pending as they were at the date of my last report awaiting compliance by the companies with the departmental regulations requiring them to file applications for power permits to occupy portions of certain forest reserves. The companies have been permitted to delay filing applications for such permits because of their hope of relief from the enactment of proposed water power legislation, which, however, failed to pass at the last session of Congress. They have now been called upon by the Department of Agriculture to file applications for permits under the departmental regulations, as required by the decisions of the courts in these cases.

THE PUEBLO OF SANTA ROSA CASE.

The case of the pueblo of Santa Rosa against the Secretary of the Interior and the Commissioner of the General Land Office was brought January 28, 1915, in the Supreme Court of the District of Columbia. In it the plaintiff, an alleged community of Papago Indians, claiming title in fee under the laws of Spain and Mexico, the treaty of Guadalupe Hidalgo, and the Gadsden treaty to 720 square miles of land in Pima County, Ariz., sought to enjoin the defendant officials from disposing of any portion of the tract involved under the public land laws. Defendants denying that plaintiff owned the fee or had any other or better title than the ordinary Indian right of occupancy and possession, moved to dismiss on the showing made by the bill. This motion was sustained by the trial court and the bill dismissed on April 25, 1916. On appeal by plaintiff to the Court of Appeals of the District of Columbia, the finding by the trial court was on April 27, 1917, reversed and defendants permanently enjoined as prayed. Defendants then appealed to the Supreme Court of the United States where, on March 3, 1919, the decision of the Court of Appeals was reversed and the case remanded to the Supreme Court of the District of Columbia for a new trial. A further motion to dismiss, supported by numerous affidavits, has been filed in the Supreme Court of the District of Columbia on the ground that the suit is unauthorized by the alleged plaintiff or by any individual or tribal Papago Indians,

and is in fact one against their interests and not for their benefit. An answer has also been filed setting up the full facts and alleging that the suit is brought for the ultimate purpose of securing to certain interested individuals title to one-half of more than 2,600,000 acres of land now within the Papago Indian Reservation. The case also involves interesting and important questions as to the title rights of Indians coming under the sovereignty of the United States by the Gadsden purchase, and is regarded as one of exceptional importance.

SUITS TO CANCEL UNLAWFUL CONVEYANCES OF INDIAN ALLOTMENTS.

(A) FIVE CIVILIZED TRIBES.

My last report showed that there were 2,946 cases pending July 1, 1918. Of these 2,010 were disposed of during the fiscal year 1919, resulting in the recovery for the Indians of 285,360.88 acres, of which 191,803.05 acres were recovered by decree and 93,557.83 acres without trial due to the defendants quitclaiming, the approval of the conveyances by the proper county court or the Secretary of the Interior, etc. In addition cases embracing 86,320.96 acres were dismissed because the lands involved were found to be unrestricted or included in another suit, or because of erroneous description; thus there was eliminated from the litigation during the year 371,681.84 acres. This necessitated the preparation and entry of 1,445 decrees and 1,121 orders of dismissal, some of the conveyances embracing one or more full allotments or portions of several allotments belonging to as many different allottees.

In view of the proviso to that portion of the sundry civil bill for the year ending June 30, 1920, appropriating funds for the conduct of this litigation, which provides "that said suits shall be advanced upon the docket and their trial expedited," I wish to set forth a little more fully than I would ordinarily do what has been accomplished since the suits were filed.

The litigation originally embraced 301 suits in equity, filed in July, 1908, to cancel deeds to Indian allotments upon which agreements with the Five Civilized Tribes and the statutes of the United States impose restraints upon alienation. There were involved all told 27,517 conveyances, constituting in effect that many separate cases; so that the word "case" as used with reference to this litigation means the action on an individual conveyance rather than the suit in which it has become involved. Four test cases were as speedily as possible carried through to the Supreme Court, where decisions were rendered in 1912 (see 224 U. S. 413; *id.* 448; *id.* 458; *id.* 471) sustaining the right of the United States to bring suits to annul conveyances of allotments alleged to have been made in viola-

tion of the restrictions referred to and in so doing to join as defendants large numbers of persons claiming under similar conveyances but having no community of interest. The questions of alienability were determined favorably to the Government's contentions in one case (224 U. S. 413) and for the most part adversely in the other three. Following these decisions large numbers of cases controlled thereby were eliminated; many others were dismissed because the defendants quitclaimed the lands in controversy to the Indians or because of settlements otherwise made in favor of the allottees; and still others were dismissed because the information upon the faith of which some of the conveyances were attacked proved incorrect. The settlement of additional questions raised in several other cases, all of which were taken to the Circuit Court of Appeals and one to the Supreme Court, delayed final action on large numbers of the remaining cases, but they have been disposed of as rapidly as has been consistent with the lapse of time necessary for the appeals referred to and the collection and consideration of the facts in each case which have entailed an immense amount of labor. Of the 27,517 original cases, involving 3,842,553.80 acres, 26,581 had been disposed of prior to July 1, 1919, clearing the title to 3,705,358.43 acres and leaving but 936 pending at that date embracing 137,195.37 acres. Approximately 50 per cent of the remaining cases can be disposed of upon presentation to the court without contest on questions of fact as rapidly as the necessary data become available. The remaining 50 per cent involve disputed questions of fact, chief among them questions of heirship; and in many of them the defendants have died, necessitating a revivor against the heirs or the dismissal of the present bills and the institution of new proceedings against the proper parties.

As the bulk of this work has decreased the special force engaged upon it has been reduced until at present it is handled by two special attorneys and two clerks. In pursuance of the direction of Congress that the remaining suits be advanced upon the docket and their trial expedited, the necessary instructions have been issued to the attorneys in charge of the litigation, and it is the hope and expectation of the department that the major portion of the remaining cases will be disposed of during the present fiscal year.

(B) ALLOTMENTS IN THE WHITE EARTH INDIAN RESERVATION.

These are suits to clear the title to certain allotted lands of the Indians of the White Earth Reservation, in Minnesota. Full details thereof will be found in previous reports. At the beginning of the fiscal year 1919 there were 616 suits pending, and during the year 20 additional suits were instituted and 226 terminated, leaving 410 pending June 30, 1919. In 86 of the suits disposed of, decrees were

entered clearing title in the Indians, while 124 cases were dismissed on payment by defendants of an additional consideration insuring the Indians a fair value for their land, in accordance with the plan for the settlement of a large part of these cases, outlined on page 51 of my annual report for 1916, making a total of 210 cases in which the objects of the litigation were attained. There were thus restored to the Government during the year, in trust for the Indians, 6,906.61 acres of land valued at approximately \$65,000, and \$130,385.35 recovered and paid to the Department of the Interior for their benefit. The remaining 16 cases were dismissed because it was ascertained that the allottees were mixed bloods and had received fair value.

Tentative agreements have been made for the settlement of about 100 suits in which final decrees had not been entered on June 30, 1919.

Settlement out of court has been made of matters affecting 74 allotments and a total additional consideration of \$34,060.51 recovered without legal proceedings. In four of these matters 320 acres, valued at \$3,200, were reconveyed to the allottees.

The total value of the recovery for the Indians during the year, lands and money, is \$232,645.86.

SUITS TO CANCEL ILLEGAL ALLOTMENTS.

The case of *United States v. Hettie Lena, alias Emma Coker et al.*, referred to under this head in my last report, was argued and submitted to the circuit court of appeals on June 4, 1919, but has not yet been decided. It involves the title to 160 acres of land in the Creek Nation and the Government contends, on behalf of the Creek Tribe, that it was erroneously allotted in the name of Emma Coker and seeks to cancel the allotment patents and to restore the land to the tribe. The land is being operated for oil and gas and is worth approximately \$2,500,000. The royalty from production, which at this writing amounts to \$45,598.41, is deposited with the superintendent of the Five Civilized Tribes pending the outcome of the suit.

The case of *United States v. Minnie Atkins et al.*, also referred to in my last report, will probably be submitted to the circuit court of appeals at the December, 1919, term. This case also involves 160 acres alleged to have been erroneously allotted in the name of Thomas Atkins. It is valuable for its oil and gas, said to be worth \$3,000,000, and the Government seeks to restore it to the Creek Tribe. Pending suit the property is being operated under a bond of \$900,000 in lieu of a receivership.

Several similar suits pending in the district court will be controlled by the final decisions in the Hettie Lena and Minnie Atkins cases.

REPORT OF ATTORNEY IN CHARGE OF TITLES.

(CHARLES S. LAWRENCE.)

During the fiscal year ended June 30, 1919, there were rendered 573 opinions dealing with titles to lands acquired by the United States by purchase and condemnation and with miscellaneous questions of law connected therewith.

The cost of the lands thus acquired aggregated \$6,285,852.55.

An investigation was made of the title to the dock properties belonging to North German Lloyd and Hamburg-American at Hoboken, for which \$7,146,583 was awarded by the President.

In addition, abstracts were examined preparatory to the institution of numerous cases in condemnation now pending for acquisition under the Weeks forestry law, and for other purposes. The value of the land thus to be acquired can not now be definitely stated.

Appropriations made by the Congress have been utilized to an unusual extent for the acquisition of lands for military purposes needed in the prosecution of the war. In consequence, a very large part of the attention of the title division has been given during the year to condemnation of lands for military uses and to legal questions growing out of the legislation enacted for this purpose.

REPORT OF THE ATTORNEY IN CHARGE OF LAND LITIGATIONS IN THE DISTRICT OF COLUMBIA.

(HENRY H. GLASSIE.)

The proceedings for the condemnation of land for the approaches of the new Key Bridge across the Potomac, begun just before the close of the previous fiscal year, were completed under the immediate conduct of the department, and opinions rendered upon the title to the parcels acquired thereunder.

Under an act authorizing the Secretary of War to execute conveyances for that purpose, the department's tentative agreement with the Pennsylvania Railroad Co. for the compromise of litigation concerning lands along the Anacostia River was consummated in a manner which gave the Government all the city water front claimed, and about half a mile of frontage on the opposite bank of the river.

In *United States v. Marine Railway and Coal Company*, a test case involving the territorial boundary between the State of Virginia and the District of Columbia, as well as of the Government's title to land reclaimed in front of Alexandria, a judgment was rendered in favor of the Government, and the cause is now on appeal.

Investigation was made of legal questions connected with the improvement of the Potomac River, as well as those relating to the expropriation of the North German Lloyd and the Hamburg-Amer-

ican Docks, by the President's proclamation of June 28, 1918, and the settlements thereby rendered necessary.

CUSTOMS CASES.

(BERT HANSON, Assistant Attorney General.)

The following table shows numerically the volume of litigation during the year in the Court of Customs Appeals, as compared with others, since the establishment of that court:

	1910	1911	1912	1913	1914	1915	1916	1917	1918	1919
Cases decided on argument:										
Won by the United States.....	106	133	132	116	99	82	75	50	36	37
Won by the importers.....	74	89	83	60	70	76	42	56	25	20
Total.....	180	222	215	176	169	158	117	106	61	57
Issues involved in the above cases decided on argument:										
Won by the United States.....	68	113	126	110	97	79	70	49	33	35
Won by the importers.....	46	75	71	55	65	56	42	44	24	17
Total.....	114	188	197	165	162	135	112	93	57	52
Percentage won by the United States...	59.6	60.1	64.0	66.7	59.9	58.5	62.5	52.7	57.9	67.3
Cases decided without argument:										
Won by the United States.....	112	212	244	41	36	18	22	17	11	4

REPORTS OF SOLICITORS.

TREASURY.

(LAWRENCE BECKER.)

The report of the Solicitor of the Treasury shows that in 1,694 of the civil suits instituted during the fiscal year the Government sought the recovery of specific amounts in the sum of \$3,563,435.71, including claims forwarded to this office for suit to the amount of \$41,304.48, but which were settled without suit; and that judgments in favor of the United States were rendered in certain classes of suits instituted during the year and prior thereto, amounting to \$709,440.37. Collections and deposits in these civil miscellaneous suits and claims amounted to \$590,662.57.

In addition, fines aggregating \$5,249,338.25 were imposed in 12,121 of the criminal cases instituted during the year, and fines collected and deposited during the fiscal year in these cases amounted to \$1,565,530.90. Claims were settled by compromise upon the payment of the sum of \$469,001, and there was deposited in the Treasury from unclaimed moneys remaining over five years in court registries, under sections 996 and 4545, Revised Statutes, the additional sum of \$53,555.38, making the total amount collected and deposited in the Treasury under the direction of this office \$2,678,749.85.

There were 11,828 official bonds, contracts, leases, etc., examined and 91 written opinions given and other matters disposed of which can not well be tabulated.

COMMERCE.

(ALBERT LEE THURMAN.)

SUMMARY OF WORK DONE DURING THE FISCAL YEAR ENDED JUNE 30, 1919.

Legal opinions rendered, formal and informal (memorandum).....	258
Contracts examined (approved, disapproved, drafted, redrafted, modified, involving expenditures amounting to \$1,541,221).....	217
Contracts examined (indeterminate amounts).....	18
Contract bonds examined (approved, disapproved, drafted, redrafted, modified, amounting to \$323,796).....	108
Official bonds examined, approved or disapproved (amounting to \$590,500)...	115
Leases examined (approved, disapproved, drafted, redrafted, modified, involving the sum of \$423,938).....	91
Revocable licenses examined (approved, disapproved, drafted, redrafted, modified, amounting to \$3,801).....	20
Insurance policies examined, amounting to \$137,400.....	6
Deeds examined (approved, disapproved, drafted, redrafted, modified, in the sum of \$3,305).....	2
Legislative matters which concern the Department of Commerce (drafting and redrafting of bills, reports relative thereto, etc.).....	366
Miscellaneous matters, embracing everything submitted for the advice or suggestion of the Solicitor, or for the formulation of departmental action, not included in the foregoing items.....	1,534

LABOR.

PRISONS, PARDONS, AND PAROLES.

(DENVER S. DICKERSON, Superintendent of Prisons.)

UNITED STATES PENITENTIARIES, TRAINING SCHOOLS, AND BUREAU OF CRIMINAL IDENTIFICATION.

The number of prisoners confined in the United States penitentiaries at Atlanta, Ga.; Leavenworth, Kans.; and McNeil Island, Wash.; St. Elizabeths Hospital, Washington, D. C.; The National Training School for Boys and The National Training School for Girls, and in State institutions other than county jails—that is to say, the major offenders—was 4,788 on June 30, 1919, as compared with 4,482 on June 30, 1918, an increase of 306. This increase is due to war conditions, the number of military prisoners having largely increased, and there being numerous offenders against the selective-draft act, the espionage act, and other laws growing out of the war.

Of this 4,788, 3,852 were confined in the United States penitentiaries, 240 in State and Territorial penitentiaries, 201 in State reformatories and training schools, 228 in The National Training School for Boys, 4 in The National Training School for Girls, 143 in St. Elizabeths Hospital, and 120 in miscellaneous institutions such as workhouses and houses of correction.

(A) PENITENTIARY AT ATLANTA, GA.

The average daily population during the fiscal year 1919 was 1,549; in 1918 it was 1,268. There were 49 deaths, 36 more than during the previous year; 40 deaths were due to influenza and its complications during the epidemic which swept the country during the fall and winter of 1918. The average yearly cost of maintenance per man was \$281.33; in 1918 it was \$289.60. The daily cost per man

was \$0.77; in 1918 it was \$0.793. This decrease is due to curtailment of repairs and improvements, due in turn to an inadequate appropriation, and which if continued will result in deterioration of the plant. The total cost of maintenance during 1919 was \$435,-784.53, the total expenditures being \$494,309.16, the difference, \$58,524.63, representing supplies on hand at the close of the year.

During the year the prisoners were employed in the construction of new prison buildings and of the building to house the new cotton-duck mill, the installing of machinery in the duck mill, the cultivation of the prison farm, and the usual institutional duties. The farm produced supplies of the value of \$31,277.93, at a cost of \$6,980.60, exclusive of the salary of the farmer, making a net profit of \$24,297.33, as compared with a net profit of \$15,929.55 for the preceding year.

During the year substantial progress was made in the construction of the east main cell wing. This wing is nearly completed. Its completion will complete the construction of the institution as originally planned many years ago. The construction of the building to house the cotton-duck mill was completed during the year. This building, of reinforced concrete and brick construction, covers an area of almost 3 acres. It has been pronounced by experienced builders and cotton-mill men to be one of the best of its kind in the country. Substantial progress was made during the latter half of the year in the installation of the equipment. It is believed the entire mill will be ready to operate by November 1, 1919, although it is intended to start up the machines a few at a time, as they are made ready for the work.

In accordance with section 6 of the act approved July 10, 1918, the following report on the duck mill and farm is submitted:

Material and supplies purchased from the operating fund to June 30, 1919.

Material used:

9 gallons heavy loom oil, at 23 cents.....	\$2. 07	
23 gallons red engine oil, at 24½ cents.....	5. 64	
10 gallons transil oil, at 36 cents.....	3. 60	
27 gallons spindle oil, at 21 cents.....	5. 67	
17 gallons Alpha loom oil, at 21 cents.....	3. 57	
94 gallons gasoline, at 24 cents.....	22. 56	
		\$43. 11

Material on hand:

Wrapping paper.....	111. 09
Burlap.....	260. 00
Baling strap iron and tie buckles.....	122. 76
Baling needles.....	. 85
Stencils.....	2. 00
49 gallons Acme comb box oil.....	20. 09
59 gallons heavy loom oil.....	13. 57
43 gallons red engine oil.....	10. 54

Material on hand—Continued.

10 gallons transil oil.....	\$3. 60
102 gallons spindle oil.....	21. 42
97 gallons Alpha loom oil.....	20. 37
109 gallons gasoline.....	26. 16
	\$612. 45

Amount on hand June 30, 1919.....	569. 34
-----------------------------------	---------

Yarn purchased and on hand June 30, 1919:

18,902 pounds 13/1, at 60 cents per pound.....	11, 341. 20
11,919.75 pounds 16/1, at 62 cents per pound.....	7, 390. 25
	18, 731. 45

Persons employed:

Superintendent of duck mill, Jan. 1 to June 30, inclusive, 6 months..	3, 750. 00
Mill electrician, Jan. 1 to June 30, inclusive, 6 months.....	900. 00
Overseer of weaving, Mar. 3 to June 30, inclusive, 3 months and 25 days.....	655. 56
Overseer of twisting, Apr. 7 to June 30, inclusive, 2 months and 21 workdays.....	420. 00
Loom fixer, Mar. 3 to June 30, inclusive, 103 workdays.....	412. 00
	6, 137. 56

The above persons were employed in installing equipment and getting mill ready to operate. They had no fixed hours, but worked eight or more hours daily.

Owing to the fact that the mill was not in actual operation up to June 30, 1919, there were no receipts to be credited to this fund at that time, and no wages were paid prisoners.

The additional land which the act of July 10, 1918, authorizes and directs the Attorney General to acquire and cultivate, has not been acquired up to the close of the fiscal year, therefore no detailed report can be made on its operation, as is required by section 6 of the act.

(B) PENITENTIARY AT LEAVENWORTH, KANS.

The average population during the fiscal year 1919 was 1,895; in 1918 it was 1,613. There were 7 deaths during the year, 11 less than during the previous year. Five of the deaths were from pneumonia, complicating la grippe. The average yearly cost of maintenance per man was \$336.65. In 1918 it was \$299.63. The daily cost per man was \$0.9223; in 1918 it was \$0.8209. The total cost of maintenance during 1919 was \$638,041.09. The increased cost was due entirely to advanced cost of many supplies.

During the year the prisoners were employed in the construction of new prison buildings, the cultivation of the prison farm, and the usual prison duties. The construction of the west main cell wing was carried along to a point well toward completion. The estimate in the Attorney General's Annual Report for 1917 that this wing would be ready for occupancy by the winter of 1918 has not been realized for several reasons. The increased price and difficulty in

getting building material have been considerable factors in the delay. In March, 1919, a fire, probably of incendiary origin, destroyed a building containing the blacksmith shop and the stone sawmill, which served to delay the construction.

The value of the farm products for the year was \$41,184.76, exclusive of \$7,341.50 feed raised and fed to stock, and the cost of the farm, exclusive of the farmer's salary, was \$15,996.11, which includes \$1,848.50 expended in purchase and repair of a passenger automobile for use of the warden, making a net profit of \$25,188.65, as compared with a net profit of \$29,481.34 for the preceding year.

(C) PENITENTIARY AT MCNEIL ISLAND, WASH.

The average daily population during the year 1919 was 268; in 1918 it was 239. There were 2 deaths during the year, 2 less than last. The average yearly cost of maintenance per man, exclusive of subsistence furnished officers and guards, was \$316.98; in 1918 it was \$289.77. The daily cost per man was \$0.8684; in 1918 it was \$0.793. The total cost of maintenance during 1919 was \$88,437.70. The prison farm produced supplies of the value of \$20,472.89, at a cost of \$6,668.04, making a net profit of \$13,804.85, as compared with a net profit of \$9,667.27 for the preceding year.

During the year the prisoners were employed in excavating and filling, construction of new prison buildings, farming, and the usual prison duties.

(D) NATIONAL TRAINING SCHOOL FOR BOYS.

The report of the board of trustees shows that there were confined in the school on June 30, 1919, 412 juvenile offenders, as compared with 389 on June 30, 1918. There were received during the year 311 juvenile offenders; during 1918, 222. Of those received during 1918, 3 were committed by the Supreme Court of the District of Columbia; 133 by the juvenile court of the District of Columbia; 143 by the United States courts, and 23 paroled boys and 9 escaped boys were returned.

The board urges legislation to secure commitments from the United States courts on the same basis as commitments from the courts of the District of Columbia, namely, commitments during minority instead of for a definite number of years.

(E) NATIONAL TRAINING SCHOOL FOR GIRLS.

The report of the board of trustees shows that there were confined in the school on June 30, 1919, 101 girls; on June 30, 1918, there were 83. During the year there were 50 commitments; 10 returned for violation of parole; 32 were released on parole.

The board recommends the acquisition of 100 acres of unimproved land lying south of the present school grounds and they ask an appropriation of \$100,000 for this purpose.

(F) BUREAU OF CRIMINAL IDENTIFICATION.

During the year ended June 30, 1919, 59,289 criminal records were received, of which 50,752 were finger-print records and 8,537 anthropometric or Bertillon records. During 1918, 56,472 were received. There were on file at the close of the year 1919, 262,712 finger-print records, 71,004 Bertillon records, and 365,295 index record cards. During the year 14,987 identifications were made, of which 13,830 were by the finger-print system, 1,040 by the Bertillon system, and 117 from the index cards. Among the number identified were 182 parole violators and 171 escapes. In addition the bureau was the means of apprehending numerous other fugitives from justice. The bureau sent out 47,656 pieces of criminal information, as compared to 42,870 sent out during the preceding year.

During the year the bureau added to its list of contributors 2 penal institutions, 16 police departments, 39 sheriffs, and others, giving the bureau a total of 494 contributors. In addition to its business with these authorized cooperators, the bureau has handled hundreds of special cases from all parts of the country, as well as from England, Canada, and Australia.

This bureau is now generally recognized by penal institutions, Government departments and bureaus, police departments, sheriffs, and other peace officers as the national clearing house for criminal identification records and information.

PAROLES.

During the year 488 prisoners were released on parole, as compared with 257 during the year 1918. Of this number 332 were released from the Federal penitentiaries, as compared with 210 during the previous year. The paroles of 15 prisoners were terminated for violation of the conditions of their parole, as compared with 21 in the prior fiscal year.

Paroled prisoners earned for themselves during the year \$307,947.10 in money, besides in many instances receiving board and lodging. These figures do not include the value of crops, etc., produced by those who were engaged in farming for themselves.

The administration of the parole law during the year has cost the Government \$10,950.41, as compared with \$11,725.32 for the preceding year. This includes salaries, traveling expenses, stationery and printing, etc.

SUMMARY OF BUSINESS, REVENUES, AND EXPENDITURES, DEPARTMENT OF JUSTICE AND COURTS OF THE UNITED STATES.

(Detailed information will be found in accompanying exhibits and Treasury reports.)

1. BUSINESS.

(A) SUPREME COURT OF THE UNITED STATES.

Number of cases and other proceedings docketed during the year.....	582
Number of cases and other proceedings disposed of during the year.....	669
Number of cases and other proceedings pending at the close of the year.....	408

(B) UNITED STATES COURT OF CUSTOMS APPEALS.

Number of cases and other proceedings docketed during the year.....	72
Number of cases and other proceedings disposed of during the year.....	63
Number of cases and other proceedings pending at the close of the year.....	35

(C) COURT OF CLAIMS.

Number of cases and other proceedings docketed during the year.....	156
Number of cases and other proceedings disposed of during the year.....	896

Grand total.....	16,219,340.02

The exhibits accompanying this report follow immediately.

A. MITCHELL PALMER,
Attorney General.

REPORT OF THE POSTMASTER GENERAL.

NOVEMBER 7, 1919.

TO THE PRESIDENT:

The Postmaster General has the honor to present his report for the fiscal year ended June 30, 1919.

POSTAL FINANCES.

The revenues of the Postal Service for the fiscal year ended June 30, 1919, as reported by the Auditor for the Post Office Department, including the revenues from money-order and postal savings business and the increase in postage derived from the 3-cent rate on letter mail and the 2-cent rate on postal cards and post cards, amounted to \$436,239,126.20.

The act of Congress increasing the postage rates became effective on November 2, 1917, and expired by limitation on June 30, 1919. The increase in the rates was virtually a war tax, and has been so treated in compiling postal statistics for comparative purposes. The collections under the act during the period in which it was in force, which necessarily were estimated, amounted to \$115,892,000, and were turned over to the Treasury of the United States monthly as they accrued in the manner prescribed by the act. The estimated collections during the period from November 2, 1917, to June 30, 1918, amounted to \$44,500,000, and during the period from July 1, 1918, to June 30, 1919, to \$71,392,000.

The ordinary postal revenues for the fiscal year 1919, therefore, after deducting the estimated collections for increase in postage, amounted to \$364,847,126.20. For comparative purposes this sum represents the normal revenues of the Postal Service and shows an increase over the preceding year of \$20,371,163.96, or 5.91 per cent.

The audited expenditures for the year were \$362,497,635.69, an increase over the preceding year of \$37,663,907.22, or 11.59 per cent.

The audited revenues therefore exceeded the audited expenditures by \$2,349,490.51. After deducting losses of postal funds by fire, burglary, and other causes, amounting to \$6,638.55, the accounts as closed for the year show a surplus of \$2,342,851.96.

This surplus is subject to adjustment, however, as it is based on actual cash payments made during the fiscal year 1919 and includes payments for services performed and supplies purchased in preceding years which could not be paid in the years in which the obligations were incurred. The payments on account of prior years should be eliminated in the adjustment, and on the other hand obligations of like character incurred in 1919 and paid in subsequent years should be taken into account.

Firm in the belief that the postal establishment should be self-supporting, it has been the policy and constant aim of this administration, during the seven years of its tenure of office, to equalize postal revenues and expenditures in so far as it is possible to do so, in order that postal operations might be removed from consideration in connection with the levying of taxes. This, it is submitted, is sound public policy. To administer the affairs of the service without regard to economy and efficiency, passively submissive to the grip of selfish private interests which fatten on extravagance, privilege, and favoritism, is not only a breach of public trust, but inevitably results in an unwarranted burden on the public treasury. On the other hand to conduct the service with an eye single to profit is to impose a supplemental tax and thereby assume a function not contemplated or delegated by law. The service belongs to the people and should be conducted for their use and benefit, but those who use the mails for particular purposes should pay for the service rendered them at rates approximating the cost of the service. There should be no class distinction of any kind. The attempt to equalize the revenues and expenditures can only produce approximate results, however, for the revenues depend upon the patronage of the public, and the necessity of making many long-term contracts for the carrying of the mails precludes the possibility of adjusting expenditures concurrently with periods in which the revenues are relatively low.

In keeping with these principles the controlling purpose of this administration has been to promote efficiency by the complete standardization of the service—by harmonizing equipment, adjusting the personnel in respect to individual fitness and ability, and securing the greatest possible cooperation in every quarter. If these efforts brought the expenditures below the revenues, the surplus was to be used for the enlargement of the service, and, when justified, to a reduction of rates. Where it has been necessary to enlarge postal facilities money has been spent without stint; where extravagance or waste were apparent the pruning knife has been applied without fear or favor. That the carrying out of these principles has been efficacious is demonstrated by the table which follows showing the financial results of postal administration during the two successive seven year periods from July 1, 1905, to June 30, 1919, being the

fiscal years 1906 to 1919, inclusive. The figures have been taken from the official reports of the Auditor for the Post Office Department, and while the first fiscal year reported in the second period was partly in the tenure of office of the previous administration it appears that the revenues and expenditures for the first half of that year were approximately equal and therefore negligible for comparative purposes.

Period.	Revenues.	Expenditures.	Losses.	Surplus (+) or deficit (-)
Period from July 1, 1905, to June 30, 1912, being the fiscal years 1906 to 1912, inclusive:				
1906.....	\$167,932,782.95	\$178,449,778.89	\$25,945.82	—\$10,542,941.76

Increase over previous 7-year period....	737,597,818.12	643,335,795.08	234.42	
Per cent of increase.....	50.68	42.49	.12	

It will be observed that in the first period, covering the seven years prior to the time the present administration assumed office, there was an unbroken line of annual deficits, excepting in 1911, when a small surplus was shown, the aggregate net deficit for the period amounting to \$59,072,909.62. On the other hand, in the second period, covering practically the tenure of office of the present administration, there has been an unbroken line of annual surpluses, excepting in 1915, the year in which the great World War began, the aggregate net surplus for the period amounting to \$35,188,879. The net change in favor of the Public Treasury was, therefore, \$94,261,788.62. The cause of the change is immediately apparent. Whereas the revenues under this administration increased \$737,597,818.12, or at the rate of 50.68 per cent, compared with the seven-year period prior to the time it assumed office, the expenditures increased only

\$643,335,795.08, or at the rate of 42.49 per cent. The difference between the increase in expenditures and the increase in revenues, less losses, equals the amount of the net change in favor of the Public Treasury.

Each branch of the service participated substantially in the increased expenditures for this period, particularly the branches composed wholly or largely of salaried employees, as the following table will show:

Branch.	Amount of increase.	Per cent of increase.
Post Office Service:		
Salaries of postmasters.....	\$32,920,358.80	17.82
Salaries of clerks, etc.....	166,463,189.07	69.93
City Delivery Service.....	99,274,541.28	49.39
Other expenditures.....	43,411,661.80	63.27
Railway Mail Service.....	71,828,129.78	57.32
Rural Delivery Service.....	129,930,820.72	54.68
Transportation of domestic mail:		
By railroads.....	57,322,425.06	16.53
By other means of transportation.....	40,120,954.73	46.22
Transportation of foreign mail.....	3,180,278.77	14.10
Payment of invalid money orders.....	¹ 1,116,564.93	¹ 39.64
Total.....	643,335,795.08	42.49

¹Decrease.

It is believed that much of the criticism that has been directed at the financial policy of this administration was due to lack of complete and accurate information as to the facts. Criticism from the interests adversely affected was to have been expected. The facts as above presented tell a story of achievement. They do not call for explanations or apologies and none are given. The administration stands squarely on its record.

IMPROVEMENTS AND EXTENSIONS IN THE POSTAL SERVICE.

Since 1913 many additional postal facilities have been provided for the public.

Nothing has been left undone that was within the authority of the Postmaster General to do to effect readjustments in the interest of all the people and not in that of any special class.

Because of the curtailment of what may be termed "special class" postal facilities there has grown up strenuous hostility upon the part of a limited number of "special interests," the expense of whose private business was largely paid by the Government instead of by themselves. This has particular reference to the modifying of the second-class mailing privilege which had until the advent of the present administration been grossly abused.

The more important improvements may be epitomized as follows: Inauguration of the air-mail service; establishment of the "space system" in determining the compensation of railroads for carrying the mail; readjustment of railway mail service in the interest of both improvement and economy; readjustments of organizations in post offices, methods of service, and distribution of supplies, on a basis of sound business principle; inauguration of rural and city motor vehicle service and village delivery service; extension of box and collection service and postage-stamp, money-order and registry facilities to patrons on star routes; improvements in the registry system, insured parcel post, and methods of handling dead letters; readjustment of rural delivery service, providing more equitable distribution of facilities to patrons already served and extensions of facilities to those citizens who had theretofore been denied any service at all; complete reorganization of the equipment and supply services through the extension of operation and economy of production, and the introduction of modern shop methods, equipment and appliances, effecting substantial savings and improvement in the service; the partial adjustment of the postage rates on second-class mail matter, effecting a saving of over \$15,000,000 annually; reduction of letter postage between the United States and several foreign countries; large extension of international parcel post, and the increase in weight and size of parcels permitted in the mails.

The act creating the parcel post went into effect on January 1, 1913, and while that law contained many provisions that should at the time have been modified in the interest of the public, the Congress in its wisdom vested the Postmaster General with authority to make from time to time such changes as might be found necessary to the proper extension and betterment of the service. The Postmaster General has taken advantage of that authority and thereunder effected many reforms and improvements. The increase in the volume of business growing out of this service is indicated by the fact that the number of parcels mailed in 1913 was 331,394,800, and in 1919 the number mailed was more than 2,250,000,000. The extent of usefulness of the service to and popularity with the public is reflected in the last estimate of the profits in handling parcel post, which was made in 1916, when the figures compiled indicated a profit in round numbers of \$10,000,000. War activities taken over by the Postal Service in addition to its regular functions have prevented further compilation of current statistics on this subject.

On May 18, 1916, the Congress, upon the urgent recommendation of the Postmaster General, amended the original postal savings law by removing altogether the monthly limit on deposits of \$100 and increased the amount that a depositor may have to his credit from \$500 to \$1,000. On July 2, 1919, the Congress, also upon the

recommendation of the Postmaster General, again amended the postal savings act by further increasing the amount that a depositor may have to his credit from \$1,000 to \$2,500. A number of important changes in the postal savings system have been inaugurated which have broadened its scope of usefulness and greatly benefited the public.

The Postmaster General in his report for 1913 recommended legislation looking to the compensation of injured postal employees and this led up finally to the enactment on September 7, 1916, of the present law, which is proving of great benefit to all Government employees injured while in the service of the Government.

Salaries of employees in all grades have been increased, working conditions and hours of labor improved, and everything possible done for the health and comfort of the employees.

In order that the spirit and letter of civil service might be conscientiously carried out as far as practicable, and pending enactment by the Congress of legislation which, though repeatedly urged by the Postmaster General, failed of passage, several Executive orders have been issued by the President extending in effect the classified civil service to postmasterships of all classes and requiring that those who were blanketed into civil service by Executive orders under previous administrations without having been subjected to any civil-service or merit test whatever shall be required to pass a civil-service examination. This is believed to be a long step in the direction of higher standards in the Government service and a more businesslike administration of postal affairs.

INCREASED VOLUME OF MAIL.

As stated in the last annual report, the volume of mail handled during the fiscal year ended June 30, 1918, exceeded that of any other like period in the history of the department, and this condition has not been materially changed during the present fiscal year, for the reason that all of the executive departments and independent establishments of the Government which expanded their operations on account of the war, as well as a number of war activities, have continued them since, and their use of the mail service has added a greatly increased volume of work upon this department.

The exigencies of war imperatively demanded that scrupulous care be exercised by every branch of the Government service in conserving revenues, hence it was not possible to extend postal facilities as would have been done in normal times; but with the restoration of business from a war to a peace basis the country is experiencing an era of the greatest industrial development and prosperity in its history, which naturally is reflected in the Postal Service and indicates that there has not been, by reason of the signing of the armis-

tice, any considerable curtailment in the responsibilities and demands imposed upon it. In the circumstances, the public interest requires that the Postal Service be substantially extended and built up to meet the rapid growth of the country and the needs of business.

WAR ACTIVITIES.

The department continued during the year its assistance and co-operation to other branches of the Government, utilizing the extensive organization and personnel of the Postal Service in the execution of the numerous details of the Government's war program and war activities. Aside from the extensive use of the mails in the regular manner, practically every department of the Government has sought the facilities of the postal establishment in putting its war plans and work before the people of the country. This material assistance has been afforded in every instance where it could be done without curtailing or abridging the Postal Service. Some of the most unusual, highly important, and extraordinary activities not connected with the mail service were placed upon the postal establishment. They may be briefly stated, as follows:

The establishment and maintenance of mail service for the military forces in the United States and abroad.

The operation of the telegraph and telephone systems.

The transportation and delivery of tens of thousands of tons of mail for the various war agencies.

The administration of the provisions of the espionage and trading with the enemy acts, the purposes of which were to prevent the use of the mails in disseminating matter calculated to incite disloyalty and sedition against the United States Government during the war.

The registration of enemy aliens and the listing of enemy-owned property by postmasters.

The reporting of disloyal utterances.

The use of post-office inspectors in furnishing information to the intelligence service of the Army and Navy and to the Departments of State and Justice.

The distribution of over 20,000,000 questionnaires of the first and second selective drafts. The successful conduct of the war rendered it imperatively necessary that these questionnaires be quickly dispatched. Each questionnaire had to be handled five different times. This imposed upon the postal establishment a tremendous volume of mail and a grave responsibility for the quick and efficient distribution thereof. It was accomplished to the entire satisfaction of the War Department.

The use of post offices as recruiting agencies for the Army, Navy, and Marine Corps, and as employment agencies for the Department of Labor.

The issuing of export licenses and furnishing income-tax information at post offices.

The use of post-office lobbies for posting public bulletins as to various war measures and activities.

The use of the postal organization in connection with the Nation-wide fuel and food conservation campaigns, also in connection with the sale of Liberty and Victory bonds, War Savings, Thrift, and revenue stamps, and practically every other activity and patriotic endeavor intended to aid in successfully prosecuting the war.

Postmasters and postal employees generally have responded cheerfully to these numerous demands upon and extraneous duties required of them, evidencing at all times a noteworthy spirit of loyalty and patriotism. The Postal Service as a whole is credited with 83 per cent of the total amount of sales of War Savings stamps. One letter carrier sold and personally delivered \$160,000 worth of War Savings stamps, and there were many similar cases of noteworthy and commendable individual effort in every branch of the Postal Service. Furthermore, the personnel of the service subscribed to their limit to the various Government loans, as well as contributing liberally to the funds to carry on the social and welfare work in the armies and camps.

MILITARY MAIL.

Immediately upon the mobilization of troops the Post Office Department undertook the installation and operation of a military branch post office at each of the camps, cantonments, aviation fields, and naval training stations established by the War and Navy Departments, with a view to supplying the postal needs of our soldiers, sailors, and marines. During the progress of the war, 151 of these military branch post offices, fully equipped with every modern facility for the transaction of all branches of postal business, were inaugurated and manned with experienced clerks drawn from large post offices throughout the country, who volunteered for this work through patriotic motives for the sole purpose of rendering a service second only to that performed by the soldiers in the trenches. Because of this voluntary service on the part of postal employees, the department was able to render to the soldiers in the camps of this country a postal service equal in all respects to that received through their home offices. More than 1,200 willing and efficient clerks were thus obtained who endured the hardships and inconveniences of camp life in all portions of the country so long as their services were required, many of them continuing on duty to the present time.

The buildings used for post-office purposes at the various camps were provided by the War Department, as were also barracks for the sleeping accommodations of the post-office employees. Despite

the fact that these buildings were not of sufficient capacity to properly house the clerks or accommodate the large volume of mail handled, the service was satisfactory both to the department and to the military personnel and brought forth hearty praise from parents, relatives and friends.

It was early realized that to effect delivery of mail to soldiers who had moved from one camp to another, or from unit to unit within a camp, means must be provided whereby each change of designation or location could be recorded and mail properly forwarded to the new address. This difficulty was overcome through the installation of an elaborate card-filing system which, with the cooperation of the military authorities, was kept current at all times. Letters and packages that could not be delivered at the camp of address were immediately forwarded to other camps or to overseas addresses. Frequent changes in assignments and transfers from point to point, in some cases amounting to 40,000 at a single camp within a month, added greatly to the labors in the branch post office and the fact that mail for the transferred soldiers was promptly forwarded and delivered at the new addresses demonstrates the efficiency of the system. Many cases have been reported to the Department where mail followed soldiers from the camp of mobilization to the camp of embarkation and was delivered to the addressees before they embarked for the other side. Much trouble was experienced, however, through the carelessness of mailers in giving incorrect and insufficient addresses. The duplication of names in a camp of 60,000 or more troops as well as the duplication of company letters and regimental numbers precluded the possibility in many cases of effecting delivery. It was to this class of mail, more particularly, complaints were directed and in each instance where investigation was made the failure to deliver was found to be due to the carelessness or neglect on the part of the sender and not to inefficiency on the part of post-office employees.

Since the signing of the armistice and the beginning of the return of our soldiers from France, large quantities of letter mail have been returned to this country from overseas where it failed of delivery and was sent to the various camps in this country designated by the War Department as demobilization centers. Unfortunately, because of the delay in returning this mail, it reached the demobilization camps after the soldiers had been discharged and it was found necessary to return the mail to the senders. Failure to deliver in such instances was through no fault of the Post Office Department but to the failure of the military authorities in France, under whose jurisdiction the handling of the mail for soldiers overseas was

placed on July 1, 1918, to effect delivery or to return promptly mail intended for returned soldiers.

The magnitude of the business transacted at the various military branch post offices, as indicated by the financial returns on file in the department, shows that during the period of mobilization the postal receipts from the various branch post offices amounted to as much as \$1,000,000 a month, an amount in excess of the receipts of the third largest post office in the United States. Approximately 90,000 money orders were issued monthly, amounting in the aggregate to nearly \$2,000,000, with a proportionate amount of registered, C. O. D. and insured business.

Since the demobilization of troops, from November, 1918, the number of military branch post offices has decreased until at the present time but 77 are in operation.

FOREIGN MAIL SERVICE.

Fostering of the export trade of the United States through the improvement and extension of the foreign mail service has been one of the dominant features of the postal service under this administration.

The reduction in letter postage between the United States and certain countries of the Western Hemisphere, enlargement of the foreign parcel post service, and the general expedition and improvement of the mail service between the United States and foreign countries, particularly to those of Central and South America, since 1913, offers marked inducement to the development of our foreign trade.

From 1913 to 1919 the international parcel post service was extended from 47 to 85 countries or colonies. Agreements were effected during this period with 13 countries or colonies increasing the weight limit on parcels from 11 pounds to 20 or 22 pounds. The dispatch of parcel post matter to foreign countries increased from 2,831,512 pounds in 1913 to 17,102,131 pounds in 1919.

Special postal conventions with 11 countries of the Western Hemisphere have been effected since 1915 providing for a reciprocal domestic letter rate on letters exchanged between the United States and those countries or colonies.

The British colony of the Windward Islands has entered into an agreement with the United States for the application of the domestic rate of the country of origin to letters addressed for delivery in the other country, and it is hoped, now that the war is over, that the remaining countries and colonies of the Western Hemisphere will assent to the department's proposals for reciprocal domestic rates of postage.

The mail services suspended on account of the war were restored as promptly as circumstances permitted, and at the end of the year

mail service was in operation to all countries except to Hungary and the parts of Russia under Bolshevik control.

Every encouragement has been given to fast steamship lines carrying mails, and the service to Central and South American ports, and to Europe, has been expedited.

The cost, from 1892 to June 30, 1912, of carrying the mails by contract ships, authorized under the ocean mail act of 1891, was \$8,000,000 more than if carried at the pound rate charge of non-contract ships. Through intelligent management the cost of the contract service for the six fiscal years ending June 30, 1919, was reduced to \$2,566,694.35 less than it would have cost if the mails had been carried by noncontract vessels.

Upon the opening of the Panama Canal arrangement was made so that the mails dispatched from the United States for the west coasts of Central and South America instead of being transported across the Isthmus by railway were as far as possible transshipped from steamer to steamer at Colon, thereby very greatly reducing the expense to the department on account of transportation across the Isthmus. The cost of transporting the mails across the Isthmus during the fiscal year ended June 30, 1913, was \$149,732.92 and for the fiscal year ended June 30, 1919, it was \$12,773.94.

INTERNATIONAL PARCEL POST.

During the last fiscal year parcel post conventions were concluded with Chile, Paraguay, Roumania, Siam, and the Union of South Africa; and by virtue of arrangements made under conventions heretofore concluded parcel post service was extended to Algeria, British India, Corsica, Egypt, French India, Iceland, Luxembourg, Madeira Islands, Mesopotamia, Palestine, and Tunis. The parcel post service for Belgium, Denmark, Germany, Greece, Liberia, the Netherlands, Norway, and Sweden, which was suspended during the war, was resumed. Arrangements were made for the increase in the maximum weight from 11 to 22 pounds of parcel post packages for Brazil, British Honduras, Colombia, Guatemala, Republic of Honduras, Nicaragua, and Peru, and to 20 pounds for Argentine Republic. Negotiations are being continued with the view of extending the service to all places to which it is not in operation, a convention having been concluded with Spain since the end of the year providing for service to Spain and her possessions (the Belearic Islands, the Canary Islands, and the Spanish possessions in North Africa).

Notwithstanding the interruptions to the international parcel post service due to the war, the weight of the parcel post mails dispatched during the year was 17,102,131 pounds, or an increase of 23.57 per cent over the previous year; of which 7,218,186 pounds represent the weight of the parcel mails dispatched to Mexico, Central and South

America, an increase of 1,112,234 pounds, or 18.22 per cent over the parcel mails dispatched to said countries during the preceding year.

OCEAN MAIL SERVICE.

The conditions affecting mail-carrying steamers mentioned in the report for last year were similar during this year. The contract steamers on the New York-Liverpool route were not returned to the department by the military and naval authorities, but fairly satisfactory service was maintained through continued cooperation with the War and Navy Departments, the War Trade Board, and the Shipping Board.

The cost of the contract service on route No. 80, San Francisco-Sydney, was \$177,058.84 less than the conveyance of the mails concerned would have cost if the steamers had been paid at the rates applicable to noncontract steamers; and for the first time the cost of the contract service on route No. 36, New York to La Guaira, Venezuela, and on route No. 37, New York to Maracaibo, Venezuela, was less than the service would have cost by noncontract steamers—on the former route \$25,086.51 and on the latter \$28,739.12 less.

The arrangement which became effective November 1, 1916, whereby all mails dispatched from the United States for the west coast of South America via the Isthmus of Panama are consigned to the director of posts of the Canal Zone, who supervises their onward dispatch, continued to operate with gratifying results, and further reduced the cost of the Isthmus transit of United States mails, the cost for the fiscal year 1919 being \$12,773.94, or \$4,609.12 less than the cost for the fiscal year 1918, and \$94,820.51 less than the year 1916.

MILITARY MAIL SERVICE ABROAD AND POSTAL CENSORSHIP.

Upon the signing of the armistice in November, 1918, the department promptly began to bring about readjustments to a peace basis. Curtailments of the service in connection with the American Expeditionary Forces in France were immediately begun and continued as rapidly as possible. At the end of July, of the 352 postal employees who had been engaged in the service in France only 92 remained. In Siberia the service has been continued without material change. The postal censorship mentioned in the last report of the Postmaster General was rapidly diminished and was entirely discontinued before the end of the year. Of the amount (\$1,620,000) appropriated for the censorship service \$285,538 was returned to the Treasury as unexpended balance.

AIR MAIL SERVICE.

The present Postal Administration was prompt to seize upon the great possibility of expediting the mails offered by the invention

of the aeroplane, and repeatedly the Postmaster General has urged appropriations for an experimental air mail service.

The development of the aeroplane in warfare inspired the belief that it could be made to serve the uses of peaceful transportation, and with this in view the Post Office Department was successful in securing an appropriation by Congress of \$100,000 for the fiscal year ending June 30, 1918, for an experimental air mail route. On May 15, 1918, the present successful New York-Washington route on a regular schedule was inaugurated. The service operates in about one-half the time required by train between the two cities and is performed with a regularity and a certainty which up to this time has not been equaled anywhere in the world.

During the fiscal year ending June 30, 1919, the appropriation of \$100,000 was repeated. So successful was the service that for the fiscal year ending June 30, 1920, Congress appropriated \$850,500, which has enabled the extension of the Air Mail Service to Cleveland and Chicago, with a saving in time of 11 hours in transit over the fastest passenger-train service between New York and Chicago and an expedition by 16 hours in the actual delivery of the letters.

The slowing down by the railroads of the running time of important mail and passenger trains has emphasized the importance of extending the Air Mail Service. How these roads have slowed down certain important mail trains since 1913 and the time in which mail can be delivered by aeroplane is shown in the following table:

Scheduled time of mail trains in 1913 and 1919.

The success obtained in the operation of the Air Mail Service during the fiscal year ending June 30, 1918, led to an important extension of the service from New York to Chicago. This route is operated in two sections, (a) New York to Cleveland, and (b) Cleveland to Chicago, and results in the expedition of the delivery of letters from New York by 16 hours to the Middle West and 24 hours to the principal Pacific Coast cities.

NEW YORK-CLEVELAND ROUTE.

The air distance from New York to Cleveland is 410 miles and the time of transit is from $4\frac{1}{2}$ to 5 hours. The rail distance is 620 miles and the time of transit from 13 hours and 5 minutes to 17 hours and 20 minutes. On this leg of the journey letters at the rate of 5,000,000 a year are carried westbound, and at Cleveland the Chicago Gateway mail is placed on New York Central train No. 35, resulting in expedition of the mail to the Middle West States by 16 hours and to the Pacific Coast by 24 hours. Eastbound the plane bound from Cleveland to New York takes approximately 14,000 letters daily from the train that left Chicago at 11 p. m. the night before and delivers these letters in New York in time for the afternoon carrier trips, thereby effecting a saving of 16 hours in delivery in New York city. Had these letters continued on their train they would not have reached New York until the following morning.

CLEVELAND-CHICAGO ROUTE.

The air-line distance between Cleveland and Chicago is 325 miles and the time of transit is about $3\frac{1}{2}$ hours. The distance by rail is 340 miles and the time of transit 6 hours and 55 minutes to 10 hours and 30 minutes. On the leg from Cleveland to Chicago westbound letters at the rate of approximately 5,000,000 a year are taken from train No. 19, which left New York at 5.31 o'clock in the afternoon before, and are deposited in the post office at Chicago usually about 1 o'clock in the afternoon in time for all city carriers. This effects a saving of 16 hours in the delivery of the letters in Chicago, as train No. 19 would not reach that city in time to make delivery until the following morning. Eastbound from Chicago approximately 5,000,000 letters a year are carried to Cleveland, where the Twentieth Century train is overtaken, resulting in the mail being delivered in New York City at 9.40 the following morning, the gain in delivery of the mail in New York City and the New England States being 16 hours.

NEW YORK-WASHINGTON ROUTE.

The air distance on the New York-Washington route is 218 miles and the time of transit $2\frac{1}{2}$ to 3 hours. The rail distances is 226 miles and the time of transit 5 hours to 6 hours and 20 minutes. On this

route mail originating in New York City late at night and in the New England States up to 10 o'clock at night is delivered by planes in the city of Washington in ample time for all carrier deliveries that afternoon. The immediate result of this service has been the elimination of the constant complaints that it took two days for the night mail from Boston to be delivered in the city of Washington. These delays were beyond the control of the Post Office Department, having been due to uncertain train connections and to the transfer of the mail across New York City from one railroad station to another. Northbound the mail is taken from Southern train connections at Washington and delivered in New York in time for the afternoon carriers. If this mail had remained on the trains it would have reached New York City too late for carrier delivery on that day.

MAGNITUDE OF DAILY OPERATIONS.

On the three routes as now established, shown by chart which follows, there are in the air daily eight aeroplanes each with a capacity of from 14,000 to 16,000 letters. These eight planes fly an aggregate of 1,906 miles each day carrying at the rate of more than 30,000,000 letters per year. On each of the three routes the mail is advanced 16 hours in each direction and in the case of mail destined for the Pacific coast the advance in delivery is 24 hours.

The cost of operation of the Air Mail Service during the fiscal year ending June 30, 1919, was \$166,402.52, and the revenue from the sale of special rate aeroplane stamps was \$194,831.50. The cost of operation includes depreciation at the rate of $33\frac{1}{3}$ per cent, which the operations of the service so far indicates to be ample, and an interest-on-investment charge of 6 per cent.

AIR MAIL'S CONTRIBUTION TO AVIATION.

The principal mechanical development during the year was the salvaging of a large number of Army war planes rendered surplus to the Army on the conclusion of the war. Another development was the creation by American aeronautical engineers and the air mail staff of the Post Office Department of distinctive mail carrying planes with from three-fourths of a ton to 2 tons letter capacity. With these planes in operation during the fiscal year ending June 30, 1920, the department, by reason of the quantity of mail carried and the speed of the plane, will save in car distribution space twice the amount of the cost of the Air Mail Service. Still another important development was the creation by the Bureau of Standards, at the request of the Post Office Department, of a radio signal device that will guide an aviator in any kind of weather direct to the center of his landing field.

In other respects the daily operation of the Air Mail Service has contributed signally to the advancement of aviation, notably in the perfection of aeroplane compasses, radio direction-finding devices and spark plugs for powerful high-compression motors.

WORLD'S ONLY SUCCESSFUL AERIAL SERVICE.

The Air Mail Service of the United States is the only practical commercial aeroplane service in the world. No service in foreign countries compares with it in magnitude, in continuous dependability and in benefits to commerce. Its record of performance during the fiscal year of 1919 was 96.54 per cent, and this record was obtained with more than 30 per cent of the trips made in rain, fog, mists or other conditons of poor visibility. The operation of the service by months for the fiscal year ending June 30, 1919, is given in the accompanying table.

During the fiscal year just closed there has been one fatal accident to a pilot carrying the mail. This was on May 25, 1919, at Cleveland, Ohio, when the pilot fell from his machine which had caught fire and after he had successfully piloted it down to a good field to within 200 feet of the ground. In addition to this fatality a mechanic was fatally injured by being struck by a whirling propeller of an aeroplane on the ground, and an applicant for a position of mail pilot was killed in the fall of his plane while attempting to demonstrate his fitness as a pilot in the service. During the year there was but one serious case of injury, the pilot, however, returning to duty after several weeks in the hospital; while not above 8 or 10 minor injuries, such as bruises, were reported in cases where aviators had made forced landings on poor fields. This record for daily operation in all kinds of weather and for long distances across country has been accepted as demonstrating the real absence of danger in straight commercial flying as compared with the more hazardous performance in exhibition or military flights. It has resulted in the assumption of insurance risks for airplane accidents and casualties by certain insurance companies of the country.

REDUCTION IN RATES OF AIR MAIL POSTAGE.

With the creation of the large weight-carrying planes for the mail service, consideration was given to a reduction of the air-mail postage rate to the regular rate for all first-class mail matter, namely, 2 cents per ounce or fraction thereof, as with the large planes the saving in car distribution space on the railroads will more than pay the cost of the air-mail service. This economy in letter transportation for long distances by aeroplanes over the cost of distributing the mail on the trains is made possible by the fast transit by air which enables the distribution of letters in the post offices instead of on the trains.

Consolidated statement of operations of air mail service, July 1, 1918, to July 1, 1919.

SECOND-CLASS MATTER.

The weight of newspapers and periodicals mailed as second-class matter by publishers and news agents during the year at the pound rates of postage and free in the county of publication aggregated 1,182,297,966 pounds. This was a decrease of 47,411,389 pounds, or 3.86 per cent, as compared with the mailings of the preceding year. The postage collected on such mailings amounted to

\$16,065,947.76, an increase over the previous year of \$4,353,879.58, the increase being due to the higher postage rates which became effective July 1, 1918, under the provisions of the act of October 3, 1917.

These rates constituted the first of a series of graduated annual increases beginning July 1 each year and reaching the maximum on July 1, 1921. The rates in force from July 1, 1918, to July 1, 1919, were as follows: On the portions of publications devoted to matter other than advertising $1\frac{1}{4}$ cents a pound; on the advertising portions, first and second zones, $1\frac{1}{4}$ cents a pound; third zone $1\frac{1}{2}$ cents a pound, fourth zone, 2 cents a pound; fifth zone, $2\frac{1}{4}$ cents a pound; sixth zone, $2\frac{1}{2}$ cents a pound; seventh zone, 3 cents a pound; eighth zone, $3\frac{1}{4}$ cents a pound. Where the space in a publication devoted to advertisements did not exceed five per cent of the total space the entire publication was chargeable only with the flat rate for matter other than advertising, the zone rates not applying. Publications maintained by and in the interest of religious, educational, scientific, philanthropic, agricultural, labor or fraternal organizations not conducted for private profit enjoyed the special rate of $1\frac{1}{8}$ cents a pound, this rate applying to both the reading and advertising portions of such publications.

The weight of the advertising portions of publications which were chargeable with the zone rates aggregated 452,476,476 pounds, and the postage on such portions amounted to \$7,839,302.79. On the remainder of the mailings subject to postage, consisting of the non-advertising portions of publications whose advertising portions were subject to the zone rates, and of the entire portions of publications chargeable with the flat rate, \$8,226,644.97 postage was collected. The total postage collected at the new second-class rates was \$4,807,774.28 greater than the amount that would have been chargeable on such mailings at the former flat rate of 1 cent a pound. A table showing the weight of mailings of second-class matter, by States, will be found in the appendix to this report.

At the close of the year there were 10,391 post offices at which newspapers and periodical publications were entered as second-class matter. Fifty of these offices having the largest mailings of such matter collected 76.6 per cent of the total postage paid at the pound rates.

During the year 3,304 applications were received for the admission of publications to the second class of mail matter, or for change in title, frequency of issue or office of publication, of which 2,829 were favorably acted upon and 475 denied. During the same period 3,987 publications were discontinued, leaving 27,440 publications having a second-class status at the close of the year, a decrease of 1,158 as compared with the previous year. On June 30, 1919, the

AIR MAIL SERVICE

New York and Washington Route, established May 15, 1918 — 210 miles by air, $2\frac{1}{2}$ to 3 hours; 226.80 miles by rail, 4:57 to 6:20 hours.
 New York and Cleveland Route, established July 1, 1919 — 410 miles by air, $4\frac{1}{2}$ to 5 hours; 620.64 miles by rail, 13:05 to 17:20 hours.
 Cleveland and Chicago Route, established May 15, 1919 — 325 miles by air, $3\frac{1}{2}$ to 4 hours; 340.28 miles by rail, 6:55 to 10:30 hours.

number of outstanding news agents' permits to mail second-class matter at the pound rates was 1,984.

The question of effecting an equitable readjustment of the postage rates on second-class matter constituted for many years a most perplexing one. The nominal flat rate of one cent a pound which was in force for more than 30 years manifestly covered merely a fraction of the cost of handling and transporting such matter and the mailings of newspapers and other periodical publications of the second class increased from year to year until they formed over 60 per cent of the aggregate of all domestic revenue-producing mail, yet contributed less than 5 per cent of the postage derived from such mail.

Year after year the department called attention to the necessity for revising the second-class rates of postage. The subject was carefully investigated and considered by a commission created in 1911 under a joint resolution of Congress, of which former Justice Hughes was chairman. This commission found that the cost of handling and transporting second-class matter was several times greater than the postage received therefrom and recommended an increase in the rate on such matter. Finally the difference between the revenue from this class of mail and the admitted cost of its transportation and handling became so great, and the proof thereof so conclusive, that remedial legislation could not with justice longer be deferred. Then, too, the entrance of this country into the great World War and the consequent urgent need for additional revenue made it imperative that every possible source be utilized. Accordingly, Congress, in dealing with many other questions appealing to the patriotism and sense of fairness of the people, provided in the act of October 3, 1917, for the increased rates of postage for second-class matter now in force.

It will be noted that the long-established policy of encouraging the dissemination of information and thus increasing the knowledge and well-being of the people has been continued, the law readjusting the second-class rates providing for a maximum increase of but one-half cent a pound on the news and editorial or educational portions of publications and confining the larger increases, spread over a number of years and graduated according to zones, to the advertising or commercial portions. In view of the continuance of a clearly non-compensatory nominal flat rate for the educational portions of second-class matter and the fact that the zone rates on the commercial or advertising portions even when they reach their maximum will not exceed the cost assignable to the latter portions alone, it is obvious that a considerable loss will still be entailed by the Postal Service in handling and transporting second-class matter.

The Hughes Commission found the cost of handling and transporting second-class matter in the case of mailings at the cent-a-pound rate was approximately $5\frac{1}{2}$ cents a pound, exclusive of certain

expenses, principally for services in post offices, which, because of the limited information regarding them, the commission did not assign. The department's estimate of the cost of handling and transporting this matter, including the expenses which the commission did not assign, was approximately 8.27 cents a pound. On the basis of the department's estimate at that time, which includes the unassigned expenses, the loss incident to handling and transporting second-class matter during the fiscal years 1918 and 1919, would be as follows:

	1918	1919
Pounds mailed at pound rates and free in county.....	1, 229, 709, 355	1, 182, 297, 966
Estimated expense of handling and transporting.....	\$101, 696, 963	\$97, 776, 041
Amount of postage received.....	\$11, 712, 068	\$16, 065, 947
Estimated loss in handling and transporting.....	\$89, 984, 895	\$81, 710, 094

Since the cost of transporting free-in-county matter is somewhat less than the cost of transporting matter mailed at pound rates, and also on account of economies and improvements in the service, the estimated loss as above shown may be reduced \$15,000,000 for each year, thus making the estimated loss in handling and transporting second-class matter during the fiscal year 1918 \$74,984,895, and during the fiscal year 1919 \$66,710,094.

In accordance with the law the maximum rates of postage on second-class matter will not become effective until July 1, 1921, and even then second-class mail will continue to be handled at a loss to the Government of more than \$50,000,000 annually, which must be paid either by taxation or by the users of the other classes of mail through excessive postage rates.

Some of the magazines and periodicals devote so much space to advertising that they are fast commercializing their publications and are really becoming trade journals.

It is estimated that in various issues of one publication the publishers receive for the advertising contained therein more than \$800,000, and in one particular issue it is estimated that the advertising matter at the prescribed rates would amount to more than \$1,500,000; yet the transportation and handling of a single issue of this publication costs the Government approximately \$160,000 more than the postage paid thereon.

Some publications have gone so far as to print entire catalogues of business concerns as a part of an issue, endeavoring in this way to distribute it for the industry at a much lower rate of postage than would otherwise have been paid.

It is not only unfair, but unjust to the other users of the mails that such publishers should enjoy this indefensible subsidy on a busi-

ness which yields such large returns, having the loss to the Government for the transportation and handling of their publications met through excessive postage rates on other classes of mail, or paid by drafts on the Treasury of the United States.

The Postmaster General has always believed that a low, flat rate of postage should apply to reading matter, for the reason that its primary purpose is the dissemination of news and is educational, but he is also firm in the belief that this low rate of postage should not apply to that portion of the publication devoted to advertising or commercial uses. The law which fixes a zone rate for advertising matter is eminently fair, as the rate of postage is increased in the proportion that the publication is commercialized and according to the distance it is transported; and the publisher, therefore, to a certain extent fixes for himself the rate of postage on his publication. There is no reason why advertising matter when carried in a magazine or other publication should be carried at a lower rate of postage than when sent out by the individual. Such matter should pay the Government the full cost of its transportation and handling, and for that reason, and in justice to the users of other classes of mail, the Postmaster General earnestly recommends that action be taken by Congress to increase the rate of postage on the portion of publications devoted to advertising, sufficiently to pay the cost of transporting and handling same.

CORRECTION OF ABUSES OF THE SECOND-CLASS MAIL PRIVILEGE.

A practice, which was an abuse of the second-class mail privilege, grew up among some publishers of offering with subscriptions to their publications premiums and other extraneous inducements of such value as to reduce the price of the subscriptions to such an extent as to make the rate for them merely nominal or free. Agents of some publishers solicited subscriptions at greatly reduced prices, the agents being permitted by the publishers to retain the greater part, frequently the entire amount paid by the subscriber, while in other cases they were paid a bonus in addition for each name turned in. The same procedure was followed by some publishers in connection with subscriptions solicited by agents under a combination of several publications in a so-called club offer at merely a nominal rate. These methods of obtaining subscriptions, resulting in greatly inflated circulation on which increased advertising rates were based, constituted a flagrant abuse of the second-class mail privilege and served to swell the amount of second-class mail, which is carried at a heavy loss.

It is provided by the act of March 3, 1879, that a publication, to be entitled to entry as second-class matter, shall have a "legitimate list of subscribers" and shall not be "designed primarily for adver-

tising purposes, or for free circulation, or for circulation at nominal rates," the act clearly indicating the purpose of Congress that publications having the second-class mail privilege shall be circulated in response to a genuine public demand based on their merits. Therefore, for the purpose of correcting the abuses referred to, paragraph 3, section 419, Postal Laws and Regulations, was amended on March 30, 1917, so as to set forth more clearly the prohibition of the statute respecting circulation at nominal rates. To this end the regulation provides that subscriptions are regarded as at a nominal rate when a reduction is made to the subscriber of more than 50 per cent of the regular advertised subscription price, and also when they are obtained through agents on commission or in connection with clubbing arrangements with other publications when the amount received by the publisher, after deducting a commission or rebate or through other arrangements, is less than 50 per cent of the amount at the regular advertised price. This regulation has gone far toward placing the circulation of publications on a higher plane, and has met with the hearty approval of the vast majority of publishers who were glad to be relieved of the unfair competition which formerly existed.

In the administration of the law governing second-class matter it has been found necessary to revoke the second-class mail privilege of some publications because their contents consisted more or less of matter which was nonmailable under the espionage and other laws, and which, therefore, removed them from the class of publications entitled to that privilege.

POSTAL TELEGRAPHS AND TELEPHONES.

The President has heretofore transmitted to the Congress the report of the Postmaster General relating to the Government control of the wire systems, as was directed by the act of July 11, 1919, and reference is made to such report for the details of information relating to such Government control.

For a number of years the Postmaster General has advocated the Government ownership of the telegraph and telephone systems and has urged that they be blended with and become a part of the Postal Establishment, as essential agencies of communication. He is firmly convinced if such a policy were entered upon that where there are now two or three telegraph and telephone pole lines, and sometimes four, occupying the same highway and entailing immense waste, better and cheaper service could be given by one coordinate wire agency; that by the abolition of various supervisory forces of the wire systems which would then be unnecessary; by complete unification of the systems, thereby eliminating the operating cost of the useless system; by thoroughly coordinating the remaining telegraph and telephone

services; by the consolidation of offices and the utilization of post-office buildings where practicable; by the use of stamps as a means of eliminating costly and complicated accountings and the utilization of the auditing and accounting forces of the Post Office Department, thereby largely eliminating those of the wire systems, that such savings could be effected that would enable those in authority, during normal times, to materially reduce the cost of the wire service to the people.

As to the wisdom of this course the Postmaster General has not changed his views. At the time the Government took over the control of the wires extraordinary and abnormal conditions existed, resulting in a constantly increasing and very high operating cost, which necessarily continued during the entire period of governmental control. The early coming of the armistice, the accentuated cost of operation and diminishing revenues, the uncertainty in the period of Government control, presented such a situation that those in charge for the Government were able to accomplish but little by way of unification or to go forward with their policies of economy, and consequently were soon brought face to face with a very serious, but quite simple problem—increasing cost of operation with diminishing revenues. There could be but one answer—increase of rates. This action was taken. It was quite unfortunate and was taken with deepest regret, but it was imperative. To an intelligent mind this increase of rates constitutes no sound reason for a change of view on the original proposition that it is economically wise for the Government to own the wire systems as a part of the Postal Establishment, and in no sense tends to refute the soundness of the contention that through such ownership savings would be effected that would result in a reduction of rates. For example, street car companies and other public utility organizations throughout the country which are being operated under private control are in many cases on the verge of bankruptcy and are petitioning for an increase in rates for their services; and, when having been granted the increases sought, often return with petitions for still further increase, basing their claims upon the higher wages and increased cost of material. The Wire Administration could not escape this condition which extended throughout the country in relation to every form of service, public or private.

There is quite a difference between Government ownership of the wire systems as a part of the Postal Establishment and Government control for a limited and very uncertain period. The recent temporary control affords no more a test of the virtues of Government ownership than could be had through a temporary receivership in a court proceeding.

That the contention of the Postmaster General for a complete unification of the various wire systems is both wise from an economic standpoint and supported by sound business principles has been confirmed by the ablest experts on electrical transmission in America. That it should be brought about the Postmaster General still believes, through Government ownership and operation as a part of the Postal Establishment, and to that end renews the recommendations in previous annual reports that the telephone and telegraph systems of the United States be incorporated into the Postal Establishment.

COMPENSATION TO RAILROADS.

When this administration took charge of the Postal Service in 1913, the payment for carrying the mails on railroads was made under the act of 1873 and amending acts, and was based on an inflexible and illogical system of quadrennial weighings. Such a system was antiquated and had long been considered unsatisfactory. After a long and earnest struggle, legislation was obtained enabling the Government to pay for the transportation of the mails on what is commonly called "the space-basis plan."

This plan of payment of railroad companies for carrying the mails, with certain variations, had been approved by every commission which had studied the matter from the Hubbard Commission in 1878 to the Bourne Commission in 1913. The railroad companies, however, had been able to prevent any change from the weight-basis plan. On August 12, 1911, Postmaster General Hitchcock transmitted to Congress a plan of payment based on space and urged its adoption. No action was taken on his recommendation.

On February 12, 1914, the Postmaster General transmitted a complete scheme of payment based on space and actively championed it before the Congress. He succeeded in having it embraced in the pending Post Office appropriation bill in the spring of 1915. The organized opposition of the railroad companies was able to prevent passage of the bill prior to adjournment of Congress on March 4 of that year, so that for the first time in its history the entire Postal Service was compelled to operate for the ensuing year under the handicap of a joint resolution extending the previous year's appropriation.

The space-basis plan was finally authorized by Congress on July 28, 1916, and has been in operation since November 1, 1916. It is a scientific and businesslike method of railway mail pay and enables the department to pay for what it receives and the railroads to receive what they earn, which was not possible under the old system of average weights taken once in four years.

The new system enabled the department to carry out extensive reforms in the service, with the result that whereas the cost for trans-

porting the mails by railroads for the fiscal year ending June 30, 1916, was \$62,176,943.05, the cost for this service for the fiscal year ending June 30, 1919, with a largely increased volume of mail, was \$54,563,534.49. The department also as a direct result of the advantages of the new system, during the critical transportation period of the war, was enabled to remit to the railway companies for other transportation work 72,906,490 car miles per annum no longer needed for mail transportation. This, reduced to a 60-foot car basis, means 15 trains of 10 cars each, running every day between Chicago and New York. This great saving was accomplished through scientific loading of cars, rational rearrangement of letter distribution on cars, and elimination of dispatches of mail at periods when such dispatches by reason of trains not making direct connections failed to expedite the delivery of mail. So carefully were plans of the Post Office Department worked out and so flexible was the new system of space that during the trying war period, notwithstanding it was subjected to the severest test, when the freight and express agencies broke down and laid embargoes on shipments practically throughout that period, the Post Office Department was the only transportation medium that functioned unrestricted and transported not only the great normal parcel-post load but an immense additional parcel-post load thrown upon the department through the internal breakdown of these other agencies. This tremendous task was performed without interruption and with dependability and dispatch, except in so far as it was handicapped by the very irregular train schedules, and the reduction of train speed and withdrawal of trains by the railroads as necessitated by the exigencies of the war.

The amount expended out of the appropriation "Railroad transportation, 1919," for the transportation of the mails was \$54,563,534.49, as indicated by adjustments to November 12, 1919.

The following statement shows the scope of the authorized service on space and weight basis routes combined, as of June 30, 1919: Number of routes, 2,897; length of routes, 259,580.70 miles; annual travel, 519,674,375.69 miles (excluding emergency service); annual rate of expenditure, \$51,086,238.68; average rate of cost per mile of route, \$196.80; average rate of cost per mile traveled, 9.83 cents. (Detailed tabular statement will be found on page 185 of this Report, Table 22.)

The annual rate of regular authorizations on "space basis" routes, which, on June 30, 1918, was \$52,022,070.43, had, on June 30, 1919, been reduced to \$49,918,031.16. The lowest annual rate of authorized service since the inauguration of the space-basis system—\$47,706,842.46—was reached during the December quarter. It is obvious, therefore, that transportation requirements have been gauged and adjusted to the needs of the service. The annual rate

steadily increased during the June quarter, responsive to postal necessities, as indicated by the increase in the authorizations for the carriage of emergency and excess mails, space units being regularly authorized when emergency requisitions were repeated within given periods of time.

HEARINGS BY INTERSTATE COMMERCE COMMISSION ON QUESTION OF RAILWAY MAIL PAY.

In the investigation before the Interstate Commerce Commission as authorized by Congress into the question of the proper basis for paying railroads for carrying the mails, and as to the fair and reasonable rates for such service, extensive hearings were held in Washington on November 4, 1918, January 7, and from April 8 to May 6, 1919. At these hearings the department submitted the results of the inquiry made during the statistical period agreed upon and other evidence in support of the initial statement filed by the Postmaster General. The railroads also submitted their exhibits and offered their testimony. Thereafter the case was briefed and argument made before the full commission. The department believes that the space basis plan has been thoroughly justified, and that its contentions with reference to rates have been sustained. The decision and order of the commission is looked for at an early date.

MAIL TRANSPORTATION BY ELECTRIC CARS.

There was a slight decrease in the authorized service by electric-car routes during the year, owing to the extension of the Government-owned motor vehicle service in cities, and also to the cessation of war industries.

In pursuance of the act of Congress of July 2, 1918, the Interstate Commerce Commission instituted hearings for the purpose of fixing the fair and reasonable rates and compensation for the transportation of mails by urban and interurban electric railway common carriers and the service connected therewith, and to prescribe the method for ascertaining such rate or compensation. Accordingly proceedings were begun, and between June 9 and August 4, 1919, hearings were held in 18 of the principal cities of the country, representing the electric-car line centers. The results will be presented by the representative of the department and of the railroads to the Interstate Commerce Commission, with appropriate recommendations for fair rates.

SHIPMENTS OF BLUE-TAG MAIL BY FAST FREIGHT.

During the fiscal year the total shipments of periodicals (blue-tag matter) by fast freight consisted of 2,684 carloads, weighing 103,324,991 pounds, at a cost of \$866,639.63, being a decrease of 820

carloads, aggregating 16,630,046 pounds, and an increase of \$73,064.14 in freight charges, respectively, as compared with the business of the previous year. The cost of carrying this matter had it moved in the regular mails would have been approximately \$1,365,497.28. A saving to the department of approximately \$498,857.65 was therefore effected.

Of these shipments 2,598 carloads of a total weight of 99,031,448 pounds were moved over rail routes, or an average weight of 38,126 pounds per car. This is a decrease of approximately 6,434.100 pounds in the total weight, and an increase of approximately 4,126 pounds in the average weight per car as against the movements of the previous year. The cost of transporting the shipments, including freight, cartage, loading, handling, and other incidental charges was \$842,819.09, being an increase of \$70,050.32 over the amount expended for this purpose in 1918. This additional cost is due not only to the increase in freight rates allowed by the Interstate Commerce Commission, but also includes the greater expense in hauling, loading, and unloading the shipments, etc., due to other economic conditions.

In addition to the all-rail shipments of periodicals, mail matter originating at New York, Philadelphia, and New England points for the State of Texas was transported via steamer routes between New York and Galveston. A total of 4,274,543 pounds were transported in this manner during the fiscal year 1919, at a total cost of \$23,820.54, representing a decrease of 215,946 pounds, and an increase of \$3,013.82 in freight charges as against the figures for the fiscal year 1918. This increase was due to the higher rate allowed the steamship companies.

Since the cessation of the war activities the railroads have been able to maintain their schedule of fast-freight movements with regularity, and but few complaints of delays have been received which were attributable to the movement of this matter by freight. Twelve requests were received during the year from publishers for exemption of their publications from the blue-tag freight movement, seven of which were approved by the department.

RAILWAY MAIL SERVICE.

The distribution of circulars and catalogues practically has been eliminated from the working mail cars, the distribution being done in post offices and terminals at points of origin or delivery, and the distribution work on the trains has been concentrated on letters and daily newspapers. The result has been that although the mails have increased greatly since 1913, the Railway Mail Service in 1919, on trains and in terminals, has had less "stuck," left over, unworked mail than at any time in the history of the service.

The steady upbuilding of the personnel of the Railway Mail Service has been one of the accomplishments of this postal administration. The improvement of the type of the men in the service through the elimination of the shirking and disloyal element, the reduction of the long hours of continuous duty on trains, the increase of steel car construction for the safety of the clerks, and the steady increase of the annual rate of pay of railway postal clerks have been some of the notable developments in the Railway Mail Service since 1913.

At the close of the fiscal year ending June 30, 1913, there were in the Railway Mail Service 18,265 employees, and their annual average salary was \$1,239. On June 30, 1919, there were on the rolls of the service 19,683, and their average annual salary was \$1,573. By reason of the annual promotions which fell due immediately after the close of the fiscal year just ended, the average annual salary of the railway postal clerks rose to \$1,654, an average annual increase of \$415 per employee since June 30, 1913. These salary increases do not include the travel allowances given to approximately 13,000 road clerks. This average annual travel allowance was \$92 on June 30, 1913. It has increased to an average of \$114 per annum on June 30, 1919, and to \$190 per annum on September 30, 1919.

In the matter of providing safe car construction for the railway postal clerks great strides have been made. Since June 30, 1913, wholly wooden mail working cars were reduced from 3,444 to 718; steel underframe cars were increased from 322 to 762; and wholly steel cars were increased from 354 to 2,002.

The reorganization of space and personnel in the Railway Mail Service which occurred about two years ago has become fully adjusted to the needs of the service and the result is the complete efficiency of the past year.

Notwithstanding the disruption of railroad schedules the Railway Mail Service has functioned perfectly. The proof of this is that there was less unworked mail in the Railway Mail Service during the year than in any previous year of which there is a record, and a comprehensive investigation has shown that no serious delay to mail of any character occurred in the Railway Mail Service during the year. Unnecessary terminals have been eliminated and the others have been strengthened and brought to a higher degree of performance with a marked improvement in the handling of parcel-post and circular matter.

Since the conclusion of the war there has been a gradual improvement in the operation of railroad train schedules. A number of the trains which were withdrawn or discontinued during the war period have been restored, and the schedules of others have been shortened and otherwise modified, so as to furnish better connections for the transmission of mails. The passenger-train service, however,

is not as efficient as it was prior to the war and there is still an insistent demand on the part of the business interests throughout the country for adequate service. It should be stated that the railroad companies are now more responsive to the demands of the business interests and the Post Office Department, and it is hoped that shorter schedules will be put into effect and additional trains provided as rapidly as circumstances will permit. It should be added that the postal transportation service is limited to the facilities afforded by passenger-train service, over which the Post Office Department has no control.

PERSONNEL IN RAILWAY MAIL SERVICE.

The return from military duty of many former employees was followed by a marked improvement in the efficiency of the Railway Mail Service. The service, however, is not yet adequately manned with experienced help, but there is a steady increase in the number of appointments. There were 1,103 resignations of regular clerks, or 5.6 per cent of the total force. This represents a decrease of 142 in the number reported for the fiscal year ended June 30, 1918.

From the force of substitute employees there were 1,318 resignations from a total force of 2,754, or 47.8 per cent. During the year 2,717 eligibles certified by the Civil Service Commission declined appointment. The civil-service registers of eligibles were exhausted in a number of States, which, added to the difficulty of getting those on the registers to accept appointment, rendered it necessary to employ a large number of temporary, noncertified employees.

INCREASE IN SALARIES OF RAILWAY MAIL SERVICE EMPLOYEES.

The act making appropriations for the Postal Service for the fiscal year ended June 30, 1919, provided for increased compensation to railway postal clerks of \$200 for each grade, but it was also provided that no promotions should be made during the year. The appropriation act for the fiscal year 1920 continues the \$200 increase in each grade and also authorizes promotion in practically all grades below the maximum grade. The promotion rules have been made as liberal as possible, and during the fiscal year 1920 approximately 97 per cent of the clerks who have not already reached the maximum grades will be promoted. In addition to the liberal promotion standard the allowance for travel expenses was increased by the Congress from \$1.20 per day to \$2 per day.

OPERATION OF RAILWAY MAIL SERVICE.

On June 30, 1919, the supervisory force of the Railway Mail Service consisted of 15 division superintendents, 15 assistant division superintendents, 2 assistant superintendents, and 112 chief clerks.

There were 17,916 railway postal clerks (including 526 unassigned) and 1,625 acting railway postal clerks; a net decrease in the number of employees at the close of the year of 481, as compared with the number in the service at the close of the previous fiscal year. The net decrease in the total force is due to an increase of 520 in the regular force and a decrease of 1,001 in the unassigned and acting employees.

Railway post-office service was in operation on 217,873 miles of railroad, with 272,413,940 miles of annual travel.

There were 8,784,220,700 distributions and redistributions of pieces of first class and 6,177,846,279 distributions and redistributions of pieces of second, third, and fourth class matter, a total of 14,962,066,979 distributions and redistributions of pieces, exclusive of registered matter, by railway postal clerks during the year, an increase of 5.85 per cent over the previous year. Of the 14,962,066,979 pieces of mail matter distributed and redistributed 14,960,885,862 pieces or 99.99 per cent were distributed and redistributed correctly.

Of registered matter there were handled and rehandled in transit 83,172,682 letters, packages and cases, 6,760,389 rotary lock pouches and sacks, 3,853,975 registered package jackets, and 353,159 lead-seal sacks. In handling the registered matter above indicated, clerks made up and dispatched 2,821,823 rotary lock pouches and sacks; 1,140,051 registered package jackets containing 8,745,055 pieces; 4,179 lead-seal sack jackets containing 195,919 pieces; and received and opened 1,228,187 rotary lock pouches and sacks; 1,017,076 registered package jackets containing 8,167,313 pieces, and 11,494 lead-seal sacks containing 137,857 pieces.

READJUSTMENT OF THE POSTAL SERVICE.

In common with practically all other activities of a kindred nature, both governmental and private, employing large quantities of labor and dependent upon railroad transportation for success during the war, the postal service unavoidably deteriorated in some localities to a certain extent from the high standard previously maintained. This was a natural and inevitable effect of the war, due to conditions over which the department had no control, including impaired train service, loss of highly trained employees, inability to obtain competent clerical assistance to fill vacancies and delay in the receipt of equipment and supplies. Coupled therewith, in addition to handling a greatly increased volume of postal business and the provision of adequate postal facilities for the great Army camps established throughout the country, the department, owing to its extensive organization, was called upon to perform for other branches of the Government innumerable duties wholly foreign to the Postal Service, but which were vital to the successful prosecution of

the war. Notwithstanding these handicaps the Postal Service was continued throughout this critical period without curtailment or restriction of any character.

The war having ceased, the foremost object of the department was not only to restore the service to its prewar status but, with the broader experience gained, to increase its efficiency to a point not heretofore enjoyed in the history of the department. In past administrations, although answering its inquiries and endeavoring to meet its complaints, the department has not shown any disposition to take the public into its confidence. Believing such a policy to be fundamentally wrong, and that the most effective means of disclosing defects and determining the necessary reforms was to establish an intimate relationship with the business interests of the country, it was decided to go before the merchant, the manufacturer, the banker, in a frank, open letter soliciting earnest cooperation in placing the service on a thoroughly satisfactory basis through honest criticism of any shortcomings and practical suggestions for betterment. With this object in view on January 16, 1919, a personal letter was sent out to all postmasters of the larger cities, about 3,000 in number, directing them to make a comprehensive survey of their offices for the purpose of developing any inadequacies of the service, and, as a part of their campaign, to get into close touch with local commercial houses and their trade bodies to ascertain the character of the postal service from the viewpoint of the business man. This was followed on January 21 by a personal letter from the department to business organizations, such as the chambers of commerce and boards of trade, as well as to individual firms and corporations, approximately 12,000 in all, setting forth the purpose of the department and requesting their close cooperation.

Replies were received from some 2,500 postmasters and 4,000 business men and organizations. While some of these naturally contained complaints regarding the service and remedial suggestions, about 92 per cent expressed themselves as being entirely satisfied with the service. Still others stated that, while there might be room for improvement, they had considered the service remarkably good, knowing the difficulties occasioned by the war which the department had had to encounter. Each of these letters was carefully reviewed, and, in addition to the necessary departmental action, under date of March 18, a circular letter was addressed to the postmasters inclosing all complaining communications received from patrons of their respective offices, and directing them to call upon the writers personally for a further discussion of the cause of complaint with a view to its correction. With a report of the action taken by them the postmasters then returned these communications to the department for a second review and further action if necessary. Many of the com-

plainants stated that the unsatisfactory service was entirely due to the loss of expert clerks and to curtailed or interrupted train service.

The success of this effort to procure the cooperation and aid of the public being so great, their responses so prompt, cordial, and sincere, as a further step in the program there was held in the department at Washington on April 1, 2, and 3, a conference of representatives of business organizations and of the Postal Service. Those in attendance, in addition to the officials of the department located in Washington, included the postmasters of the 75 largest offices representing approximately 75 per cent of the entire postal business from a standpoint of office receipts, the 15 field superintendents of the Railway Mail Service, the 15 inspectors in charge, and representatives of prominent commercial organizations of the country, as well as of a number of the heaviest users of the mails. At this conference the most frank and intimate discussions of the Postal Service were had from every angle, covering every phase of the service from the use of stamps and envelopes to the intricate problems of housing and transportation. The chief defects of the service and most common sources of criticism were exposed, remedies were debated, and the matters referred to the proper bureaus of the department for corrective action. The general result has been not only a greatly improved mail service, but the establishment of harmonious relations between the department and the business world and a clearer understanding on the part of each of the difficulties and troubles of the other.

In line with the policy already so successfully followed, on June 19 a circular letter similar in purport to those previously sent out was addressed to the principle banks of the country, embracing about 30,000, to which more than 11,000 replies were received. Of this number over 50 per cent were highly complimentary, slightly more than 25 per cent offered suggestions for improvement without direct criticism, while less than 25 per cent contained specific complaints of the service. In reviewing these letters practically the same procedure was followed, all meritorious complaints being taken up with the postmaster for discussion with the complainant and correction.

The foregoing plan elicited only individual criticisms and opinions. Consequently, in the furtherance of the program adopted at the conference in April, the Chamber of Commerce of the United States of America, at the request of the department, on July 1, 1919, addressed a circular letter to the local chambers of commerce of the 50 largest cities, requesting each to appoint a committee for the purpose of making a close, analytical study of the postal conditions with a view to determining the underlying causes of any unsatisfactory service which might exist. These committees were directed to confer

with the postmaster and, after completing their investigations, to submit detailed reports of conditions as they found them with suitable recommendations for changes when deemed necessary. Simultaneously the department informed postmasters of this plan of cooperation and instructed them to work in conjunction with the committees and to afford them every facility and courtesy for carrying on their investigations. At the same time the department and the National Chamber of Commerce established committees in Washington for the purpose of considering the reports of postmasters and the local committees and insuring closer cooperation. While only a few of the reports have as yet been received, the results thus far have been highly gratifying, and are indicative of an earnest desire on the part of both the commercial bodies and local postal officials to give the department their heartiest cooperation in maintaining an efficient service.

Not only have many helpful suggestions resulted from this plan, but the business world is daily making its cooperation more direct and personal by facing and separating the mail and posting it continuously throughout the day, supplying complete addresses, using uniform envelopes, notifying the post office in advance of heavy mailings, and utilizing precanceled stamps and the permit system, all of which tend to facilitate the work of the post office and to expedite the dispatch of the mails.

While yet in its infancy, this policy of consulting the business man regarding his requirements in the way of the postal service has been followed sufficiently to demonstrate its wisdom and benefits, and in the future it will be made a permanent feature of postal administration. Thus will the department become fully cognizant of his needs and be thereby enabled to supply the necessary service in an intelligent and effective manner, while at the same time the business man will comprehend the problems and difficulties of the department and recognize the fact that its paramount desire is to satisfy the public by rendering the best possible postal service.

POST OFFICE SERVICE.

During the six-year period from July 1, 1913, to June 30, 1919, the number of first, second, and third class offices increased from 8,406 to 10,825, or 2,419. This increase was distributed among the different classes of offices as follows:

Classes.	1913	1919	Increase.
First class.....	485	665	180
Second class.....	1,979	2,539	560
Third class.....	5,942	7,621	1,679
Total.....	8,406	10,825	2,419

In the same period the combined salaries of postmasters increased from \$14,965,500 to \$19,285,700, an increase of \$4,320,200, or 28.9 per cent.

In 1919 the total number of clerical employees, exclusive of assistant postmasters, at first and second class offices was 44,681, as compared with 35,486 in 1913, an increase of 9,195, or 25.9 per cent. The expenditures for clerical service increased from \$43,668,732 to \$74,251,888, or \$30,583,156—70 per cent.

During this period the promotions of clerical employees numbered 112,179, involving an expense of \$15,889,710. The average salary of clerical employees is now \$1,318.03, whereas in 1913 it was \$1,052.97.

The total appropriations for post-office service, including city delivery, vehicle, etc., in the Bureau of the First Assistant, increased from \$121,660,275 to \$192,334,107, an increase of \$71,673,832, or 59.2 per cent.

Prior to 1913 the work at the larger offices was divided into five principal divisions which in turn were composed of minor subdivisions or sections. It was apparent that with such a wide division of authority and supervision there must be more or less friction between the supervisory heads, loss of time through the inflexibility of the working forces, and a lack of cooperation. After thorough investigation and a close analytical study of the matter it was decided to reorganize the larger offices in accordance with sound business principles and modern methods of postal management. As a result, during the past six years practically all post offices of the first class have been reorganized on the two-division plan, thus centering under two divisional heads the duties of supervision which were formerly dispersed throughout five or more independent divisions. The results attained have more than demonstrated the wisdom of this action through economy of management, effectiveness of supervision, coordination of the work, cooperation of service, and the standardization of salaries and allowances, uniformity in methods and equipment, and interchangeability of personnel.

Experience having shown the necessity for unity of service in post offices, as well as for a line of demarcation between mail transportation and post office service and, in the latter instance, the necessity of defining the jurisdiction within cities of the First and Second Assistant Postmasters General, on July 1, 1916, by authority of Congress, the Division of Post Office Service was created in the Bureau of the First Assistant Postmaster General. This was brought about by the consolidation under one directing head of all postal activities within a city which could be classed as purely post-office service, the new organization embracing the former divisions of Salaries and Allowances and City Delivery under the First Assistant Postmaster General, together with the Screen Wagon, Mail Messenger, and

Pneumatic Tube Service which were transferred from the Bureau of the Second Assistant Postmaster General. The effectiveness of administration within the Department, as well as the results obtained in the supervision of the work of post offices throughout the country, have fully justified this action.

The appointment of the different classes of employees and the authorization of all expenditures for the maintenance of post offices are now handled jointly, thus giving a broader knowledge of the requirements of the service and insuring closer cooperation.

In the matter of authorizing expenditures for auxiliary clerical and carrier assistance, allowances are now granted on a quarterly basis, for it is impossible for the postmaster to make accurate estimates of his requirements for an entire year.

The total number of post offices in operation on July 1, 1919, was 53,084. Of this number, 10,825 were assigned to the presidential grade, 665 of which were first class and 2,539 of the second class.

The policy inaugurated in 1913 of reorganizing post offices in accordance with sound business practices and correct principles of postal management was necessarily suspended during the period of the war. However, prior thereto practically all of the larger first-class offices had been reorganized on the "two-division plan," under which all financial operations and all mail handling activities are placed under separate supervisory heads. These two chief supervisory officers are coordinate in rank and responsible directly to the postmaster. Experience during the past five years has conclusively demonstrated the efficiency and the economical advantages of the two-division system as compared with the old five-division organization, and its benefits will gradually be extended until all first-class offices are embraced, with necessary modifications as the offices diminish in size and importance.

The clerical and carrier forces of first and second class offices, including substitutes, laborers, and special delivery messengers, now comprise more than 105,000 employees. To manage this large corps and direct the work requires the services of approximately 3,500 supervisory officers, exclusive of postmasters and assistant postmasters. As indicated, the work in the larger offices is centralized under two chief supervisory heads, thus avoiding an extensive division of authority and insuring close cooperation between the two divisions, as well as among the different sections of each division.

The administration of post offices became an increasingly serious problem during the war, due to the loss of thousands of highly trained men through the military and naval necessities, and the impossibility in some instances of obtaining sufficient additional employees with the requisite qualifications. Consequently, there was some deterioration in post office personnel throughout the country,

the same as in every industrial institution. During the ensuing fiscal year the most careful attention must necessarily be given to the appointment and training of employees with a view to again building up a force of unquestioned efficiency. Coincident with the restoration of an efficient personnel the department will continue its policy of standardizing both work and methods and introducing modern and effective equipment.

The post office is essentially the people's institution. It reaches every home and comes in contact with every business concern throughout the country. Therefore, in the very nature of things, close and honest cooperation between the public and the post office is essential to satisfactory service. The advantages of such a relationship are manifold. The patron can directly serve both himself and the department by equipping his residence, and place of business with mail receptacles; posting heavy mailings early and continuously throughout the day; placing his return address on all mail; informing the post office promptly of any change of address; addressing all mail completely and legibly; properly preparing all parcels and packages for the mails, etc. Furthermore, when the postal service is not up to the standard he can render an invaluable aid by offering constructive criticisms accompanied by suggestions for improvements.

In order that defects may be remedied and inefficiency stamped out the public is being urged, both directly by the department and through the postmasters, to make known the inadequacies of the service and the derelictions of its employees in order that remedial action may be taken. On the other hand, postmasters have been instructed to explain fully to their patrons the organization of the post office and its various functions in order that they may be in position to utilize this great organization to the fullest extent and participate in its many benefits. The response of the public has been prompt and cordial, many useful suggestions have been made, and the general results of this campaign for closer cooperation and a clearer understanding have been highly gratifying.

BRANCH POST OFFICES AND CONTRACT STATIONS.

It is deemed important to again invite attention to the advisability of removing the restrictions bearing on the establishment of branch post offices. Under existing law branch offices can not be established in villages having a population of less than 1,500, or which are more than 5 miles distant from the corporate limits of the city wherein the main office is located. The advantage resulting from the operation of central accounting and nonaccounting offices demonstrates fully that the department should have greater latitude in establishing branch post offices. The removal of the restrictions respecting the

establishment of branch offices would not affect the postmasters thereof, or the service to the public, but would greatly simplify accounting methods, and, in many instances, enable the department to inaugurate City Delivery Service. Legislation permitting the department to establish branch offices without regard to the population or distances between corporate limits is again urged.

In accordance with the recommendation of the Post Office Department, Congress by act of May 28, 1916, authorized the Postmaster General to enter into contracts for the conduct of contract stations for a term not exceeding two years. This change has resulted in material advantage, both to the department and to the clerks in charge of the stations, as it saves the department the labor incident to the making of approximately 6,000 contracts every year and also insures a greater measure of permanency to the station. As the designation implies, the conduct of these stations in the nature of contract service and the selection of a location is determined to a considerable extent by the amount of compensation demanded by a clerk in charge. Recommendation was made that contracts be made for a period of four years, but Congress expressed its preference for a shorter period and authorized a two-year term.

On June 30, 1919, there were 5,170 contract stations in operation. These stations are established in private places of business in cities having post offices of the first and second classes and provide facilities for the transaction of money order, registry, and insured parcel-post business, the sale of postal supplies, and in some cases the transaction of postal-savings business and the receipt and dispatch of mail. The department looks with favor upon the establishment of contract stations, as they afford convenient facilities for the public and reduce materially the congestion at the main offices and classified stations, where, on account of the rapid growth of the parcel post and the difficulty in securing additional space due to conditions attributable to the war, the offices and stations have become badly congested.

Formerly contract stations were considered desirable assets and were eagerly sought by drug and department stores because of the increase in their business attracted by the location of postal stations in such business places and numerous stations were established in such stores at a nominal compensation, but since the beginning of the war, there has been less competition for these stations and in some instances difficulty has been encountered in securing suitable locations for new stations or for existing stations, where the clerks in charge have indicated a desire to relinquish their contract.

Many of the larger cities have foreign communities and contract stations are particularly valuable in providing postal facilities for these communities. It is the practice to secure a popular person of

the nationality concerned to serve as clerk in charge. An arrangement of this character usually results in confining the postal business of the community to the particular station, thereby relieving the main office of the necessity of securing clerks of the different nationalities with which postal business has to be transacted.

CITY DELIVERY.

In the past six years free delivery of mail by letter carriers has been established in 343 additional offices, carrying therewith the appointment of 730 regular carriers. Such establishments, coupled with the extension of free delivery in other cities, have extended this service to approximately 7,000,000 additional people.

As an indication of the extension and growth of the City Delivery Service since 1913, the expense of maintenance has increased from \$36,600,544 to \$59,527,296, or 63.1 per cent, and the number of regular carriers from 30,923 to 35,024, or 13.3 per cent. During this period carrier promotions have numbered 78,263 at a total cost of \$11,501,700. The average salaries of carriers in 1919 was \$1,305.02 as compared with \$1,087.57 in 1913.

Prior to 1913 nearly all mail in cities was delivered by foot carriers, who also made collections from street letter boxes, as the weight limit on a single piece of mail of any class was four pounds and the average weight of parcels was less than six ounces. Through the institution of the parcel post the volume of fourth class or parcel post mail has been many times multiplied until approximately 2,750,000,000 parcels are now handled annually. The average weight of parcels now exceeds three pounds with a maximum of 70 pounds. As approximately one-third of all parcels are received for delivery at city carrier offices, there has in this period been a transition in the method of effecting delivery which has necessitated the installation of an efficient and comprehensive system of motor-vehicle service.

With a view to conserving the time of carriers, avoiding excessive loads, and at the same time expediting the delivery of mails, motor vehicles have been utilized extensively in making collections and re-laying bundles of mail to the foot carriers while serving their routes.

Through encouragement and stimulation the use of private mail receptacles at residences and places of business has been greatly extended as a means of increasing the efficiency of the service, their provision now being one of the requirements for the establishment or extension of City Delivery Service.

In so far as possible in connection with local conditions, the work of carriers throughout the country has been standardized. Routes, schedules, and frequency of service in the different cities have from time to time been adjusted in order to eliminate inequalities and in-

sure uniformity of service, and modern, standardized equipment for the use of carriers has been installed.

During the fiscal year just closed City Delivery Service was inaugurated at 27 additional offices, making a total of 2,019 city delivery offices. This new service involved the authorization of 54 additional carriers and the increase in the number of carriers authorized at other offices was 431, making a total increase of 485. However, due to abnormal labor conditions, which naturally resulted in an increase in the number of resignations, and inability of the Civil Service Commission to promptly supply eligibles for appointment to fill vacancies in some instances, the total number of regular carriers actually on the rolls at the close of business June 30 was only 35,024, against 34,993 at the close of the preceding fiscal year, or a net increase of 31. It was necessary to grant auxiliary allowances in lieu of carriers which were authorized but could not be appointed for reasons stated.

While the department has followed a liberal policy in the establishment and extension of City Delivery Service, due to the decrease in available man power and other correlated causes incident to the war, the growth of the service has not been so pronounced as in former years. In no instance has the department declined to authorize the establishment of City Delivery Service where the population and volume of business transacted were sufficient and the civic requirements had been met. As a matter of fact, in a few cases where owing to unusual conditions the necessity for City Delivery Service was especially urgent, the usual requirements were waived and the service installed. Notwithstanding this liberal policy during the war and immediately following, there was a considerable reduction in the number of applications for the establishment of City Delivery Service as compared with former years, and in several instances where applications were already pending the persons interested voluntarily suggested that establishment be deferred until the close of the war. While such suggestions were not followed by the department, this attitude is indicative of the deep spirit of patriotism and self-sacrifice which prevailed among the entire American people during this period, and accounts, at least in part, for the small number of initial installations of City Delivery Service during the war.

Realizing the universal feeling in this regard and fearing that it might lead to detrimental economies, the department especially impressed upon postmasters the fact that under no circumstances must service be denied or curtailed because of war conditions, so long as the necessary man power could be obtained.

The increased use of automobiles has greatly added to the efficiency of the delivery and collection of the mail. This is especially

true with respect to the delivery of parcel-post mail, the transporting of foot carriers to their routes, and the relaying of extra bundles of mail to carriers on their routes. Thus not only is the overloading of carriers avoided but the delivery of mail is greatly expedited. The department is also experimenting in the collection of parcel-post matter from large firms which deposit mail of this class in considerable quantities, and if found to be practicable this service will gradually be extended in the larger cities. As delays in delivery inevitably result from inadequate collection service, particular attention has been given to the arrangement of collection schedules with reference to the dispatch of important mails and the prompt movement of mail for local delivery.

The effect of the war on the carrier force has not been so generally noticeable as in the case of clerks. There have, of course, been many vacancies due to carriers entering the different military and naval organizations. On the whole, however, the department has been able to maintain an adequate force through the use of temporary employees, and, in a few cases, the employment of female carriers.

While refraining from the withdrawal of service already in operation, it has been the purpose of the department to equalize the City Delivery Service in cities of corresponding size, population, train schedules, and of the same relative importance with a view to establishing uniformity throughout the country. At the same time, proper consideration has in all cases been given to any peculiar conditions or requirements which may exist, the object being to provide service for each community fully adequate to meet its needs.

PAYMENTS TO MAIL MESSENGERS AND SCREEN-WAGON CONTRACTORS.

Complying with the recommendation of the Post Office Department, Congress by act of July 28, 1916, authorized the Postmaster General to designate postmasters as disbursing officers for the payment of mail messengers and others engaged under their supervision in the transportation of mails. Acting under this authority the Postmaster General on October 1, 1916, designated the postmasters of offices showing a surplus of receipts sufficient to meet the expenditures to make payments to mail messengers and screen-wagon contractors on the first of the month following that in which service was rendered in all cases where there had been no delinquencies or omissions. This action greatly advanced payments to contractors for screen-wagon service in the 260 cities where such service was in operation and also payments to practically all of the 8,400 mail messengers of record at that time.

GOVERNMENT-OWNED CITY MOTOR VEHICLE SERVICE.

Prior to the fall of 1914 all vehicular service in connection with the transportation of mail was secured under contract. The magnitude

of the vehicle service necessary for the proper handling of mails in the larger cities was fast developing a serious situation with which the department would soon be unable to cope, except by entering into contracts at exorbitant rates. Competition for vehicle service in these cities could easily be stifled by one set of contractors through the organizations of corporations in the various States where the service was to be performed. An officer of one parent organization, which either had under contract or had submitted bids for the service in several of the most important cities, openly boasted that he would crush his competitors and soon gain control of all of the large contracts. It was found that in some instances when bids were invited for service in the very large cities the bidder could obtain a bond from only one surety company, and in order to do so it was necessary to disclose to the agent the amount of the bid, thereby affording a further opportunity for a combination between one set of bidders and the bonding company, with the object of compelling the department to pay exorbitant rates for the service required. Not satisfied with obtaining money from the department which it was entitled to receive under its contract, one company succeeded in adding many unnecessary trips to the vehicle schedule, thereby greatly increasing its compensation. It is regrettable to say that to further defraud the Government an officer of the company having this contract bribed an employee of the Postal Service to abstract from the files the reports of delinquencies and failures on the part of the company, thereby enabling it to escape the fines which otherwise would have been imposed and keep the department in ignorance of the inferior service it actually rendered. This practice was soon discovered, the conspirators prosecuted and imprisoned, and the company compelled to return to the department a compensating sum for the losses suffered.

An efficient and economic transportation service is one which meets the reasonable needs of the public at the minimum cost. To secure this combination it is essential that there shall be a coordination of the work of the various branches of the postal service coming in direct contact with the public and that the collection, distribution, transportation, and delivery of the mails within a city shall be brought under one supervisory head and conducted by those familiar with the needs of the public and interested solely in solving the postal problems in the particular city. A condition of this character is impracticable in the larger cities under the contract system owing to the division of local authority as regards the means of transportation and the divergent responsibilities and interest of the two agencies. The chief object of the contractor is naturally one of profit, while the aim and purpose of the postal officials is one of service. The contract system in the larger cities developed a constant fric-

tion between the contractor and the local postal officials, while under Government ownership that complete harmony and cooperation among the various branches in handling the mails so essential to a successful operation of any service is not only possible, but is inevitable.

In the light of the conditions hereinbefore related, the Postmaster General recommended the enactment of legislation that would permit the department to perform the vehicle service with Government-owned equipment and Congress in providing funds for screen-wagon service for the fiscal year 1915, took favorable action on the recommendation.

Government-owned motor vehicle service was first inaugurated in Washington, D. C., on October 19, 1914, and since that date the service has been extended to the following 27 cities: Atlanta, Ga.; Chicago, Ill.; Indianapolis, Ind.; Baltimore, Md.; Boston, Mass.; Detroit, Mich.; St. Louis, Mo.; Jersey City, N. J.; Brooklyn, Buffalo and New York, N. Y.; Cincinnati and Columbus, Ohio; Philadelphia, Pittsburgh and Scranton, Pa.; Nashville, Tenn.; Norfolk and Richmond, Va.; St. Paul and Minneapolis, Minn.; Far Rockaway, Flushing and Staten Island, N. Y.; Cleveland and Toledo, Ohio, and Milwaukee, Wis., service in the eight cities last mentioned having been established since July 1, 1919.

To transport the mail in the cities where Government-owned service is now in operation it requires 1,692 trucks, ranging in size from $\frac{3}{4}$ to 3 tons capacity and to operate these trucks requires the services of approximately 1,880 persons, employed as mechanics, chauffeurs, garagemen, supervisory officials, and clerks.

It is proposed to extend Government-owned service to 30 additional cities during the remainder of the current calendar year, and it is expected that 2,100 Government-owned trucks will be in use in the mail service by January 1, 1920, and that the personnel will then number 2,250 employees.

The majority of these cities in which it is proposed to establish Government-owned motor vehicle service are located in the third contract section, comprising the States of Illinois, Indiana, Iowa, Kansas, Michigan, Missouri, Ohio and Wisconsin, where the contracts for screen-wagon service and the rental of vehicles for use in the collection and delivery service expired on June 30, 1919, and the service is being conducted under a temporary extension of the contracts, which can not be continued beyond December 31, 1919.

Congress authorized the Secretary of War (act of July 2, 1918) to turn over to the Postmaster General such motor trucks and motor-truck equipment as is not suitable for military purposes, and acting under this authority, the War Department approved the transfer to the Post Office Department of sufficient motor trucks to meet the re-

sonable requirements of the Postal Service during the ensuing five years. Only a part of the trucks to be transferred are in the possession of the Post Office Department, but additional trucks are being received daily. In some instances only chassis are transferred, while in other cases chassis are delivered equipped with bodies unsuitable for use in the mail service. It therefore will be necessary for the Post Office Department to have screen bodies manufactured and mounted on the chassis before the trucks will be suitable for mail transportation. Furthermore, it has also been found necessary to make extensive alterations to some of the chassis to place them in condition to receive the screen bodies used in the mail service. The trucks received from the War Department that can not be placed in the service immediately are jacked up, blocks placed between chassis frame and axles to relieve tension of springs, pneumatic tires removed and deflated, and cylinders and other metal parts oiled, after which the trucks and parts are stored in buildings rented for the purpose. The expense of storage amounts to less than \$12 per year per truck. Tires, tubes, and other parts that deteriorate rapidly are being used in the cities where Government-owned service is now in operation, and this practice materially reduced the expenditures for motor-truck parts during the last quarter of the fiscal year ended June 30. The practice will also reduce expenditures during the greater portion of the fiscal year 1920, as sufficient tires and tubes are on hand or have been promised by the War Department to make it unnecessary to purchase any of those items except to meet emergent cases.

The Secretary of War has approved the transfer of 5,778 motor trucks and 1,087 motor cycles to the Post Office Department.

Of the motor cycles received from the war Department 284 have been assigned to post offices for use in the mail service.

Any question which may have existed as to the relative merits of Government-owned vehicle service and contract service has been dispelled, the value of Government-owned service having been thoroughly established during the period of the war, when in many instances contract service became disrupted and demoralized under the pressure of abnormal conditions. Government-owned service has been extended gradually, its installation in each particular city following only after a thorough investigation, and it is proposed to continue this practice in the extension of the service.

Congress realizing the additional burden placed upon contractors for furnishing vehicles used in the transportation of mail as the result of the unusual conditions resulting from the war, incorporated a provision in the act, making appropriations for the maintenance of the Postal Service during the fiscal year 1919, authorizing the Postmaster General to investigate conditions arising from con-

tracts in the screen-wagon and other vehicle service entered into prior to June 30, 1919, with a view to determining whether any adjustments should be made in the compensation of the contractor and to adjust the same for services and materials thereafter to be furnished in cases where the facts disclosed the necessity for such an adjustment or with the consent of the contractor and his bondsmen to cancel the contract. In compliance with the intent of the act specially instructed representatives of the Postal Service were directed to make investigations with a view to ascertaining the effects of the war upon the vehicle contracts in order that the action taken by the department on the many cases to be reviewed would be uniform and equitable. As the result of these investigations, it was found that but few of the contractors maintained records sufficiently complete to show definitely the effect of the war on the cost of executing their contracts, and it has therefore been difficult to make satisfactory adjustment in many of the cases. Practically all of the contracts subject to adjustment have been acted upon and it is found that the average increase granted amounts to 31 per cent of the contract rate. It has been necessary to order reinvestigations in a number of instances and this has delayed action on a few of the 11 outstanding cases.

PNEUMATIC TUBES.

The act of July 13, 1892, making appropriations for the service of the Post Office Department, authorized the Postmaster General "to examine into the subject of a more rapid dispatch of mail matter between large cities and post-office stations, and transportation terminals located in large cities by means of pneumatic tubes or other systems."

Acting under this authority the Postmaster General, under date of July 26, 1892, issued an advertisement inviting interested parties to submit descriptions of pneumatic tubes "and an offer to submit test." The first pneumatic tube for the transmission of mail was used in Philadelphia in 1893 in an experimental way.

March 1, 1894, the service was formally recognized and paid for by the Post Office Department. Investigation shows that pneumatic tubes had not been a success for commercial purposes. A line of 10-inch tubes about $4\frac{3}{4}$ miles long was laid in Boston for commercial uses, but was not a success, and was subsequently leased to the Post Office Department on November 1, 1906, for the transmission of mail, at a rental of \$17,000 per mile per annum, for a period of 10 years.

From 1897 to 1918, excepting 1902, when Congress declined to appropriate for this service, a total of \$11,752,567.16 had been expended for the use of pneumatic tubes.

After an exhaustive investigation, during which there was adduced the testimony not only of postal experts of years' experience but that of many others sincerely interested in the betterment of the service, the Postmaster General recommended the discontinuance of pneumatic-tube service. That system of transporting mails was beyond question extremely costly and at the same time very inferior to the more modern methods of transporting mail. Congress failed to appropriate funds for the maintenance of pneumatic tubes during the fiscal year beginning July 1, 1918, and their use as a means of mail transmission was finally dispensed with at midnight on June 30, 1918.

It is estimated that the mail formerly transmitted through pneumatic tubes, at an annual expense approximating \$1,000,000, is now carried more expeditiously in Government-owned motor trucks at an expense of less than \$400,000 a year.

TUNNEL OR UNDERGROUND ELECTRIC RAILWAY FOR THE TRANSMISSION OF MAIL IN NEW YORK.

In the last annual report of the Postmaster General reference was made to the desirability of securing means by which mail of all classes within the congested district of New York City might be carried underground without the necessity of breaking packages.

In February, 1911, a committee appointed by the Postmaster General of Great Britain to consider the question of the transmission of mails in London, after an exhaustive investigation of the practicability of the pneumatic tubes as then operated in six of the largest cities of the United States, discarded the American system of pneumatic tubes from their consideration because of the restricted capacity of the containers used and its inability to carry all of the first-class mail and recommended an underground electric railway system as the only practicable method of transit that would adequately meet the requirements of London. I am informed that a tunnel for this purpose was under course of construction in London at the time war was declared, but its completion has been delayed.

As conditions in New York were analogous to some extent to those in London, the Post Office Department under date of October 24, 1912, appointed a committee to investigate and report on the advisability of the establishment of mail service between the Grand Central and the Pennsylvania terminals in New York, N. Y., either by a pneumatic or an electric tube system. Under date of February 1, 1913, this committee recommended to the Postmaster General that steps be taken looking to the establishment of service by tunnel or tube operating carriers not less than 24 inches in diameter between the points named.

Because of the establishment of the parcel post in January, 1913, it at once became apparent that a container 24 inches in diameter

would not provide for the transportation of all classes of mail and investigation was continued into the feasibility of an underground system having sufficient capacity to carry all mail of all classes between the three principal mailing points in New York.

Under date of April 12, 1918, an exhaustive report was submitted by engineers wherein they outlined a plan of underground transportation in New York, by subways, that appears to be entirely practicable and can be constructed at a reasonable cost. This plan contemplates the building of a subway between the Grand Central Station and the main post office at Pennsylvania Railroad Station, between which points the largest tonnage of mail is transported and where the principal connections are made between the northern and southern sections of that city; also a connecting line to City Hall Station, formerly the general post office.

A subway connecting the Grand Central Station with the Pennsylvania Terminal post office, which it is recommended be first constructed, will cost for construction approximately \$1,125,000, and for equipment \$353,000, making a total cost of \$1,478,000, according to the estimate of the engineers, and will result in a very material saving in yearly operation over the present cost of vehicular service. As the most congested streets in the city are crossed in performing surface transportation between these two points, it would appear that the route suggested would afford an ideal test of both the practicability and economy of the underground system. Should this service prove practicable and economical, it should be extended to City Hall Station at Broadway and Park Row, thereby giving to New York a system of underground mail transportation superior to that operated in any other city in the world.

A comprehensive system should also be worked out for similar transportation in other cities where the quantity of mail and the congestion of traffic justify it.

The Secretary of War has been requested to detail one or more engineers of the Army to make a thorough study of the subject and the results of this study will be submitted to the Congress as soon as completed and reported.

It is urgently requested that an appropriation of \$1,500,000 to be paid from the surplus postal revenues of the fiscal year 1919 be made by the Congress so as to enable the department to commence without delay the construction of a tunnel between the Grand Central Station and the Pennsylvania terminal post office.

PHYSICAL VALUATION OF PUBLIC BUILDINGS USED FOR POSTAL PURPOSES.

During the fiscal year ended June 30, 1914, for the first time in the history of the Postal Service, the Post Office Department had an inventory made of the Federal buildings used in whole or in part for

postal purposes and found that the total present value of the buildings, sites, and equipment chargeable to the Postal Service amounted to \$115,266,213.91, and that the rental value of the property used by the Postal Service was \$6,402,257.44 annually.

It has frequently been stated during recent years that had the department paid rent for the space it occupies in Government-owned buildings there would have been no surplus postal revenues. This statement is erroneous. The department could have paid rental for such space at the rates prevailing in the various cities and still have had a surplus some years of several millions of dollars, notwithstanding the fact that no credit was allowed for the transportation and handling of franked and free matter. If postage at the prescribed rates had been paid on such matter, the Postal Service would have received revenue amounting to more than three times as much as the rental for the space utilized in Government-owned buildings.

SELECTION OF SITES FOR GOVERNMENT BUILDINGS.

The Postmaster General in his annual report for the fiscal year ended June 30, 1913, recommended that all sites for Federal buildings to be used exclusively for post-office purposes be selected by the Post Office Department. While Congress failed to act favorably on the proposed legislation, the object to be attained was partially accomplished by an agreement between the Treasury and the Post Office Department, whereby the Secretary of the Treasury refers to the Postmaster General for review and recommendation all cases involving the selection of sites for post-office buildings. This action enables the Post Office Department to have one of its representatives make an inspection of the different locations offered and submit a report regarding their relative desirability from a postal service viewpoint.

Inasmuch as the location of a post office has a very material bearing on the cost of the city delivery service and mail transportation, it is highly important that the Post Office Department should have the right to select sites for post-office buildings. Under existing law authority to select Federal building sites for postal purposes is vested in the Secretary of the Treasury.

FEDERAL BUILDINGS.

The act of March 4, 1913, created a Public Buildings Commission, composed of the Secretary of the Treasury, the Postmaster General, the Attorney General, and four Members of Congress. The commission was instructed to "present to Congress a connected scheme, involving annual appropriations for the construction and completion of public buildings heretofore authorized within a reasonable time, and * * * frame a standard or standards by which the size of

the public buildings shall, as far as practicable, be determined, and * * * report as to the adaptability in size, accommodations, and cost of buildings hitherto authorized to the communities in which they are to be located; and also whether the existing appropriations shall be increased or diminished to meet such requirements." On April 30, 1914, the commission presented to Congress a report signed by a majority of the four members, dissented to in minor details by one other member, and accompanied by a letter from the Attorney General stating that he had been unable to study the subject sufficiently to enable him to arrive at a fixed conclusion. The Postmaster General after an exhaustive investigation, dissented fundamentally from the views of the majority and submitted a minority report, presenting clearly and in detail the reforms he advocated in the then existing method of authorizing and constructing Federal buildings. The report of this commission was printed as a public document (H. Doc. No. 936, 63d Cong., 2d sess.), and special attention is invited to the minority report, hereinbefore mentioned on page 15 thereof.

While neither of the reports have been acted upon by Congress, there has been no public buildings legislation since the act of March 4, 1913, and therefore the failure of Congress to prescribe a public building policy has been of no consequence.

The proper policy with regard to the construction of public buildings would seem to be one under which buildings would be authorized primarily for economic reasons and constructed principally for utilitarian purposes. It is a waste of public funds to erect buildings of a monumental type and it would, therefore, seem advisable to construct buildings of the factory type, where a maximum space with adequate light and ventilation can be secured at a minimum cost. The effect of such a policy would be to subserve the material interest of the Government and to make possible orderly procedure under a logical program. The minority report accompanying the report of the Public Buildings Commission sets forth the need for clearly defined policies with respect to authorizations and construction of public buildings and proposes standards for the guidance of Congress in authorizing public buildings and for determining the size and limit of cost of each building.

It is the view of the Post Office Department that a public building for post office purposes only is not warranted unless the rental paid for Government offices is as much as \$1,000 per annum, and then only when either the gross post-office receipts amount to as much as \$15,000 or the population is as much as 5,000.

This report was officially indorsed by a former Supervising Architect of the Treasury Department and also by the American Institute of Architects in letters addressed to the Postmaster General under

dates of May 16 and November 11, 1914, respectively. The feasibility of standard plans for reducing the amount of technical services required and for expediting the work of construction is established by means of tabular statements. These standards were applied to all pending authorizations, and it is shown by comparison that had Congress been able to avail itself of such standards in framing the act of March 4, 1913, the appropriation of \$41,797,350 might have been curtailed by more than \$15,000,000 without sacrificing any substantial benefits to the Postal Service or to the people in the communities affected.

Under existing law plans for public buildings to be occupied in whole or in part by the Postal Service require the approval of the Postmaster General and this approval is not given until after the plans have been carefully reviewed by a board of Postal Service experts designated for the particular service. In reviewing the plans for buildings authorized by the act of March 4, 1913, and also by previous acts, this board made practicable application of the views expressed by the Postmaster General in connection with the type of building that should be provided for post offices with the result that a material saving was effected in the cost of construction, and better lighted and better ventilated buildings were secured for Postal Service.

GOVERNMENT BUILDINGS AND POST-OFFICE QUARTERS.

In October, 1918, a list of offices occupying Government buildings, where insufficient workroom space was available to permit the postal business to be transacted in an expeditious and economical manner, was submitted to the Committee on Public Buildings and Grounds, House of Representatives. However, there has been no public-building legislation since the act of March 4, 1913, and building operations on the projects authorized by that act were curtailed during the period of the war. The parcel post was established only two months prior to the enactment of the last public-buildings bill, and it is that branch of the service that has had such a remarkable growth and for the handling of which provision must be made immediately. The suspension of construction work on authorized projects, the failure to provide for additional extensions, and the inauguration of the parcel post have brought about a serious situation with respect to space, both in Government-owned post-office buildings and in quarters rented by the department.

The space situation is particularly acute in the larger cities, where the increase in the volume of mail handled is far in advance of the normal increase for the entire country. Practically every postal station of the New York office occupying quarters leased prior to January 1, 1916, is in urgent need of additional space and in some

cases it is only with the greatest difficulty that business is being transacted in the accommodations available. This is especially true in the case of Foreign Branch Station, where the lease on the quarters will expire October 8, 1920. The greater portion of the foreign mail of the entire country passes through this station and although the matter of securing larger quarters has been under investigation by representatives of the department since January 1, 1918, it has been impossible to obtain a proposal to provide the required amount of floor space. The inspectors who have been conducting the investigation report that not less than 130,000 square feet of floor space should be obtained for this station and that if a 20-year lease is made the rental will be approximately 25 per cent less per annum than in the event a lease is made for a period of only 10 years, which is the maximum time for which a lease can be made under existing law.

The quarters occupied by Hudson Terminal, City Hall (formerly the main post office) and Wall Street Stations, and Station P (located in the Customs House) contain only 226,500 square feet of floor space, and are wholly inadequate to the needs of the service. To properly accommodate the business of these four stations, 400,000 square feet of floor space should be available.

The entire space available for the transaction of postal business in the Federal building at Chicago provides less than 400,000 square feet of floor space, and a large part of this space has been secured at a sacrifice of natural light, as it has been necessary in order to increase available space to floor over many light wells. A new building containing approximately 1,200,000 square feet of floor space should be authorized for Chicago, as it is believed that the different branches of the postal service will require that amount of floor space prior to the year 1935. Even with the additional space that will be provided by the suggested new building, it is contemplated to retain space in the present building for the administrative offices.

The workroom of the quarters occupied by the main post office at Philadelphia contains 41,000 square feet of floor space, while not less than 100,000 square feet are required to meet existing needs of the service. If a new building is erected, not less than 200,000 square feet of workroom space should be made available.

The workroom of the quarters occupied by the main post office at Boston contains 19,500 square feet of floor space, while not less than 65,000 square feet are required to meet existing needs of the service. If a new building is erected, not less than 90,000 square feet of workroom space should be made available.

The quarters occupied by the post office at Detroit have been inadequate for several years and at this time not less than 100,000 square feet of floor space should be available for workroom purposes. The workroom of the quarters now occupied contains less than

35,000 square feet of floor space. So urgent is the need for additional workroom facilities in this city that the Post Office Department recently requested the Secretary of the Treasury to secure outside space for the Internal Revenue Bureau, in order that the rooms now occupied by that branch of the service may be surrendered to the Postal Service.

Even should Federal buildings be authorized at the next session of Congress to relieve the congestion at New York, Chicago, Philadelphia, Boston, Detroit, and other cities, in view of the time that will elapse before the structures can be occupied, it will be necessary to secure additional space under lease for some years to come. Existing law authorized the Postmaster General to enter into leases for post office quarters for a period not exceeding 10 years. In the larger cities, it is practically impossible to secure adequate space properly arranged in buildings already erected, but it is usually possible to find suitable locations and to arrange with the owners to erect temporary buildings thereon and lease them to the Postal Service.

In such cases, the owners fix the rental at a figure that will not only reimburse them for the expense incurred in erecting and equipping the building but also to pay all taxes and other charges levied against the property, which in most instances is being held awaiting a material advance in real estate values or with the object of erecting a large permanent building for private business purposes at the expiration of the department's lease. It is an established fact that where the department makes a lease for post office quarters, the lessor prorates the cost of equipment over the term of the contract and the equipment is paid for as rental, title remaining in the lessor at the expiration of the lease. It is further true that where a temporary building is erected, the cost is also prorated over the term of the lease. Thus the Government pays for both the building and equipment during the period of occupancy, but at the termination of the lease the title to both remains vested in the lessor.

In the light of these facts it is highly important that greater latitude be permitted in the leasing of buildings for post office purposes, with special reference to the period of occupancy. It is believed that authority should be granted to enter into leases in the larger cities for a term not exceeding 20 years. This would enable lessors to prorate the cost of equipment and temporary structures over a period of 20 years, thereby enabling them to submit much more reasonable offers and at the same time insure to the department a longer period of tenancy.

In renewing leases for post office quarters or in leasing new quarters the increase in rental varies from 25 to 100 per cent, and in some instances even more, over the amount paid under expiring con-

tracts. With a view to relieving the present congestion and for the purpose of providing space to meet the needs of the service in the near future, investigations for new or enlarged quarters are pending in many of the larger cities. Furthermore, there are approximately 4,600 post offices assigned to the lower grades of the third class occupying quarters on a monthly rental basis and the owners thereof make frequent demands for additional rental for the use of their property. These increases in the aggregate result in a heavy charge against the appropriation for rent, light, and fuel.

Another matter of pressing importance at this time is the inadequacy of the maximum allowances that may be granted for rent and for light and fuel for post offices of the third class. The act of May 27, 1908, ch. 206; 35 stat., 410, provides that—

There shall not be granted for the use of any third-class post office for rent a sum in excess of \$500, nor more than \$100 for light and fuel, in any one year.

Due to the unusual conditions resulting from the war the department has had the greatest difficulty in obtaining quarters and equipment of any description for the larger offices of the third class, within the maximum rental authorized by law, and the cost of fuel and light at such offices in almost every instance exceeds the maximum authorized expenditure for those items. It is recommended that when the next Postal Service appropriation bill is enacted the maximum for rent and for light and fuel for post offices of the third class be increased to \$720 and \$180 a year, respectively, as it is believed that within these amounts satisfactory accommodations, including heat and light, can be obtained for post offices of the class in question.

The standard form of lease used by the Post Office Department contains a clause authorizing the Postmaster General, in his discretion, to cancel the contracts upon three months' notice and, while this provision is exercised only in those cases where quarters become inadequate and the lessor is unable to furnish, or declines to furnish, additional space upon reasonable terms, it is nevertheless a matter of frequent objection on the part of prospective bidders, and in almost every instance a higher rate of rental is charged than would be the case were the cancellation provision omitted from the lease. While this feature of the lease is an administrative matter, it is believed that it should be modified and, if authority is granted, to enter into leases for a period not exceeding 20 years it is the intention to have the cancellation provision recite that the lease will not be terminated until 25 per cent of the period has elapsed, and then only by giving the lessor one year's advance notice.

POSTAL ORGANIZATIONS.

In my 1917 report I recommended the repeal of the act of August 24, 1912, which is construed to permit the affiliation of postal em-

ployees with labor organizations which sanction recourse to the strike or boycott to enforce their demands.

I most earnestly renew this recommendation and again call the attention of Congress to the impropriety of Government employees owing allegiance to any organization which might stand between them and the Government, and to the actual menace to governmental authority which is involved in such affiliation.

The avowed purpose of labor organizations is not alone to advance the social and economic welfare of members of their order but to exercise a coercive influence upon the employer to compel submission to their demands. It is for the purpose of coercion that strikes and boycotts are resorted to. The strike and the boycott are weapons designed to be used in attack or in resistance. The Government of the United States is not to be attacked or resisted by any citizen of the land. Surely no such special privilege is reserved to those who, through the nature of their employment, are sworn to serve the Government itself and owe to it the special allegiance of service duty.

It can be only upon the assumption that the Government is unjust, tyrannical, and compliant to force alone that the contention can be sustained that Government employees require the support of an outside organization to compel the Government to respect their rights and do them justice.

Organizations which sanction strike and boycott serve the private interests of the members of the order. The labor organizations are formed as a defense against employers. When the employer is the Government of the United States such an association of its employees is aimed at the Government and is inconsistent with the performance of public service.

Whatever interest labor may claim in the products of its toil, it can not be claimed for Government employees that they acquire a larger interest or greater power in the Government than that of other citizens, because of the character of their employment. They have no right to make an excuse of their public employment for dictating public policy or interfering with the orderly processes of Government. There is one federation—"One Big Union"—formed to promote the welfare of its members, to which they in common with all other American citizens owe allegiance. All organizations within the jurisdiction of this union must be subordinate to it and obligated to support it—the Government. No organization of class or creed can be invoked to coerce the Government without taking on a taint of disloyalty.

The obligation of the Government and of all its representatives, officials, and employees is to guard and promote the public welfare. An organization sanctioning the strike and boycott for the enforce-

ment of its demands is devoted solely to personal and selfish interest. It is manifestly improper that employees of the Government should affiliate themselves with such an organization.

Government employees should be permitted to organize for their social and general welfare, to appear before committees of Congress, and to furnish information concerning the postal service of which they may have knowledge. They should not, however, be permitted to form organizations or to affiliate with an organization designed to interfere with the discipline and administration of the service, to influence the election of persons nominated for public office or to dictate legislation in their own interest and not for the public welfare.

Labor organizations undertake to compel employers to comply with their demands. They regard solely their own economic welfare and not that of the general public, which, on the contrary, they utterly disregard when they employ the strike and boycott under conditions which often bring suffering upon the entire public. Associated in full membership with some of these organizations are certain individuals who openly defy the Government and assail all government, preaching the doctrine of disorder and violence.

No man is qualified for public service who does not realize that his first duty is to the public. The orderly processes of government and the administration of public affairs can not be efficient and effective when duty to the public is not put first.

As I have before urged upon Congress, the affiliation of Government employees with an outside organization which resorts to strike as a means of adjusting grievances is a menace to the welfare of the Republic, resulting in a divided allegiance, that to the organization being more personal and selfish and stronger than that to the Government. This applies to all Government employees, whether State, municipal, or Federal. Such affiliation engenders dissatisfaction, discontent and unrest, and such a resistance to constituted authority as to ultimately result in lowering the efficiency of the public service.

The enforcement of the principle that Government employees should not hold an affiliation incompatible with their obligation to the public service can not be distorted into a reflection upon the efficiency and loyalty of the postal employees, whose devotion to public duty under the trying test of war was conspicuously demonstrated. But the principle is one which can not be prudently disregarded.

Since my report to Congress on this subject, events have still more strongly demonstrated the soundness of the position I then took. The activities of "organizers" in a campaign to draw employees of the Federal Government and of municipalities into affiliation with the American Federation of Labor have made more manifest the danger which attends a failure to recognize that there can be but one allegiance in the Government service.

With the assumption of Government control of the wire systems of the United States a new group of employees, holding a different status from those of the Postal Service, came within the jurisdiction of the department. While the temporary character of the authority over this group did not warrant interference with or objection to their affiliation with any organization they might choose, the Postmaster General announced and enforced the principle that "a strike on their part is not permissible" while in the Government service. No discrimination was permitted, however, between union and non-union employees, and those who resorted or threatened to resort to a strike were required to resume or to continue their employment before the department would treat with them. The report of the Wire Control Board will disclose that this principle was strictly maintained and that the wires were returned to their owners with no strike pending.

In 1895 organizations of postal employees had become so active in attempts to influence legislative and administrative action that Postmaster General William L. Wilson found it necessary to issue an order directing that no postal employee, under penalty of dismissal, should visit Washington for the purpose of influencing legislation before Congress. This order having afforded but temporary relief President Roosevelt on January 21, 1902, issued an Executive order forbidding all officers and employees of the United States to either directly or indirectly, individually, or through associations, solicit an increase in pay, or to influence, or to attempt to influence, in their own interest any other legislation whatever, either before Congress or its committees. The penalty for the violation of this order was dismissal. This afforded relief, but as a result of terrific pressure, the Congress on August 24, 1912, by a rider on an appropriation bill, permitting Government employees to form organizations, in effect nullified this Executive order issued by President Roosevelt. As a result of this legislation many organizations now maintain representatives in Washington for the purpose of influencing legislation and presenting grievances. By distorting and misrepresenting facts, they have encouraged disrespect for administrative officers, disloyalty to the service, and rendered the maintenance of discipline extremely difficult. An attitude of hostility has been assumed by them for years, irrespective of how or by whom the service has been administered. In calling the attention of Congress to this matter in my report of 1917, I cited the fact that civil-service employees are selected through competitive examination without regard to politics or religious faith, their appointment and promotion being determined by the merit system, and expressed the belief that these employees should have imposed upon them certain limitations as to their activities.

The Postmaster General again repeats that the conduct of these organizations at this time is incompatible with the principles of civil service and with good administration of the Postal Service. They are fast becoming a menace to public welfare and should no longer be tolerated or condoned.

At no time have employees of the Postal Service been denied the privilege of presenting for themselves any complaints or grievances which they might believe demanded consideration. On the contrary, they have been invited to make known their views or any suggestion for the betterment of their condition and the improvement of the service, and have been repeatedly given assurance of fair and just treatment.

The question involved is whether the orderly processes of Government shall be ignored, whether labor organizations can defy its authority and put into effect their will regardless of the rights of others and of the public interest. The Government undertakes to see that even-handed justice is meted out to all. To yield to outside agencies in the exercise of governmental authority to decide what action shall be taken is to confess that the Government has failed and can not be relied upon to do what is right. Such a confession would be indefensible.

The progress of events during the past two years have but served to emphasize that the arguments advanced in 1917 in regard to these organizations were sound, and the position of the department then was well founded as it is now. Accordingly attention is again directed to this subject, and the recommendation in the annual report for the fiscal year 1917 for the repeal of the provision in the act of August 24, 1912, is earnestly renewed.

APPOINTMENT OF POSTMASTERS.

The success of measures devised for the improvement of the service depends very largely on the loyalty and efficiency of the postmasters. The appointment of these officers has been regarded, therefore, as of paramount importance. At the outset of the administration the Postmaster General laid down the requirement that all incumbents and appointees must devote their time and personal attention to their official duties. This requirement has been strictly adhered to and great care taken to examine into the qualifications of all persons proposed for nomination by the President.

The magnitude and multiplicity of the business operations of the postal establishment and the perfect service which the people expect and to which they are entitled, require that not only the greatest care be exercised in the selection of postmasters but that their tenure of office shall depend entirely upon efficient and meritorious service. Such efficient service can best be rendered by men of executive

ability, training, and experience. This makes it essential that persons selected for important positions be chosen because of their fitness and retained only when they render satisfactory service to enable the department to obtain the benefit of such a policy. The Postmaster General has heretofore earnestly recommended that the necessary legislation be enacted to include in the classified service the position of postmaster at Presidential offices. The civil-service rules would then be applicable to the appointment and retention of these postmasters. A provision in law in line with this recommendation passed one branch of the Congress but failed of passage by the other branch.

To afford some relief, the President on March 31, 1917, issued an Executive order requiring that when a vacancy occurs in the position of postmaster of any office of the first, second, or third class as the result of death, resignation, removal, or when on the recommendation of the Postmaster General that the efficiency or needs of the service requires that a change shall be made, the Civil Service Commission shall hold an open competitive examination to test the fitness of applicants to fill such vacancy; and when such examination has been held and the papers in connection therewith rated the commission shall certify the result to the Postmaster General, who shall submit to the President the name of the highest qualified eligible for appointment to fill such vacancy, unless it is established that the character or residence of such applicant disqualifies him for such appointment. It is also provided in said Executive order that no person who has passed his sixty-fifth birthday shall be given the examination therein provided.

The number of appointments of postmasters at presidential offices during the past six years is as follows: 1913, 1,528; 1914, 3,720; 1915, 2,630; 1916, 2,693; 1917, 1,753; and 1918, 2,079.

Under the Executive order referred to during the past fiscal year 3,008 appointments and reappointments were made at offices of the presidential grade. Examinations for these offices are divided into two groups, those at offices where the compensation is from \$1,000 to \$2,400 per annum, and those where it is in excess of \$2,400 per annum. For appointment at offices in the first group candidates are examined on arithmetic and accounts, penmanship, letter writing, and business training and experience. At offices where the compensation is in excess of \$2,400 per annum, personal investigation is made of each candidate by representatives of the Civil Service Commission, one of whom is selected by the commission from the Post Office Department, and these representatives make report of their investigation direct to the commission. In all cases acted upon during the year the first eligible was appointed except where it was clearly shown that this eligible was disqualified under the terms of

the Executive order. Since the issuance of the order a total of 7,483 nominations has been submitted; 6,195 of these or 82.78 per cent have been reappointments. In 1,188 cases not reappointments the first eligible was appointed and in 79 cases only was other than the first eligible selected, and in these cases the failure to appoint the highest eligible was due to his death or refusal to accept the office; or the condition of his health, such as tuberculosis, skin disease, or other physical defects; or because he was disqualified on the ground of character or residence.

This order is the most progressive step toward increased efficiency and businesslike administration in the Postal Service, and although it affords much relief it does not meet the situation fully. It requires that the persons selected for appointment be chosen by open competitive examination and investigation by the Civil Service Commission, but does not affect in any way the tenure of office, and the reappointment of postmasters at the expiration of their terms is still necessary under the law. The provisions of the order have been followed strictly and the wisdom and procedure thereunder have been amply demonstrated in the cases which have been before the department.

However, the department has gone as far as possible in placing these appointments on the merit basis, and it now remains for the Congress to enact legislation extending the civil-service law to include the position of postmaster at offices of the presidential classes, and the previous recommendations of the Postmaster General to that effect are earnestly renewed.

Fourth-class offices are included in the classified civil service and new appointments to these offices are made either from eligible registers furnished by the Civil Service Commission after examination or, in the smaller offices, upon recommendation of post office inspectors. The highest eligible has always been selected for appointment unless it appeared from the records that the appointment of such eligible would not be in the interest of the service. There were 7,083 appointments of this class during the year.

The Executive order of November 30, 1908, extended the scope of the civil service law to all fourth-class postmasterships in the States north of the Ohio and east of the Mississippi, and accorded classified civil-service status to the incumbents of those positions. The same action was taken, by the Executive order of October 15, 1912, with respect to all other fourth-class postmasterships, excepting only those in Alaska, Guam, Hawaii, Porto Rico, and Samoa. In this manner a large number of persons were classified as postmasters at offices of the fourth class, without having been required to submit to any test whatever of capacity or fitness for the positions held by

them. Accordingly, on May 7, 1913, an Executive order was issued, reading in part as follows:

No person occupying the position of postmaster of the fourth-class shall be given a competitive classified status under the provisions of said orders unless he has been appointed as a result of open competitive examination, or under the regulations of November 25, 1912, or of January 20, 1909, or until he is so appointed.

It was found that approximately 5,000 fourth-class postmasters had been appointed to vacancies as a result of open competitive examinations under the civil-service regulations referred to, and at no time has question been raised as to the classified status of these persons.

All other postmasters of the fourth class have been required to submit to tests of their capacity and fitness in open competitive examinations conducted under the authority of the Civil Service Commission and in accordance with the President's order of May 7, 1913. This work which was undertaken in 1913 was continued and completed in the fiscal year 1916. Postmasters of the fourth class now in office have been appointed under procedure in strict accordance with the spirit and letter of the civil service law.

In accordance with the usual practice of the Civil Service Commission, the department has been furnished, for these appointments, with the names of the three eligibles standing highest on the list. The appointing officer has the right, without question, to select any one of the three eligibles certified. In accordance with the purpose of the President when he issued the Executive order of May 7, 1913, the Postmaster General decided, in the interest of efficiency and the promotion of genuine civil-service principles, to give preference to the eligibles in the order of their civil service ratings. To this end the following instructions were issued by him:

In selecting persons from the eligible registers furnished by the Civil Service Commission for appointment as postmasters of the fourth class, it is my desire that the persons with the highest rating be chosen, unless good and valid reasons are submitted to the department showing that this would not be in the best interest of the service. If reasons are submitted sufficient to make the selection of the first eligible inadvisable, then it is my desire that the person with the next highest rating be chosen, unless good and valid reasons are submitted to show the inadvisability of his appointment. In such case the third eligible may be selected. In no case should the second or third eligible be chosen unless the appointment of one of the highest standing eligibles has been shown to be inadvisable from the standpoint of the greatest efficiency in the Postal Service. In reaching conclusions as to the most desirable appointments an endeavor should be made to select persons whose business and temperamental equipment is likely to reflect credit on the Postal Service.

These instructions have been scrupulously adhered to.

Of the postmasters classified by Executive order of October 15, 1912, 66 per cent were retained as the result of the civil-service test

imposed on them. The places of the 34 per cent remaining have been given candidates who have demonstrated their superior fitness and capacity, 30.4 per cent were given to the first eligibles, 2.7 per cent to the second eligibles, and 0.9 per cent to the third eligibles.

The work of appointment and classifying all postmasters of the fourth class under the order of May 7, 1913, is now completed and it may be said that no such appointment has been made except after a test, under civil-service procedure, of the qualifications and efficiency of all applicants for the position.

Consistently with the practice of appointing postmasters of the fourth class with an eye solely to the efficiency of the service, as well as with the recommendation that postmasters at the larger post offices be appointed under civil-service procedure, classified postmasters at post offices advanced from the fourth class to the presidential grade have been retained in office, provided their services have been satisfactory to the department and to the patrons.

SALARIES OF POSTMASTERS.

The act approved March 3, 1883, as subsequently amended, provided that the salaries of postmasters of the first, second, and third classes should be readjusted annually, effective at the beginning of the fiscal year, on the basis of the gross receipts for the calendar year preceding. Effective November 2, 1917, as a war revenue measure Congress established a 3-cent rate on letter mail and a 2-cent rate on postal and post cards, concomitant with which it was stipulated that from July 1, 1917, there should be no increase during the war in the salaries of postmasters at offices of the first, second, and third classes. The administration of this law no doubt imposed hardship upon some postmasters, particularly those of third-class offices, whose salaries range from \$1,000 to \$1,900 per annum.

During this period of stationary salaries the cost of living not only increased but the working forces were depleted through the military draft and more attractive remuneration offered in other lines of employment. Competent clerical assistance was difficult to obtain in some localities and when obtained was at greatly increased cost. Coupled with these handicaps the labors of postmasters were largely increased by the many additional duties imposed upon them, including the sale of war savings, thrift, and revenue stamps, registration of alien enemies, recruiting for the Army and Navy, Liberty loan publicity, Red Cross work, and other war activities. Notwithstanding these conditions the loyalty and faithfulness of postmasters remained unshaken, but few complaints were received, and all evinced an unusual spirit of sacrifice and cooperation.

As the former postal rates were restored and the restrictions in regard to salary increases removed, effective July 1, 1919, it was than

within the power of the department on that date to increase the salaries of many postmasters. The total annual increase amounted to \$1,050,900, of which \$284,400 went to first-class offices, \$661,000 to second class, and \$105,500 to third class.

SALARY AND STATUS OF EMPLOYEES IN POST OFFICES.

The average salary of clerks increased from \$1,052.97 in 1913 to \$1,318.03 in 1919, and city carriers from \$1,087.57 to \$1,305.02.

For the fiscal year 1913 the percentage promotions were first provided for, 75 per cent from \$1,100 to \$1,200 in first-class post offices and 75 per cent from \$1,000 to \$1,100 in second-class offices.

For the fiscal year 1914 the first grade of clerks and carriers was abolished, appointments after June 30, 1913, being made at the second grade, \$800.

For the fiscal year 1917 the following percentage promotions were provided: Clerks, at first-class offices, 75 per cent from \$1,100 to \$1,200, 5 per cent from \$1,200 to special clerks at \$1,300, and 5 per cent of the special clerks at \$1,300 to special clerks at \$1,400; and at second-class offices, 75 per cent from \$1,000 to \$1,100 and 5 per cent from \$1,100 to \$1,200.

For the fiscal year 1918 percentage promotions were provided as for the year 1917, with the exception that the percentages were 85 and 15 instead of 75 and 5.

The act of March 3, 1917, provided increased compensation at the rate of 10 per cent effective during the fiscal year 1918 for classified employees appointed after that date at salaries of \$800, \$900, and \$1,000. On July 1, 1918, every postal clerk and city letter carrier received a \$200 increase in their compensation and on July 1, 1919, every such employee, whose services were satisfactory after a year's service in the former grade, was promoted an additional \$100 effective July 1, 1919. Increased compensation was also provided other employees at the rate of 15 per cent to those who received a salary of from \$900 to \$1,500, 10 per cent to those who received a salary of from \$1,500 to \$2,200, and 5 per cent to those who received a salary above \$2,200. The Comptroller of the Treasury ruled that the minimum salary of a supervisory employee at first-class offices, as well as that of the assistant postmaster of a first-class office, was \$1,800, and also that the minimum compensation of an assistant postmaster at a second-class office was \$200 more than the highest grade clerk or city carrier connected with that office. This has resulted in a great number of promotions in the supervisory employees' compensation as well as that of assistant postmasters.

At the present time legislation is pending giving a further bonus to employees in the Postal Service covering the current fiscal year as follows: Clerks and city carriers in the \$1,000 grade, \$240; those in

the \$1,100 and \$1,200 grades, \$200; those in the \$1,300, \$1,400, \$1,500 and \$1,600, \$150; those receiving a compensation of \$1,700, but not more than \$2,500, \$100; printers, mechanics, and skilled laborers who receive a compensation of \$1,150 to be increased \$150, \$1,265, to be increased \$135, \$1,380, to be increased \$70; watchmen, messengers, and laborers who receive a compensation of \$1,035 to be increased \$205. Provision is also made for the employment of substitutes at the rate of 60 cents an hour instead of 40 cents as at present. The above bonuses, however, will not apply to employees who have received \$300 or more increased compensation during the current fiscal year.

If this increase should be granted by the Congress, the opinion is here expressed that the department will at once be placed on a deficiency basis, unless there should be an unlooked for increase in the postal revenues. These proposed increases absorb for the benefit of postal employees the entire increase in revenue for this fiscal year as well as all savings and economies which have been effected within the past seven years and deny to the users of the mails any participation therein. The necessities of the service do not require this and it is manifestly unjust. Requirements for efficient mail service and not expediency should be the sole guide in determining action in a matter of this kind.

PERSONNEL IN OFFICES OF FIRST AND SECOND CLASSES.

During the fiscal year ended June 30, 1919, the appointment of 2,476 additional clerks was authorized for first and second class post offices, and the average salary increased from \$1,157.39 in 1918 to \$1,318.03 in 1919. During the six fiscal years ended June 30, 1916, the average number of resignations and removals of post-office clerks amounted to 4.43 per cent of the entire force; during the fiscal year 1917, which covered the first three months of this country's participation in the war, the separations from the service amounted to 5.45 per cent of the entire force; while during the fiscal year ended June 30, 1918, 12.4 per cent of the force were separated. For the last fiscal year the records show 4,961 clerks resigned and 441 removed, representing 12.08 per cent of the total force, thus showing that the number of resignations is decreasing. In my last annual report attention was called to the fact that during the fiscal year ended June 30, 1918, 3,781 clerks entered the military or naval service of the United States and were granted leaves of absence without pay. The records show that during the past fiscal year, embracing only a little more than the last four months of actual fighting, 1,728 additional clerks were granted indefinite leaves of absence without pay because of entry into the military service. A great many of the military camps have been discontinued and

others greatly reduced, with result that a large proportion of the experienced postal clerks detailed to branch post offices, which had to be established at these camps, have been returned to their home offices. Out of the total number of clerical employees who have been granted indefinite leaves of absence without pay because of entry into the military or naval service, 3,546 have been reassigned to their former positions without loss of grade or rating and, in cases where they returned to duty in time to make it possible to do so, they have been granted their vacations on the same basis as if their services in the post office had been continuous.

The records of the department show that during the fiscal year ended June 30, 1919, 1,206 carriers were granted indefinite leave of absence without pay on account of entry into the military service. The total number of city carriers who have been granted leave of absence without pay on account of entry into military service is 2,903, and out of this total 1,773 have been reassigned to their former positions without loss of grade or rating, and, in cases where they returned to duty in time to make it possible to do so, they have been granted their vacations on the same basis as if their services in the post office had been continuous.

Heretofore, appointments to the position of laborer with a classified status have been made only in 37 of the larger first-class offices where appointments to these positions were made by selection from the skilled laborer register. Under date of January 14, 1919, the department requested the Civil Service Commission to extend the application of the labor regulations to an additional list of 31 offices. The commission concurred in this request and provided that thereafter appointments to the position of laborer in these offices should be made by selection from the skilled laborer register of eligibles who had passed a designated strength test. The department has recently requested the Civil Service Commission to give favorable consideration to the question of extending the application of the labor regulations to all post offices of the first and second classes in order that all appointments to these positions may hereafter be made by the selection of persons having a classified status, except in the case of temporary appointments made in an emergency during the absence of an eligible register.

In order that the granting of vacations with pay might be uniform in the cases of all employees in first and second class post offices and with a view to eliminating the apparent discrimination heretofore existing in this matter in favor of the city carriers as against the clerical employees of the office, Congress upon recommendation of the Department placed in the Post Office appropriation act for the fiscal year 1920 a proviso that hereafter the 15 days annual vacation allowed by law to clerks and other employees in

first and second class post offices should be credited at the rate of one and one quarter days for each month of actual service, doing away with the former requirement that these employees should not be granted any vacation with pay until they have completed a year's service.

With a view to eliminating as far as might be possible excess overtime on the part of clerks in post offices, Congress has provided that hereafter whenever practicable in case of emergency or otherwise a substitute is available the postmaster is prohibited from employing a regular clerk overtime.

No action is taken looking to the reduction of classified employees in post offices of the first and second classes except in accordance with the provisions of section 29, Postal Laws and Regulations, which require that charges specific in character shall be preferred in writing and the employee afforded an opportunity in which to submit his written defense. The papers are then forwarded to the department for review and decision. Final action is not taken until after careful review and analysis of the evidence in connection with which the employee's answer is accorded the most careful consideration.

INCREASED SALARIES OF EMPLOYEES IN POST OFFICES.

For the fiscal year 1919 Congress provided a temporary reclassification of salaries for clerks and city letter carriers, dividing them into six grades, from \$1,000 to \$1,500, inclusive, with provision that they should be promoted successively through the grades until they reached the sixth grade, salary \$1,500, each promotion to be made at the beginning of the quarter following the completion of a year's satisfactory service in the next lower grade. This temporary reclassification has been continued for the fiscal year 1920, thus providing a promotion of \$100 during this fiscal year for all clerks and city carriers in first and second class post offices who have completed a year's satisfactory service in their present grades. Congress also enacted a provision of law which, as construed by the Comptroller of the Treasury, fixes the minimum compensation of the supervisory officials in first-class post offices at \$1,800. Under this law many supervisors' salaries were increased \$400. This legislation also fixed the minimum compensation of assistant postmasters of first-class post offices \$1,800 and the minimum compensation for assistant postmasters of second-class post offices \$200 in excess of that paid the highest grade clerk or city carrier in such office.

The department has long felt the need for a reclassification of the positions and salaries of employees in post offices, more particularly in the supervisory grades in first class offices, and in this connection attention is invited to recommendations contained in the Postmaster

General's annual report for the fiscal years 1914, 1915, and 1916. In section 3 of the act making appropriation for the service of the Post Office Department for the fiscal year ended June 30, 1920, and for other purposes, the Congress has provided for a commission consisting of five members of the Committee on Post Offices and Post Roads of the United States Senate and five members of the same committee of the House of Representatives to investigate the salaries of postmasters and employees of the Postal Service with a view to the reclassification and readjustment of such salaries on an equitable basis. It is the hope of the department that this investigation will be most thorough and that as a result of their labors an equitable adjustment of the salaries of all postal employees will be made. It is recommended that any reclassifications made in the salaries of postal employees of a permanent nature shall be based upon normal conditions. It is especially recommended that all unnecessary designations of supervisory employees be discontinued and that a maximum compensation for supervisory officials and a maximum number of positions in each grade be definitely fixed in accordance with the class of the office, based upon its gross postal receipts. The compensation of the senior supervisory employees in the larger post offices should be such as to secure to the Postal Service the most competent men.

While the department has experienced trouble at a few post offices in securing and retaining competent employees it is believed, after careful inquiry, that the mutations in the service have not been greater than are experienced by private industries employing a similar grade of help. At a few of the industrial centers where the man power is below the requirements of industrial activities a spirit of restlessness and a desire for change pervade the labor market. This has been felt in the postal service as well as in manufacturing and commercial enterprises. The requirement that post office employees pass a civil-service examination and attain a certain percentage in both mental and physical capabilities militates against the department in readily securing young men and adequate and proper force and increased compensation will not entirely overcome this handicap or remove the difficulties in securing this character of help in competition with private concerns that employ men and women without competitive examinations.

SUBSTITUTE AND AUXILIARY EMPLOYEES, COMPENSATORY TIME, 8-IN-10-HOUR LAW, AND OVERTIME.

The act making appropriations for the service of the Post Office Department for the fiscal year 1908, provided that auxiliary clerks and carriers should thereafter be paid at the rate of 30 cents an hour (they had previously been paid at the rate of 25 cents an hour), that

they should be required to work not less than two hours a day, and might serve as substitutes.

The 1914 Post Office appropriation act provided that substitutes employed in place of regular clerks and carriers absent without pay should be paid at the rate of 40 cents an hour, and that substitute clerks and carriers otherwise employed should be paid at the rate of 30 cents an hour.

The 1915 Post Office appropriation act contains the following:

Provided, That after June 30, 1914, the pay of substitute letter carriers employed in the places of regular employees absent from duty with pay and of auxiliary and temporary carriers employed at offices where the City Free Delivery Service is already established or may hereafter be established, and of substitute clerks employed in the places of regular employees absent from duty with pay, and of auxiliary and temporary clerks employed in first and second class post offices, shall be at the rate of 35 cents an hour.

In the Post Office appropriation act for the fiscal year 1917, it is reiterated that substitutes for clerks in first and second class post offices and carriers in the City Delivery Service, absent without pay, shall be paid at the rate of 40 cents an hour, and that substitutes employed in the places of regular clerks and city carriers absent with pay, or on temporary service of any kind, should be paid at the rate of 35 cents an hour.

The Post Office appropriation act for the fiscal year 1919 provides that substitute clerks and city carriers, regardless of the nature of the service performed, shall be paid at the rate of 40 cents an hour for such service.

The following provision is contained in the act approved March 4, 1911:

That hereafter for services required on Sundays of supervisory officers, clerks in first and second class post offices, and city letter carriers, compensatory time off during working days in amount equal to that of the Sunday employment may be allowed under such regulations as the Postmaster General may prescribe; but this provision shall not apply to auxiliary or substitute employees.

Beginning with the fiscal year 1917, special clerks are granted compensatory time for Sunday service in the same manner as regular clerks and carriers.

Beginning with the fiscal year 1917, clerks and carriers shall be granted compensatory time for holiday service on one of the 30 days following.

Beginning with the fiscal year 1918, special clerks are entitled to compensatory time for holiday service in the same manner as regular clerks and carriers.

Beginning with the fiscal year 1918, foremen, watchmen, messengers and laborers are entitled to compensatory time for Sunday and holiday service in the same manner as regular clerks and carriers.

The Post Office appropriation act for the fiscal year 1919 provides that—

Hereafter when any employee is entitled under the law to compensatory time for Sunday or holiday service he may, if he so elects, be paid for overtime in lieu thereof.

In the act approved May 24, 1888, the following provision appears:

That hereafter eight hours shall constitute a day's work for letter carriers in cities or postal districts connected therewith, for which they shall receive the same pay as is now paid for a day's work of a greater number of hours. If any letter carrier is employed a greater number of hours per day than eight, he shall be paid extra for the same in proportion to the salary now fixed by law.

In the act approved June 2, 1900, provision is made that letter carriers shall be required to work as nearly as practicable only 8 hours each day, but in any event not exceeding 48 hours during the 6 working days of the week, and such number of hours on Sunday, not exceeding 8, as may be required, service on Sunday to be counted as full day whether actually employed eight hours or less. If legal holiday occurs on working day, and service is performed on said day, if less than eight hours, it shall be counted as eight hours without regard to the time actually employed.

The act approved August 24, 1912, contains the 8-in-10 hour law, effective from March 4, 1913; provision is made for pro rata pay for all overtime for clerks and carriers; compensatory time to be granted for Sunday work on one of the days of the following week.

The Post Office appropriation act for the fiscal year 1917 extends the 8-in-10 hour law to special clerks.

The Post Office appropriation act for the fiscal year 1919 provides that:

Hereafter when any employee is entitled under the law to compensatory time for Sunday or holiday service he may, if he so elects, be paid for overtime in lieu thereof.

Section 3 of the 1919 appropriation act extends the 8-in-10 hour law to watchmen, messengers, and laborers, with pay for overtime.

From the foregoing legislation it will be seen that during this period of many perplexities increases in salaries and improved working conditions of postal employees have been provided from year to year.

RETIREMENT.

The department has gone on record many times urging Congress to provide some retirement measure for superannuated employees in the Postal Service. To dismiss these employees who have been faithful because they have become inefficient on account of increas-

ing age is very hard, yet to continue them in office to the detriment of the service can not be justified under the law. It is hoped that some legislation of this character will be enacted before the end of the present Congress.

UNUSUAL CONDITIONS AT POST OFFICES.

The act of July 2, 1918, fixed the initial salary of clerks and carriers at \$1,000 per annum and provided for automatic promotions of \$100 per annum up to and including \$1,500, the maximum grade. In different sections of the country, notably the oil and mining regions of the West and Southwest and in Alaska, it is at times impossible to procure clerks and carriers at the regular entrance salary or to retain such employees at the salaries permissible under the law. To meet these unusual conditions the department has recourse to the appropriation for unusual conditions. Several cases in point now exist at a number of towns within the Texas oil belt, notably Ranger, where the cost of living is abnormally high and ordinary laborers are paid at rates ranging from \$6 to \$10 a day. When this office was advanced to the second class, July 1, 1919, it became necessary to employ clerks out of the appropriation for unusual conditions and this course has been followed at several offices in other Texas oil fields. Due to the numerous unusual conditions with which the service has had to deal during recent years, the necessity for expenditures from that appropriation has gradually increased. The amount appropriated for the fiscal year 1919 was \$275,000, and while only \$200,000 was appropriated for the fiscal year 1920, it now appears probable that it will be necessary to request a deficiency before the end of the year.

CLERK HIRE AT THIRD-CLASS OFFICES.

Considerable difficulty was experienced in maintaining adequate clerical assistance at third-class offices, due to the fact that we were operating under a statute passed in 1912 which restricted the maximum clerk hire allowable to those offices on a scale ranging from \$300 for offices of the \$1,000, \$1,100, and \$1,200 grades to \$800 at offices of the \$1,800 and \$1,900 grade. This maximum was in normal times sufficient in almost all cases to secure necessary assistance, but during the war when the supply of labor was so greatly reduced and its cost advanced proportionately it was practically impossible for postmasters of third-class offices to procure competent clerical assistance for the maximum amounts that could be authorized by the department. In numerous cases clerks who were not inducted into the military or naval service resigned to accept more remunerative positions. The resultant impairment of the service at these offices

employing only one or at the most two clerks was relatively far greater than at the larger offices. Many appeals for relief were received and these were responded to as far as possible, but the legal limitation as to the maximum amounts allowable so restricted the department's latitude as to work hardships upon some officers where labor conditions were abnormal.

In accordance with recommendations of the department, this condition was remedied in the appropriation act for the fiscal year 1920, the maximum allowance for each group of offices being increased 50 per cent. the scale ranging from \$450 to \$1,200, according to the size of the office. After conditions shall have become normal the maximum allowance will probably not be necessary in all instances. The department will thus be vested with a greater degree of discretionary power and enabled to authorize such amounts as may be actually necessary to provide sufficient assistance at third-class offices where an unusual amount of clerical work is involved.

GUARANTY FUND IN LIEU OF BONDS.

Postmasters and postal employees are required by law to furnish bonds in sufficient amount to protect the Government against losses due to embezzlements or other derelictions by such postmasters and post-office employees. In some instances the bonds are given by personal sureties, but it is the general practice to procure bonds from commercial bonding companies on the payment of annual premiums. Each bond is in a fixed amount, and as loss in excess of that specified in the bond can not be collected from the surety, the protection to the department is not adequate, and the securing, filing, verifying, and approving of the bonds as well as the examination every two years into their sufficiency and the responsibility of the sureties as required by law, entail a vast amount of administrative expense. There is objection to this system of bonding on account of the excessive premiums collected and the labor and annoyance incident to yearly renewals.

It is believed that authority of law should be granted the Postmaster General for the establishment and maintenance of a guaranty fund by assessments against the salaries of those officers and employees who are now required to furnish bonds. Such a fund would provide reimbursement to the Government for the entire amount of every loss regardless of the amount of the individual bond, and the assessment levied against the salaries of officers and employees would be much less than the premiums now paid. Under this plan the amounts of the bonds required of the several classes of employees and postmasters may be equalized so that each will pay an amount in proportion to the opportunity for embezzlement. It will be entirely safe to do this under the guaranty fund plan for the reason

that the entire amount of the fund will be available for the reimbursement of the Government in the case of every loss.

In the interest of both the Government and the employees previous recommendations for the adoption of a mutual bonding plan are earnestly renewed.

RURAL MAIL SERVICE.

Since 1914 rural mail service has been extended to 5,868,000 patrons who were before that time without adequate mail facilities. This was accomplished at an additional annual expense for the establishment of service of \$500,000, provided for in the 1914 appropriations, which has not since been increased. The appropriations for compensation of employees engaged in the collection and delivery of mail on routes of the entire rural service have increased from \$47,000,000 to \$68,000,000. The number of pieces of mail handled annually has increased from 3,093,350,334 in 1913 to 3,870,068,064 in 1919, or an increase of 776,717,730 pieces. Since 1914 there have been also established 833 routes, known as motor rural routes, of 50 miles or greater in length, where the use of motor vehicle, with reasonable regularity throughout the year, is assured.

On March 4, 1913, over 2,600 petitions for the establishment and extension of rural routes had been pending for several years in the department. Before July 1, 1913, this number had been reduced to 834, and to-day the total number of petitions for establishment or extension of service pending in this department does not exceed 368, and not one of them has been here a period of one year.

In 1913 the cost of Rural Delivery Service per person was \$1.97, and, notwithstanding the increase of \$20,000,000 in compensation to carriers employed in this service, or approximately 50 per cent, the cost per patron had been reduced to \$1.913 in 1918.

The transportation of mail in bulk from general supply stations located on rail or water transportation routes to points in the interior has vastly increased in the last six years, and new methods of operation were necessary to accommodate the great quantity of parcel post matter presented for conveyance. At Vernal, Utah, a bank building was wholly constructed from materials transported by parcel post. Everywhere in the far West great quantities of matter were presented for mailing because the postal means of transportation alone were available in the development of these vast areas. Consequently the department adopted the plan for the carriage of first and second class mail and perishable parcel post at a flat rate per annum on a fast schedule and the conveyance of third-class and ordinary parcel post mail on a slower schedule at pound rates. Through means of advertising for bids under this plan, the department was able to secure reasonable proposals for the service required, and effected a saving of \$500,000 during the fiscal year 1915 for the Government.

During the fiscal year ending June 30, 1919, rural service was extended to approximately 1,492,280 persons who theretofore had been without such mail facilities. This additional service was furnished with 243 less routes than were in operation June 30, 1918. This reduction in number of routes was brought about by continuing the systematic alignment of routes and elimination of unnecessary duplication of travel. On June 30, 1919, there were 29,282,739 persons, or 6,365,813 families, served by rural carriers at a cost of \$66,031,487 as compared with 27,790,459 persons, or 6,041,404 families, on the same date of the previous year, at an expenditure of \$53,166,502. This increased cost of the rural service over the year 1918 was due almost entirely to additional compensation granted rural carriers. The average cost per rural patron was on June 30, 1919, \$2.255, while on June 30, 1918, it was \$1.913, a unit increase of \$0.342. The number of pieces of mail handled was 3,686,991,928 at a unit cost of \$0.018 per piece, an increase of \$0.0047 per piece.

On June 30, 1919, 43,210 routes were in operation covering 1,143,467 miles and averaging 26.46 miles to the route. It is interesting to note that the total number of routes in 1918 were 43,453, aggregating 1,127,110 miles in length and averaging 25.94 miles to the route. A comparison of the figures for the two years will show that there are fewer routes in operation, but the comparison also shows that considerably more mileage is covered even though the average length of routes is only slightly increased over that for the fiscal year 1918. This is the result of the department's effort to standardize the length of rural routes and to make the work of rural carriers more nearly uniform.

It is believed that the department's accomplishments warrants the granting of administrative discretion in the establishment of rural routes from 36 to 50 miles in length. At present it is impossible, on account of legislative restrictions, to provide routes of that length. The motor vehicle has revolutionized the means of conveyance everywhere, and its value should not be curtailed in its application to problems of transportation in the Postal Service any more than it is in its usefulness in the commercial world.

It was found possible during the year just closed to supersede 47 star routes of a total length of 428 miles with rural mail routes. This vastly improved the service and effected an annual saving of \$30,074.22.

Of the 43,098 rural carriers in the service on June 30, 1919, the average annual pay, including motor-vehicle service, was \$1,470.84. For horse-drawn routes the average pay was \$1,457.28.

Despite the fact that rural service has been extended to 5,886,000 additional patrons since 1914, including 1,492,280 during the past

year, a comparison of the rural population for 1910 with the number of such population having mail service shows there are about 9,718,000 persons, equivalent to approximately 2,100,000 families, without rural mail service. These persons are entitled to this service which could not be supplied under the old system of indiscriminately laying out and establishing rural routes. It is the purpose of the Post Office Department to continue its policy of equitable extension of rural routes until all of these are supplied with mail facilities to which they are justly entitled.

Great progress in the further extension of mail facilities to a large proportion of the rural population not now provided could be accomplished through the improvement of the highways.

It is evident that the successful operation of rural delivery is dependent upon the character of the highway over which it is performed, and therefore this department is deeply concerned in the improvement of the highways, not only because of the economy of operation, but also because it would permit the more rapid extension of mail service to all possible rural patrons. This explains the activity and interest of the department in the improvement of roads. In 1913 there was available in the postal appropriation \$500,000 to be expended in cooperation with the several States for experiments in the construction and improvement of highways. Because of the effective results attained through the application of this small appropriation, and the continued activity and interest of this department, there is to-day available for the next three years the sum of \$200,000,000, which will aid very materially, when a similar sum has been provided by the States for this purpose, in the extension and improvement of new highways, and resultant improved mail facilities to the farmer producer, who may then lessen the difference in amount of parcel-post mail matter delivered into rural territory, which averages six pieces per route per day, as over against one piece per route per day collected from rural territory. Through such improvement of the highways and their use in the transportation of foodstuffs, it would be possible to convey an average of not less than 1,800 pounds per day per route, as compared with 24 pounds at present conveyed. It is only through the efficient use of improved highways that the Postal Service may perform the service to the people in aiding in the substantial reduction of the cost of living.

CHANGES IN PERSONNEL IN RURAL MAIL SERVICE.

During the year 10,429 vacancies occurred in the rural service, of which 8,615 were resignations, 404 caused by deaths, 347 by removals, and 1,063 by inductions into the military service. The increase in resignations was due to abnormal compensation paid for labor in various industrial activities.

STAR ROUTE SERVICE.

During the last few years many contractors for service on star routes have been required to make box delivery and collection service, sell stamps, and provide money-order and registry facilities to patrons domiciled on the roads covered by the routes. These additional facilities have been provided at no substantially increased expense, and have resulted in convenience to thousands of patrons, almost all of whom are remote from other postal conveniences.

The total length of the regular star routes in the United States on June 30, 1919, was 148,467.45 miles. The aggregate mileage traversed annually was 79,972,480.28 miles, at a cost per mile of 12.46 cents. The number of such routes in operation was 10,773, the annual cost of which was \$9,963,916.81. In addition, there were 151 pound-rate routes operated at an approximate cost of \$230,000.

The four-year contracts entered into by the Post Office Department on July 1, 1919, show an increase in the cost per mile of travel of 2.29 cents over the contracts for the same service which expired on June 30, 1919. This increase in the cost for star-route service for the contract section in question was due to the higher cost of equipment and maintenance and increased compensation paid to labor employed by contractors.

Under the act of July 2, 1918, which authorized the Postmaster General to investigate conditions arising from contracts in the star-route service entered into prior to June 30, 1917, with a view to determining whether readjustment should be made in the compensation rendered, allowances amounting to \$393,257.12 were made during the fiscal year on 2,317 star routes.

At the close of business on June 30, 1919, six routes with Government-owned equipment were in operation. These routes were established after it was ascertained that no proposal for the performance of the service under private contract could be had, or after proposals submitted were found to be excessive. The establishment of these routes has demonstrated that it is not only a more economical service, but that schedules can be more closely maintained, and the mail in greater volume can be more carefully and expeditiously handled. This is due to the better equipment, properly maintained, which is used, and to the further fact that more efficient men are employed by the department than by private contractors, who naturally endeavor to provide the service required at the lowest possible cost.

RURAL PARCEL-POST MOTOR-TRUCK SERVICE.

During the year 1917 the department was authorized to advertise for contracts that would require the exclusive use of motor vehicles in the transportation of mail on star routes. This marked a progres-

sive advance in postal activity, for mail is not only delivered earlier than would otherwise be possible to a large number of post offices located on branch railroad lines, but to offices from which rural routes emanate. Thus the mail from many cities is delivered 24 to 48 hours earlier than formerly, with corresponding advantages in the dispatch of outgoing mail.

At the close of the fiscal year ending June 30, 1919, there were in operation three motor vehicle truck routes. Their location, the cost of operation, the weight of mail transported, and the revenue derived is shown as follows:

Termini.	Weight (pounds).				Estimated postage.	Operating expenses.
	First class.	Second and third class.	Fourth class.	Total.		
McConne'lsburg, Gettysburg, Soudersburg, Rising Sun, Philadelphia.....	22, 109	58, 620	981, 783	1, 062, 512	\$48, 265. 81	\$15, 468. 51
Philadelphia, Wilmington, Easton.....	5, 162	21, 083	115, 953	142, 198	9, 834. 67	3, 826. 08
Washington, Gettysburg.....	20, 907	102, 000	310, 710	433, 617	39, 318. 78	10, 974. 57
Total.....	48, 178	181, 703	1, 408, 446	1, 638, 327	97, 419. 26	30, 269. 16

This service has been operated under the provisions of section 7 of the act of July 2, 1918, making appropriations for the conduct of experiments in the motor vehicle truck service. It was designed primarily to promote the conservation of farm products, to facilitate the delivery and collection in rural communities of parcel matter admissible to the mails.

When this service was first utilized, an effort was made to maintain it through connecting trunk-line routes. This policy after fair trial was abandoned as impracticable and its operation has been curtailed and is now confined to given localities.

The advantages of this service to the public seem to justify continuance of the existing routes, and when its benefits are conclusively demonstrated it might be wise to extend it to other sections. It is hoped that ultimately it may be utilized to reduce in some degree the present high cost of living.

Certain modifications of rates in postage and in packing and wrapping requirements have been made which it is anticipated will prove advantageous.

VILLAGE DELIVERY.

A new function known as Village Delivery was authorized in 1913, and at the close of that year 101 post offices had been supplied

with this service. A total of 126 carriers were employed at an average annual compensation of \$625 each. On July 1, 1919, the service was in operation at 570 offices, with 852 carriers employed at an average annual compensation of \$783 each.

EQUIPMENT AND SUPPLIES.

Early in the present administration the Division of Equipment, including the mail bag shops and mail lock shops, was transferred from the Bureau of the Second to that of the Fourth Assistant Postmaster General, and consolidated with the Division of Supplies under the designation of Division of Equipment and Supplies. This was done because it was recognized that the functions of the Division of Equipment included distribution as well as mechanical operations, a character of work similar to that of the receipt and distribution of supplies, performed by the Division of Supplies.

At that time deplorable sanitary conditions, which grew up prior to 1913, prevailed in the workshops. The health authorities had complained for years concerning these conditions.

The mail lock and mail bag repair shops were housed in a building unfitted for mechanical operations. It was the best that could be had in the circumstances, the Government being under contract to continue, at an exorbitant figure—\$32,000 per annum—the rental of the building in which the shops were located. The working conditions were such that the employees engaged in the repair of mail bags were compelled to wear dust-protecting devices, and there was continual complaint of the effect of the filth and dust upon the health of the working force. Such improvement as was possible in a poorly designed structure was promptly made. Cleaning devices were installed, so that every mail container sent to the workroom for repairs had as much of the dirt and dust removed from it as was possible. Ventilators and fans were provided to remove whatever dust and impure air accumulated.

Notwithstanding the improvements that had thus been effected, the maintenance of efficient operation and the continued care and precaution required to prevent disease were rendered so difficult that the department was compelled to call upon the Supervising Architect of the Treasury Department for an estimate of cost for the construction of a modern shop building. This estimate, submitted under date of September 3, 1914, indicated that the proposed building alone would cost in the neighborhood of \$400,000, and that in the regular course of the work of construction of Government buildings under the direction of the Supervising Architect it would be impracticable to even begin "to prepare plans and specifications until after the commencement of the calendar year 1920." Because of the urgent need of the building the Postmaster General sought relief from the

Congress and an appropriation of \$200,000 was asked for and given with which to purchase land and erect a factory building.

The department entered into contract with private contractors for the construction of this building and it was completed in April, 1918, one year and five months after the contract had been let. The cost of the site and the building combined was less than \$200,000 and the building completed and ready for occupancy at least two years earlier than it otherwise would have been. The building is situated on the corner of Fifth and W Streets, NE., a steel and concrete manufacturing establishment, second to none in the city of Washington, fireproof and sanitary, thoroughly lighted and ventilated.

In this building, with employees working two shifts of eight hours each, the Post Office Department is manufacturing and repairing practically all the mail bag and mail lock equipment, as well as many other items of equipment used in the Postal Service. This equipment is being manufactured and repaired at less cost than had been possible through contract with individuals, firms, or corporations, although the department strictly observes the law providing for an eight-hour day, usual holidays, and disability leave, and without the employment of child labor.

Substantial increases in salary have been granted employees in the mail equipment shops. The improved efficiency of the employees and their hearty cooperation has warranted an increase in salaries of from 25 to 50 per cent since 1913, and this, too, without increasing the unit cost of the article repaired. The cost of manufacturing and repairing sacks and pouches during the present year is less than that during 1914.

In 1914 there were 88,184 sacks repaired per month at a unit cost of 7.7 cents, as compared with 232,642 sacks repaired in a single month now at a unit cost of 7.4 cents. While 19,994 pouches were repaired per month in 1914 at an average unit cost of 13.4 cents, such repairs are now being made at a unit cost of 11.2 cents, notwithstanding the fact that on July 1, 1919, not a single employee engaged in such repair work will receive less than \$3 per day. This applies to the employee who has had at least one year's experience on the duties to which such employee may be assigned.

During the year 1918, when the department was unable to secure a reasonable proposal for the manufacture of mail bags, on account of conditions incident to the war, 472,350 No. 1, class A, mail sacks were manufactured in the department mail bag shop at a unit cost of 18.9 cents for labor, material, and all overhead expenses, as compared with the lowest proposal tentatively submitted by a manufacturer for making this style of sack at 33.9 cents, a saving of 15 cents per sack to the Government, aggregating \$70,852.50 on this one small lot of mail containers alone.

With the introduction of parcel post the character of mail matter has been changed. Two or three pieces of mail will fill an ordinary mail container, whereas formerly thousands of pieces of letter mail could be carried in a single mail sack. It is, therefore, obvious that a very large increase in the quantity of mail equipment is necessary. Through the careful selection of lighter canvas it was possible for the department to bring about substantial savings of money, with no loss to the serviceability of the mail-bag equipment. An instance which is typical of this saving was in making 472,350 mail sacks, of light weight canvas, at a cost of \$712,922.97. For the same number of sacks made out of heavy canvas it would have cost the department an additional sum of \$174,769.50.

A great number of mail containers are used only during the holiday season, a period of about six weeks in the months of November and December each year, and not used during the remaining 10½ months of the year. Under such conditions it was evident that a light-weight, medium-priced mail bag would be equally as serviceable as the heavier and more expensive equipment, and acting upon this assumption thousands of dollars have been saved by the utilization of the lighter weight equipment.

During the fiscal year just closed a total of 2,532,632 bags were repaired, as against 1,875,028 for the preceding year, an increase of 657,604. Through the work of the salvage branch it was possible to restore to the service 272,986 sacks salvaged from parts of condemned sacks. In addition, 13,900 old pouches were salvaged by being fitted with new heads. It was found necessary to condemn as entirely unserviceable 279,761 bags as against 74,551 in the previous year.

Quantity production of mail bags has been undertaken for the first time in the Mail Equipment Shops, and all expectations have been met. A total of 925,983 new mail containers were supplied the service during the year, consisting of 877,656 sacks and 48,327 pouches. Of this total, 472,350 of the sacks were manufactured in the equipment shops, not only within the required time but at a cost of \$80,000 under the lowest bid received from commercial concerns. The shops also manufactured and supplied the necessary cord fasteners, grommets, and other metal attachments for the bags referred to. In addition, 10,368 pieces of equipment and attachments were produced for other executive departments and the postal establishment of the Philippine Islands.

In order to handle the increased routine work and the manufacture of new equipment in the shops the personnel was practically doubled and a night shift inaugurated, which will be retained as long as the needs of the service warrant it.

New machines have been installed in the lock shop and constant attention is given to improved methods of operation. An automatic die for bending cord fastener and label case bottoms has been installed, which turns out 30,000 to 40,000 pieces per day, as against from 12,000 to 16,000 under the method heretofore in use. There has been adopted a new method of punching mail sacks for grommets, whereby all of the holes are punched at one operation instead of individually, with the result that an expert operator using this method turns out eight times the work formerly done in a given period. An automatic die for making grommet rings at one operation has been installed which enables one pressman to do the work of two, and in addition releases one press for other uses. A new design of two-piece grommet in lieu of the three-piece formerly used results in a considerable saving of material.

To provide greater security in the transportation of mail matter, a lock cord fastener is now being experimented with which will still further reduce the cost of the construction of cord fasteners and provide greater safety to the mail matter within the container to which they are attached.

Nearly 1,000,000 mail locks, lighter in weight, smaller in size, and far more efficient in service, have been designed and placed in use. Where formerly possibly more than 40,000 locks were returned annually, less than 2,000 now appear.

The cost of repairs has been reduced to a nominal figure, while the cost of manufacture of each lock has been reduced from 18 cents to less than 8 cents.

When this administration assumed control of the postal establishment the Postal Service was using approximately 2,400 canceling machines, which were designed to impress a date and cancel the postage stamps attached to mailable matter. Of this number 1,960 were rented from two or three manufacturers who held patents upon various parts of the machines, and the rental amounted to \$300,000 per annum. Proposals were submitted to the owners of these devices to purchase them, and prices for the highest grade product, ranging from \$575 to \$1,100 were received. Upon the expiration of the agreements for the lease or rental of the machines the appropriation provided for such lease or rental was used for the purchase of the machines, and to-day there is not a canceling machine in the Postal Service leased or rented.

With this money the department is now extending the introduction of these devices to hundreds of offices that have heretofore been compelled to use the slow and inefficient hand-canceling method. It is anticipated that in the near future every post office above that of fourth class will be provided with a mechanical canceling device that will improve the efficiency of operation in such offices, and that

this service will be operated at an aggregate expense not to exceed \$100,000 per year.

In the Division of Equipment and Supplies many new mechanical and labor-saving devices have been improved and perfected. Patrons of the Rural Delivery Service have expended in the neighborhood of \$50,000,000 for letter boxes, and realizing that many of these devices were sold and distributed at exorbitant prices, the department designed a uniform type, and those that are now distributed to the rural patrons are all subject to the approval of the department, such approval including, in addition to the material used, the cost or price at which it is sold to the public. Thus, the department endeavors to protect the patron in the quality of the letter box purchased and in the reasonable cost to him.

The repair of scales has been resumed in the shops and it has been found possible to place 8-ounce scales in serviceable condition at a unit cost of \$0.81 as against \$3, the cost of a new scale.

The carpenter shop has been provided with additional machines and turned out 492 distributing cases and other equipment during the year at prices materially under those of outside bidders.

Only by the transfer of unused postal equipment and supplies and the adoption of methods heretofore found unnecessary in their distribution was the Division of Equipment and Supplies enabled to overcome during the war the embarrassment caused by the failure of some of the contractors to make prompt deliveries. Considerable difficulty was experienced in meeting the needs of the Postal Service for official and registry envelopes. This was due not only to the failure of the contractor who supplied this particular item, because of war and labor troubles, to fulfill his obligations, but also to the fact that the requirements of the service for envelopes were greater during the war than during normal times.

Because of the abnormal demands made upon the Postal Service, growing out of the war, a largely increased amount of equipment came into the Mail Equipment Shops for repair. This was occasioned by the fact that practically every piece of postal equipment is now constantly in active service, whereas in prior years there were slack periods when considerable part of such equipment was stored in depositories.

During the fiscal year just ended the Postal Service consumed 70 carloads or about 2,100,000 pounds of twine. It is interesting to note that in the fiscal year 1910 the Postal Service used 84 carloads or about 2,520,000 pounds of twine, notwithstanding that at that time the amount of mailable matter was not half as great as it is at the present time. This net reduction of nearly one-half million pounds of twine per annum followed an intensive campaign to im-

press upon postal employees the necessity for careful saving and re-use of every pound thereof.

Notwithstanding the distribution of 2,000,000 pounds of twine, the distribution of all war-savings certificates and thrift cards used throughout the country, and all other items of vastly increased quantities of necessary supplies and equipment so essential to the successful operation of the Postal Service, there has been no substantial increase in the cost of such distribution. This has been due to a great extent to the establishment during this administration of specified distributing offices where supplies and equipment are shipped in large case and freight lots, and thence distributed on short hauls to post offices dependent upon the central distributing offices for their supplies.

At present there are central distributing offices in 37 of the States and Territories and the system is rapidly being extended to the remaining States.

In an effort on the part of the Post Office Department to cooperate with the War and Navy Departments in meeting their increased demands occasioned by stress of war for typewriting machines there was a slight reduction in the number of machines furnished the Postal Service during the current year. However, it was necessary to purchase more adding machines than heretofore, owing to the increased work placed on all postmasters through the sale of war-savings stamps, thrift stamps, and other war activities. During the fiscal year just ended the service was supplied with 936 typewriters and 513 adding machines.

Owing to the need of metal for war purposes, postmasters were cautioned to curtail requisitions for street letter-box equipment to the lowest point consistent with good service, and as a result fewer boxes were ordered than in previous years, although the demand has increased considerably since the ending of hostilities, and during the fiscal year just ended only 1,570 letter boxes, 500 package boxes, and 500 combination letter and package boxes were supplied to the Postal Service.

The extension of the use of electrical accounting and tabulating machines for use in money-order accounting has resulted in a great reduction in the cost of this work as well as a more expeditious auditing of the accounts.

One hundred and fifteen million eight hundred and sixty-nine thousand one hundred and fifty domestic and international money-order forms were furnished the Postal Service during the past year.

Orders were placed with the contractor for 105,194,050 official and registry envelopes.

The Postal Service required 755,757,000 ordinary printed facing slips.

Postal savings depositories were allowed 8,773,000 postal savings certificates of the various denominations.

Fourteen thousand five hundred and forty-four city delivery and collection satchels of various types were furnished the service during the past year; also 6,248 rural satchels and 194,634 tie straps for use on both rural and city satchels.

These improvements in method and increased efficiency in the detail of operation are only minor when compared with the larger field of activity in which this department has endeavored to serve the public on the principle that the postal administration should provide the maximum of service to the people at the minimum of expense to the taxpayer.

In the topography section the preparation of the post route Rural Delivery, county, local center, motor-vehicle truck, and air-mail maps has kept pace with the requirements of the service, and every effort has been made to secure the latest surveys and maps for the purpose of furnishing up-to-date information. New drawings of the post-route maps of various States and also county maps have been completed.

Semiannual editions of the post-route maps, numbering 35,000 sheets or 26,670 completed maps, also 17,754 blue prints of the rural delivery, county, and local center maps have been distributed to the service or sold to the public. In all 27,521 blue and negative prints were made during the year. Maps furnished other branches of the department for daily reference, including 598 post-route maps, have been corrected to date, the average number of hand corrections monthly being 21,377.

Parcel post unit numbers for all new and changed-site offices have been determined for publication in the Official Postal Guide, and all offices have been kept supplied with the parcel post zone keys for determining parcel-post rates.

A number of modern and improved methods have been adopted in the topographic section and its usefulness to the service greatly increased.

COST ACCOUNTING.

The cost-accounting system (first introduced during this administration as a part of the modern shop practice) in effect in the equipment branch has proven very helpful in the conduct of shop operations and has resulted in standardization of methods and material economies.

PURCHASES.

The procurement and distribution of supplies for the Postal Service was rendered increasingly difficult before the armistice by freight congestion in the East, fuel shortage, priorities on munitions and sup-

plies for the Army and Navy, shortage of labor, and other like conditions incident to the war. It became necessary for the purchasing agent to obtain coal and in some cases even labor for a great number of contractors and subcontractors, also to make scores of applications for priority orders and for authority to make shipments. Prices increased to abnormal levels, and in a great many cases it was impossible to obtain goods at any price, at least for anything approaching prompt delivery.

The greatest difficulty was caused by the franked envelope situation, the demands of the Government, due to the war, increasing many hundred per cent, so that approximately 1,000,000,000 franked envelopes were purchased by the various departments of the Government during the last year of the war, which, of course, far exceeds the ordinary consumption.

So tremendous were the demands of the War Department, especially for overseas shipments, and of the Navy and other departments who had to do with the prosecution of the war, that all contractors got behind with orders, and at one time it seemed doubtful whether enough envelopes could be obtained in the country to meet the Government's needs. To complicate the situation, contractors were complaining that the cost of production had increased enormously, and that they were losing heavily, some of them being threatened with bankruptcy. To furnish relief Congress authorized an adjustment to apply to all deliveries during the fiscal year. The Federal Trade Commission, in conjunction with the War Industries Board, was requested to investigate the cost of production as of July 1, 1918, and an adjustment of prices was made accordingly approximating about 100 per cent. This applied not only to franked envelopes, but to money-order forms, blanks, blank books, and other stock, also to the Postal Guide. In the previous year an adjustment of the stamped-envelope contract had been effected under a clause of the contract authorizing new styles and designs, approximating about 50 per cent.

The envelope contractors were affected like all other manufacturers with the scarcity of labor, fuel, and material, likewise with railroad congestion. These conditions became so acute that in the summer and autumn of 1918 the purchasing agent of the department took steps in conjunction with the War Industries Board to mobilize the entire envelope industry of the country. The President set aside a fund for this purpose, and arrangements were made for the Government to purchase paper and to allocate orders among all envelope manufacturers whether previously Government contractors or not. The armistice came, however, about the time it was prepared to carry this plan into effect, and it was therefore abandoned. New Government contracts for franked and stamped envelopes were

entered into at prices averaging about the same as those covered in the adjustment previously mentioned.

The duties of the purchasing agent were also greatly increased by the turning over to the Post Office Department of motor trucks, motor cycles, and aeroplanes no longer needed by the War Department. Requisitions were placed for between fifteen and twenty thousand motor trucks, motor cycles, and aeroplanes. Only about 2,000 trucks, 1,000 motor cycles, and 100 aeroplanes were delivered during the fiscal year, but preparations were completed for the delivery of a larger number.

With the cessation of hostilities the procurement and movement of supplies have been less difficult, although prices still remain abnormally high, and material has been hard to get. This applies especially to certain grades of paper. Twine that previously cost the Department 9 and 10 cents now costs nearly 30. Other cotton goods have gone up almost as much, thus greatly increasing the cost of mail bags and satchels. The prices of other supplies have been affected accordingly, and on the whole it is safe to say that supplies and equipment for the Postal Service cost on an average of 50 to 100 per cent more than before the war.

LIMIT OF WEIGHT OF FIRST-CLASS MATTER INCREASED.

Pursuant to the policy to promote the usefulness of the postal service and extend its facilities, recommendation was made in 1915 for increasing the limit of weight of first-class mail, such limit then being 4 pounds. The recommendation was embodied by Congress in the act of May 18, 1916, making the weight limit for first-class matter the same as for parcel-post matter. The additional facilities made possible by this provision have not only proven advantageous and convenient to patrons of the service but the provision has considerably augmented the postal revenue. A provision of the same act prohibits the acceptance for mailing under the penalty privilege of any article or package exceeding 4 pounds in weight unless it comes within certain specific exceptions, the purpose of the provision being to relieve the postal service of handling and transporting free of postage official matter weighing more than 4 pounds, not coming within the exceptions, which the various Governmental establishments have for mailing. However, such official matter weighing over 4 pounds is mailable under postage at the rate for the class to which it belongs.

INCREASE OF LIMITS OF WEIGHT AND SIZE, REDUCTION OF POSTAGE RATES, AND OTHER EXPANSIONS OF PARCEL-POST SERVICE.

At the time the parcel-post service was established the weight limit for parcels was fixed at 11 pounds for all zones and the limit of size

at 72 inches in length and girth combined. These limits were soon found to be so restrictive as to preclude the shipment of many articles and consequently curtail the usefulness of the service. In order that the people might enjoy the full benefits which the parcel post is designed to afford, early steps were taken in accordance with the procedure provided by the parcel-post law to broaden and liberalize the scope of the service.

The first modification, effective August 15, 1913, was to increase the limit of weight for the first and second zones from 11 pounds to 20 pounds and reduce the rates of postage for those zones. On March 16, 1914, books were added to the parcel-post classification. Seeds, plants, bulbs, etc., were also accorded the parcel-post zone rates under an amendment to the original law approved March 9, 1914.

On July 1, 1914, the weight limit for the first and second zones was increased from 20 to 50 pounds, and for all other zones from 11 to 20 pounds. At the same time the rates of postage were reduced in the third, fourth, fifth, and sixth zones. In order to accommodate shipments customarily made in standard commercial containers slightly exceeding the 72-inch size limit prescribed by the original parcel-post law, the limit of size was increased on July 10, 1915, to 84 inches in length and girth combined.

The limit of weight of parcel-post matter was further increased, effective March 15, 1918, from 50 pounds to 70 pounds for parcels mailed for delivery in the first, second, and third zones, and from 20 pounds to 50 pounds for all other zones. In connection with the conduct of experimental motor-vehicle truck routes and country motor-express routes authorized by Congress the local parcel-post rate of postage was extended in September, 1919, to fruits and vegetables mailed at any post office or point on such a route for transportation over the same and delivery at some other post office or point along the same route.

FORWARDING AND RETURNING UNDELIVERABLE MAIL OF THE SECOND, THIRD, AND FOURTH CLASSES.

In the last three annual reports the department recommended legislation permitting the prompt forwarding or return of undeliverable perishable matter and the forwarding or return of other undeliverable fourth-class matter and that of the second and third classes bearing the pledge of the sender to pay such postage upon delivery of the matter. A bill embodying such recommendation has been recently enacted into law. This law will expediate the handling and disposition of undeliverable matter, relieve the postal service of considerable labor and expense and be of great convenience and advantage to the public generally, since it will no longer be necessary to hold such mail at the office of original address pending the notifi-

cation of the addressee or sender and the receipt from him of the forwarding or return postage, as heretofore required. It will be of particular advantage in the case of perishable matter which often spoiled before the required postage could be furnished under the former procedure, which imposed inconvenience, hardship and loss upon the sender or addressee.

FREE MAIL PRIVILEGE.

In previous reports reference has been made to the enormous amount of matter carried in the mails from which no revenue was derived. The mailings of second-class matter free in the country of publication amounted during the past fiscal year to 56,480,618 pounds, and it is estimated that the free mailings of the Congress and various Government establishments under the franking and penalty privileges were considerably in excess of this. There was, in addition, a large amount of matter mailed free by soldiers, sailors, and marines stationed abroad, by certain agricultural colleges and experiment stations, and also that pertaining to cooperative agricultural extension work, copyright matter, literature for the blind, etc. Notwithstanding the enormous and constantly increasing burden thus imposed upon the postal service, there are occasional efforts to secure the free-mail privilege for other purposes. Since, as pointed out in reports heretofore, the expense incurred in handling and transporting free matter must be defrayed from the receipts from the revenue-producing mail, thus imposing a greater charge on such mail than is necessary to cover its own cost, it is not believed, in view of the interest of the general public, that there should be any further extension of the free-mail privilege.

Reference has been made in previous reports to abuses of the franking privilege which occasionally arise. The enactment of legislation such as is embodied in the printing bill now pending before Congress will go far toward confining the franking privilege to its legitimate function and reduce the amount of franked mail to a minimum.

RECEIPTS FROM POSTAGE.

The receipts from postage paid on mail matter, constituting the principal source of the postal revenue, amounted during the last fiscal year to \$398,582,668.13, or 91.37 per cent of the total revenues, an increase of 10.86 per cent over the postage receipts of the previous year. Mailings of second, third, and fourth class matter without stamps affixed, on which the postage was collected in money, produced \$26,517,548.04 of this amount. The remainder, \$372,065,120.09, was derived from the mailings of the various classes on which the postage was paid by means of stamps. The average per capita expenditure for postage for the year was \$3.70.

The provision of the war revenue act of October 3, 1917, increasing to 3 cents an ounce or fraction thereof the rate of postage on letters and other first-class matter, except drop letters on which the rate was fixed at 2 cents an ounce or fraction thereof at all offices, and increasing the rate on postal and post cards from 1 cent to 2 cents each, was repealed by the revenue act of February 24, 1919, effective July 1, 1919, on which date the former rates of postage on first-class matter again became applicable. The estimated additional postage collected during the fiscal year 1919 as a result of the increased postage rates on matter of the first class amounted to \$71,392,000. The total estimated amount of such additional postage collected during the entire period this provision was in effect, namely, from November 2, 1917, to June 30, 1919, was \$115,892,000.

Exclusive of the estimated postage resulting from the increase in the rate on first-class matter under the act of October 3, 1917, the postage receipts for the fiscal year 1919 amounted to \$327,190,668.13, or \$3.04 per capita. This was an increase over the fiscal year 1913 of \$79,994,844.16, or 52 cents per capita. These figures strikingly illustrate the wonderful expansion of the postal service during the last six years and indicate that the postage receipts have not only kept pace with the increase in population but that the individual is making greater use of the postal facilities.

The war-stamp tax on parcel-post matter provided for by the act of October 3, 1917, was continued by a provision of the revenue act of February 24, 1919, under which parcels of fourth-class or parcel-post matter chargeable with 25 cents or more postage are subject to a tax of 1 cent for each 25 cents postage charge or fraction thereof, such tax being payable by means of internal-revenue stamps affixed to the parcels.

The postage charge on aeroplane mail was originally fixed at 24 cents for each ounce or fraction of an ounce upon inauguration of the aeroplane service on May 15, 1918. This was reduced to 16 cents for the first ounce and 6 cents for each additional ounce on July 26, 1918. In both cases 10 cents of the initial charge was for special-delivery service. On November 30, 1918, the uniform rate of 6 cents for each ounce or fraction thereof was made applicable to aeroplane mail, and this rate was further reduced on July 18, 1919, to 2 cents for each ounce or fraction thereof, special-delivery service being accorded such mail upon payment of the regular 10-cent fee required for this service in addition to the postage.

ACCEPTANCE OF MATTER FOR MAILING WITHOUT STAMPS AFFIXED.

With a view to promoting the efficiency of the Postal Service and increasing its usefulness to the public, steps were taken in 1914 to extend the provision for the acceptance of identical pieces of cer-

tain classes of matter for mailing under what is known as the permit system without stamps affixed and the collection of the postage thereon in money, this method of prepaying the postage having proven highly advantageous both to the public and Postal Service, for the reason that it relieves mailers from the labor and expense of affixing and the Postal Service from canceling stamps on such matter, and thus not only effects a material economy but expedites the dispatch and delivery of mail. Legislation recommended by the department and embodied in the act of May 18, 1916, reduces the minimum number of identical pieces of third and fourth class matter which may be accepted for mailing without stamps affixed, the postage being paid in money, from 2,000 as originally fixed by the act of April 28, 1904, to 300 and 250 pieces, respectively, and extends the privilege to such second-class matter, mailed in quantities of not less than 300 identical pieces, as was previously required to have the postage paid with stamps affixed. These modifications and extensions have enabled many persons and concerns to avail themselves of the privileges of the permit system who could not formerly do so. This system has proven so highly advantageous that it is recommended that the provisions of the act of May 18, 1916, for mailing matter under permit without stamps affixed, the postage being paid in money, be extended to mailings of first-class matter in quantities of not less than 300 pieces.

POSTAL SAVINGS SYSTEM.

When this administration assumed office in March, 1913, there were approximately 312,000 depositors in the postal savings banks of the country, with slightly over \$30,000,000 to their credit, and the average per capita deposit was \$96.23. At the close of the fiscal year 1919 there were 565,509 depositors, with \$167,323,260 to their credit, and the average per capita deposit was \$295.88. The amount on deposit at the close of each fiscal year covered by this period, and the increase in deposits during each year, were as follows:

Fiscal year ended June 30—	Amount on deposit.	Increase in deposits.	Fiscal year ended June 30—	Amount on deposit.	Increase in deposits.
1913.....	\$33,818,870	\$13,581,786	1917.....	\$131,954,696	\$45,934,811
1914.....	43,444,271	9,625,401	1918.....	148,471,499	16,516,803
1915.....	65,684,708	22,240,437	1919.....	167,323,260	18,851,761
1916.....	86,019,885	20,335,177			

These figures reflect the marked growth and development of the system during this period and give rise to the inquiry as to how the forward movement was brought about.

One of the first steps taken was to transfer the business of the system, together with its corps of employees, to the bureau of the Third Assistant Postmaster General, in furtherance of the policy to assign to one bureau, in so far as possible, all functions and duties of related character. A reorganization of working force and a revision of business methods was begun immediately thereafter and no opportunities have been overlooked to substitute simple and direct methods for cumbersome, time-consuming and vexatious procedure. The business of the system is now efficiently and expeditiously conducted and is giving satisfaction to its patrons. The effect of the improved methods is well exemplified by a statement of the reduction in the staff at the central office of the system in Washington. On May 1, 1913, the date the transfer became effective, there were 176 employees in the Division of Postal Savings and the pay roll for the fiscal year 1914 amounted to \$205,528.32. On July 1, 1919, notwithstanding that the deposits had more than quintupled in the meantime, there were only 78 employees and the pay roll for the fiscal year 1919 amounted to only \$111,034.32.

One of the most pronounced obstacles to the growth and development of the system was the provision contained in the organic postal savings act limiting the amount that may be accepted from a depositor to \$100 in a calendar month and the maximum balance at credit to \$500. These limitations on deposits were precautionary, and while they unquestionably served a purpose when the service was new and in a sense experimental, the principal factor which led to the adoption of them was the fear expressed by the savings banks of the country that many of their patrons would withdraw their deposits and transfer them to the postal banks. It was conclusively shown, however, that substantially all postal-savings deposits represented the savings of wage earners who had implicit confidence in the Government and would not patronize private savings institutions, and that while millions of dollars had been called from hiding places and turned back through the medium of the postal banks into the commercial activities of the very localities from which they were drawn, yet the usefulness of the service was seriously impaired because of the hindering restrictions. Moreover, a still more serious effect than the loss to business of the rejected savings, a large percentage of which was sent abroad, was the confused thought and consequent lack of confidence manifested by prospective depositors of foreign birth, who could not understand why the Government would stand ready to safeguard a part of their savings and not all of them.

On the recommendation of the department the Congress, on May 18, 1916, amended the original postal savings law by removing altogether the provision limiting the amount that may be deposited

monthly, and increasing the amount that a depositor may have to his credit at interest from \$500 to \$1,000. Discretionary authority was also given to accept additional deposits, not to exceed \$1,000, on which no interest should be paid. Difficulties incident to the acceptance of a new class of deposits, however, requiring the adoption of new forms and accounting rules, led to the postponement of the authority to accept the noninterest-bearing deposits. Subsequently, on July 2, 1918, the Congress, on the further recommendation of the department, again amended the law by repealing the authority to accept noninterest-bearing deposits and increasing the amount that a depositor may have to his credit at interest from \$1,000 to \$2,500. A study of the above table giving the yearly increase in postal-savings deposits will show the tangible results which followed the removal of the hindering restrictions. While the response to the extension of the maximum deposit to \$2,500 was not so great as for the previous extension to \$1,000, it should be taken into account that the last extension came during the floating by the Government of popular loans calling for billions of dollars and that the subscriptions to these loans were paid very largely from the savings of the people. The substantial increase in postal savings deposits concurrent with the period of Government financing is a sure test of the place which the postal savings service fills with the people of the country, particularly when it is taken into consideration that the interest yield on the Government bonds recently floated is much greater than on postal savings deposits.

Among other progressive steps urged by the department and adopted by the Congress may be mentioned the repeal of the statutory requirement that special or distinctive stamps should be used on official mail matter relating to the system and extending the use of "penalty" envelopes therefor; the repeal of the authorization for the payment of additional compensation to postmasters of the fourth class on account of postal-savings business transacted by them, the amount that might accrue to them under the statute being infinitesimal when compared with the expense of ascertaining and distributing it; the extension of the laws authorizing the allowance of claims for losses of postal and money-order funds, stamped paper, etc., to include postal-savings funds, cards and stamps, and certificates; and the discontinuance of the 10-cent savings card, provided for in the original postal-savings act as one of the means of evidencing small deposits, and substituting therefor a card, to be furnished free, to which 10, instead of 9, savings stamps may be attached, thus reducing by one-half the accounting made necessary by the maintenance of both cards and stamps.

There has been a marked reduction in the number of post offices designated as postal-savings depositories, in furtherance of a deci-

sion made early in this administration to maintain the service at a post office only when a demand for the facility is shown by the residents of the community which the post office serves. It had theretofore been the intention, evidently, to extend the service to all post offices, and upward of 13,000 post offices had been designated as depositories. But it was found that several thousand offices, chiefly those serving small rural communities, had transacted no business at all and it was unlikely that they would do so. Immediate steps were taken to withdraw the service where it was not patronized, and the withdrawal has been continued until at the present time only 6,439 post offices, including 724 branches and stations, transact postal-savings business. The number of depository offices has, therefore, been reduced by more than one-half, with a substantial decrease in the expense of administering the system. On the other hand, the service has been extended to every post office where it was shown that savings facilities were needed, notably to post offices in Alaska, the Hawaiian Islands, and Porto Rico. The extension of the system to our outlying possessions involved the solving of a number of problems, chiefly those concerning the availability of funds; but, happily, all obstacles were overcome and the residents of these sections are now enjoying savings facilities of which, due to their remoteness, they were very much in need.

At the close of the fiscal year 1919 postal-savings funds were on deposit, at interest, in 5,211 banks which had qualified to receive them, 3,239 being national banks, 1,161 State banks, including the Territorial banks of Alaska, Hawaii, and Porto Rico, 271 savings banks, 531 trust companies, and 9 private banks under State supervision.

One of the most important provisions in the postal-savings law is the privilege extended to depositors of converting their deposits into Government bonds of small denominations. These bonds are issued semiannually in registered and coupon form in denominations of \$20, \$100, and \$500, are payable in gold coin in 20 years and redeemable at the pleasure of the United States in 1 year, bear $2\frac{1}{2}$ per cent interest, and are free of all taxes whatsoever. Their parity is maintained by the standing offer of the board of trustees of the system to buy them from holders at their face value. During the fiscal year 1919 deposits to the amount of \$194,220 were converted into these bonds, the total amount of deposits converted since the system was organized being \$11,453,100. The board of trustees purchased from holders \$1,325,160 of these bonds during the fiscal year 1919, their total purchases at the close of the year amounting to \$5,288,600. Many of the bonds were sold by the holders for investment of the proceeds in Liberty bonds and war-savings stamps.

The board also purchased \$25,000,000 of Liberty bonds during the year for investment.

A study of postal-savings statistics brings to light many interesting facts. It is shown that 75 per cent of the total deposits on June 30, 1919, were held at 100 post offices having approximately \$200,000 and over on deposit. The cities and towns served by these post offices are principally industrial communities, and the patrons of the postal bank are of the class to whom the post office is familiar ground; it is convenient, the hours of business are suitable to their pursuits, and they use it freely and extend to it their full confidence. More than half of the depositors are of foreign birth and have approximately 70 per cent of the deposits to their credit. To this class of people the postal-savings bank fills an important place in national life. They were familiar with postal banks in the land of their birth and turn to them naturally in the land of their adoption. The establishment of the service in this country undoubtedly has done much to further the Americanization movement. The ability of the foreign born to place their funds safely in this country instead of sending them to the postal banks at home, as was their practice for many years prior to the time postal banks were established in this country, has done much to sever ties which played a very important part in retarding the progress of these people toward full citizenship.

It may be asserted with confidence that the establishment of postal savings banks in this country, with the avowed purpose of encouraging economy and thrift and enabling the people to own Government bonds of small denominations, played an important part in the successful placing of the Government war loans. Those charged with the duty of installing and developing the banks soon learned that the advantages of every new public facility must be kept constantly before the people until the number of individuals making use of it is sufficient to give it a status as an accepted and familiar function of government, particularly so when the individual is called upon to change his manner of daily living in order to avail himself of the benefits of the facility. It is a well settled fact that the savings habit must not only be aroused—it must constantly be fostered. Profiting by this experience the department lost no opportunity to keep the advantages of the postal savings banks before the people during the years which preceded the World War, and during the continuance of it up to the time the Government financing began. This activity no doubt did much to dissipate the thought among the people that the underwriting of Government loans was the peculiar function of the banking world and that only the wealthy could be bondholders; it familiarized the people generally with Government bonds of small denominations, and placed many of them in a position financially where they could acquire them.

Payment of the deposits standing to the credit of deceased or legally incompetent depositors is effected speedily and with simple formality. When the amount is over \$250 payment is ordered on presentation of letters of administration. When the amount on deposit is less than that amount the department, in order to conserve the estate, undertakes to pay the deposits direct to the person or persons who, under the laws of the State of domicile of the decedent, would be entitled to receive them if administration were had. By these means nearly 17,000 accounts have been settled and over \$3,600,000 of deposits paid, and many thousands of dollars in court costs and legal fees have been saved to the heirs. There was a marked increase in the number of these cases handled during the fiscal year 1919, when 5,376 accounts were closed and \$1,652,518.60 paid, an increase over the previous year of 98 per cent in the number of cases and 166 per cent in the amount paid. The cases adjusted included 36 accounts requiring payment through consuls of foreign countries stationed in the United States to heirs residing abroad, and 34 accounts of depositors who entered the military and naval services of the United States and gave their lives for their country.

The balance sheet of the system and a detailed statement of operations will be found in tables in the appendix to this report.

MONEY-ORDER SYSTEM.

While in some respects money-order transactions during the fiscal year 1919 reflected the generally unsettled condition of business, it is noteworthy that the volume of domestic business transacted was very great, the increase over the previous year being one of the most phenomenal ever recorded in the history of the money-order service. During the seven fiscal years from 1913 to 1919, inclusive, the amount of domestic money orders issued has increased over 90 per cent. The law enabling money orders to be paid at any money-order post office, the extension of the service to naval vessels, and the action of the department in providing money-order facilities for the American Expeditionary Forces in foreign countries have undoubtedly contributed largely to this remarkable increase. Detailed references to the establishment of these features will be found in succeeding paragraphs.

The amount of international money orders issued for payment in foreign countries has steadily fallen off since the beginning of the World War, until during the year 1919 the value of such orders was less than for any similar period in 15 years. The suspension of the money-order conventions with certain European nations, the great army of foreigners who have returned to their native countries since 1914, and the violently fluctuating exchange rates are the principal contributing causes.

A detailed statement of money-order transactions will be found in the appendix to this report.

By reason of the extension of the Rural Delivery Service, causing the discontinuance of many post offices, the number of money-order offices was reduced from 55,668 on June 30, 1918, to 54,826 at the close of the same month in 1919. The service was installed at 554 post offices and discontinued at 1,393, a net decrease of 839 offices.

To provide for the prompt payment of money orders the amount of money-order funds known as "reserves," which postmasters are authorized to retain on hand, was increased \$257,375 during the year, amounting on June 30, 1919, to \$5,404,570.

The department received complaints with regard to the alleged wrong payment of 1,333 money orders, amounting to \$20,430.66. Of these orders 218, aggregating \$3,113.49, were found upon investigation to have been properly paid, while the sum of \$12,939.99, representing 792 of the orders, was recovered from the persons to whom it had been improperly paid. Because of the failure of paying officials to observe the necessary precautions \$4,244.80, represented by 315 orders, was collected from postmasters. In eight cases it was found that the wrong payment was not due to any fault of postmaster, remitter or payee, and the department therefore assumed the loss, which amounted to \$132.28.

Especial attention was given by the department during the year to complaints from soldier payees of the failure to receive money orders drawn in their favor. All such cases were accorded immediate consideration, and where it appeared that an order had been lost a duplicate was issued and forwarded at the earliest practicable date. When inquiry disclosed that the order had been paid to a person for whom it was not intended, the case was at once referred to the chief post-office inspector for investigation.

The demand by the traveling public and others that money orders be made payable wherever presented became so persistent that in 1914 the department recommended to Congress the enactment of legislation authorizing the Postmaster General, under such rules and regulations as might be necessary, to direct that money orders be paid at any money-order post office regardless of the one named in the order as the paying office. An act embodying these features was passed by Congress and received the approval of the President on February 6, 1914. In accordance with the authority thus granted, regulations were promulgated by which money orders issued at offices within the continental United States, except Alaska, may be paid at any money-order post office within the continental United States, except Alaska, if presented within 30 days from date of issue. After 30 days the orders may be paid only at the office on which drawn, or repaid at the office of issue. Patrons of the money-

order system have taken advantage of this privilege very generally, and it has undoubtedly added much to the popularity of the service.

In 1913 a committee was appointed, consisting of the Third Assistant Postmaster General, the Auditor for the Post Office Department, and representatives from the offices of each of these officials, to make a survey of the postal money-order system for the purpose of ascertaining its condition and advancing its efficiency and economical administration. The committee found that one considerable item of expense was that connected with the payment of money orders at the large post offices, and recommended the adoption of a mechanical accounting system involving the use of punched cards and electrical tabulating and assorting machines. The system was first installed at the Philadelphia, Pa., post office and proved of such value that it has since been extended to seven of the largest post offices. By adapting these devices to the peculiarities of money-order business an annual saving to the department in clerical salaries of more than \$200,000 has been effected, and the time required to answer inquiries of the public concerning the payment of orders has been very materially shortened. The system will be installed at other offices where the volume of business justifies its use as rapidly as the necessary mechanical apparatus can be obtained.

During the fiscal year 1915 arrangements were concluded with the officials of the Navy Department by which, under certain regulations, money orders may be issued and paid by Navy mail clerks on board certain designated vessels. This facility not only has increased the amount of money-order business transacted but by reason of its convenience to enlisted men has contributed materially to the maintenance of morale among sailors and marines. The war ships are designated as stations of the New York City post office and the money-order accounts are rendered to the postmaster of that city. At the close of the fiscal year ended June 30, 1919, there were 84 such stations authorized to transact money-order business.

With the entry of the United States into the European conflict steps were immediately taken to provide the members of the American Expeditionary Forces with money-order facilities. Under the general superintendence of a postal agent in Paris, branches were established in France, Italy, and the occupied portion of Germany, where domestic money orders could be purchased or cashed in the same manner as at post offices in the United States, and at the same rate of fees. Arrangements were completed by which the foreign currency in which the troops were paid could be converted into dollars for money-order purposes at the rate prescribed for Army transactions. The estimation in which this service was held by the troops is best evidenced by a statement of the volume of business

transacted. During the period from July, 1917, to June, 1919, 1,578,371 orders were issued for \$30,421,879.25, and in the same period 450,303 orders were paid for \$10,557,108.79. This service, which enabled the men to send to their relatives in the States a portion of their Army pay, and to receive remittances from home, undoubtedly played a very large part in keeping members of the forces contented under the trying situations in which they were placed.

On the 1st of August, 1914, a new and uniform schedule of fees was adopted for international money orders drawn on countries with which business is conducted through exchange offices. The new schedule was compiled with a view to correcting inequalities in charges which previously obtained and which were the cause of many complaints. It will be noted that the new fees went into effect coincident with the outbreak of the European war and its effect in increasing the business can not, therefore, be determined. It has, however, been very effective in diminishing complaints and obviating the confusion at international post offices where it was necessary to consult three fee schedules before issuing international money orders.

The conventions under the terms of which international money-order service is conducted provide that in unusual circumstances the service may be temporarily suspended. With the opening of hostilities Austria, Belgium, and Egypt notified the United States of the suspension of money-order business. Subsequently business was suspended with Germany, Greece, Hungary, Liberia, Mexico, and Portugal. At the close of the fiscal year 1919 business had been resumed only with Belgium and Mexico. Prior to August, 1914, representations had been made to the various Central and South American countries with which money-order conventions have not been concluded looking to the exchange of postal money orders. The negotiations were of necessity suspended during the continuance of the war because of unstable exchange rates, but recently the interrupted correspondence has been resumed with the result that conventions have been concluded with Brazil and Nicaragua, and money-order business will be established with these countries in the near future.

The balances arising out of international money-order business, whether due to or by the United States, are settled by means of bills of exchange. Balances due by this country are settled by bills purchased in New York City. Under normal conditions, by competitive buying, the department is enabled to make a slight gain on such transactions, but with the very beginning of the war the exchange market became thoroughly demoralized. Exchange on all European countries at first was quoted at such exorbitant rates that the department found it necessary to restrict the amount of money orders which would be sold to one person for payment in foreign countries.

This effectually prevented speculation by private bankers and commercial interests, which had been attempted, but even in handling this restricted business the department sustained some loss in the settlement of balances. Under these conditions the Third Assistant Postmaster General gave his personal attention to the purchase of exchange, and as a result, by closely studying the market, was enabled to reduce the loss to a minimum and, when the market showed a more favorable turn, to realize considerable gain on purchases of exchange.

During the fiscal year ended June 30, 1919, bills of exchange were purchased amounting to \$27,627,703.44. On these purchases a gross gain of \$1,005,320.68 was made, from which should be deducted a loss of \$419,655.09, leaving a net gain of \$585,665.59.

Since July 1, 1912, the bills of exchange purchased by the department on money-order account have totaled \$307,761,330.40. The loss to the department during that period, because of the purchase of bills at rates higher than the rate named in the money-order conventions, has amounted to \$1,333,681.48. Purchase of exchange at rates less than the money-order conventions, however, have resulted in a gain of \$6,386,317.61 leaving a net gain for the seven-year period of \$5,052,636.13.

The effect of the exceedingly unsatisfactory condition of the foreign-exchange market is not confined to the transaction of international money-order business; practically the entire business world is adversely affected. There is urgent need for a stabilization of business conditions, and this will relieve the foreign-exchange market from the violent fluctuations to which it is now subject. As soon as the business of the world is again on a solid foundation, this department will propose to foreign postal administrations a readjustment of the terms of the money-order conventions.

REGISTERED MAIL.

There was a substantial increase in the number of domestic letters and parcels registered during the year 1919 over the previous fiscal year. Fees were paid on 50,129,296 pieces, an increase of 12,531,830 over the previous year, with a corresponding increase in revenue from this source of \$1,253,183.

There was a decrease of 10,399 pieces in the number of foreign letters and parcels registered. The amount of mail registered for delivery in foreign countries has been curtailed for several years on account of conditions brought about by the World War. There will doubtless be a steady increase in foreign registrations coincident with the return to normal conditions.

Official free registration was given to 10,833,616 pieces of mail, as compared with 6,987,950 pieces in the preceding fiscal year. The

extraordinary increase in the number of official free registrations is attributed largely to the war activities of the Government.

The total registrations, paid and free, numbered 65,373,394, as against 49,006,297 in the preceding year.

During the fiscal year 1919, 3,343 claims for indemnity for the injury or loss of registered mail were approved, calling for the payment of \$44,993.45. In the previous year 3,251 claims were approved for indemnities amounting to \$38,943.66. These figures do not represent net loss to the Government, as reimbursement for an indemnity paid is frequently obtained by collection from the postal employee, contractor, or other person responsible for the loss.

The registration privilege was withdrawn from fourth-class mail on January 1, 1913, coincident with the installation of the domestic parcel post, and the insurance feature substituted. The number of domestic paid registrations immediately dropped, and continued to do so for several years, partly to this cause and partly to conditions brought about by the war. There has been complete recovery, however, so that the number of registrations on mail matter other than that of the fourth class is now far in excess of the number of registrations before fourth-class mail was withdrawn.

During the past seven years many improvements have been made in the registry system with a view to increasing its usefulness to the public and to save time and labor in the Postal Service. Among the more important of these improvements may be mentioned the abolishment of the distinctive registry stamp, the misuse of which led to annoying complications more than offsetting the advantages gained; the requirement that postmasters at United States exchange offices shall collect the deficiencies on short-paid registered mail addressed for delivery in foreign countries; changes and consolidations in registry forms and in the manner of billing registered mail; the establishment of the registered paper-jacket service with Canada; special arrangements for dispatch and delivery of registered mail between financial institutions; simplified arrangements for the delivery of registered mail and the introduction of a registry receipt that can quickly be filled out and delivered.

The registry service was used extensively for war purposes. Not only the Treasury, but the military and naval establishments, the Department of Justice, and other branches of Government found the service invaluable to them in the transmission of valuable and confidential communications, matter relating to the military draft, and the like. Financial departments of the Government, Federal reserve banks, and monetary institutions generally are constantly increasing their use of it for the transmission of packages of unusual value, consisting of coin, currency, bonds, certificates, etc. The people generally also are using it, not only for the transmission of

valuable mail, but for communications for which an acknowledgment of receipt is desired.

INSURED PARCELS.

In accordance with the provisions of section 8 of the act of Congress approved August 24, 1912, establishing the domestic Parcel Post Service, provision was made for the insurance of parcels accepted for mailing and for the indemnification of the senders in case the parcels were lost. This feature of the service has been a success from the start and its growth has been phenomenal. At the inauguration of the Parcel Post Service on January 1, 1913, a flat fee of 10 cents was charged, which insured a parcel against loss for the actual value of its contents, not exceeding \$50 in any one case.

During the first six months of the operation of the service, that is to say, from January 1 to June 30, 1913, inclusive, 2,595,185 parcels were insured. The fees collected therefor amounted to \$259,518.50. There were 1,090 claims approved during the same period on account of the loss, rifling, or total damage of such parcels involving the payment of indemnities amounting to \$10,385.60, an average of \$9.53 per parcel.

Effective July 1, 1913, a reduction was made in the fee scale so as to provide for the insurance of an article against loss for its actual value, not in excess of \$25 in any one case, upon payment of a fee of 5 cents. This action greatly stimulated the ordinary parcel traffic as well as the insured business and met an important public need. During the fiscal year ended June 30, 1914, following the introduction of the reduced fee scale, upwards of 13,000,000 parcels were insured, or more than twice the number of parcels sent by registered mail before the parcel post was established. During the fiscal year ended June 30, 1915, more than 18,000,000 parcels were insured. The marked increase in business during the fiscal years 1914 and 1915 clearly demonstrated that the usefulness of the insurance feature should be extended and that a further reduction in the fee scale should be made, whereupon a departmental order was issued, effective September 1, 1915, providing for a fee of 3 cents for insurance not exceeding \$5, and a fee of 25 cents for insurance not exceeding \$100. In the fiscal year ended June 30, 1916, approximately 25,000,000 parcels were insured. Experience gained in administering the service further proved that provision should be made for another progressive step, namely, the indemnification for partial injury to insured parcels as well as for total injury or loss. Congress giving the desired authority a departmental order to effect the purpose was made to become operative in respect to parcels mailed on and after August 8, 1916. In the fiscal year 1917, approximately 34,000,000 parcels were insured. On July 1, 1917, the use of insurance tags on insured

parcels was discontinued, and in place thereof a coupon receipt was given to the sender and a record made of the parcel at the mailing office. During the fiscal year ended June 30, 1918, over 50,000,000 parcels were insured.

In the fiscal year 1919, the number of parcels insured reached the amazing total of 69,997,889, an increase of 19,578,281 over the preceding year, and 56,634,430 over the fiscal year 1914, the first full year during which the insurance feature was available. The great increase in business during the fiscal year 1919 is due largely to the increase of the limit of weight of parcels to 70 pounds when mailed in the first, second, and third zones, a maximum distance of 300 miles, and to 50 pounds beyond.

Thus the remarkable growth of the insurance feature of the parcel post is traced to the continuous efforts of the department to enhance the service by means of successive improvements and reductions in the fee scale.

Provision was also made for furnishing receipts to senders of parcels not insured upon payment of a fee of 1 cent. This receipt carries no indemnity features; it is merely evidence of the deposit of the parcel in the office of dispatch.

Claims for indemnity to the number of 191,538 were paid during the fiscal year 1919, amounting to \$1,499,412.90, an average of \$7.81 per piece of mail. These figures are not fairly representative of the losses which have accrued in that year inasmuch as patrons are allowed six months from the date of mailing in which to file their claim for loss or injury, and many claims are filed, considered, and paid after the close of the year in which the loss or injury occurred.

COLLECT-ON-DELIVERY SERVICE.

This facility was made available to patrons of the parcel post on July 1, 1913, and enabled the sender of a mailable parcel, on which the postage was fully prepaid, to have the price of the article and charges thereon collected from the addressee on payment of a fee of 10 cents, provided the amount to be collected did not exceed \$100. The payment of this fee also insured the parcel against loss, without additional charge, in an amount equivalent to its actual value, but not to exceed \$50.

The coupling of this feature with the new Parcel Post Service had the effect of stimulating mail-order business by making it unnecessary in many transactions for purchasers to pay in advance or for sellers to extend credit. The "C. O. D." feature immediately became very popular by reason of the many purposes for which it could be utilized, its simplicity of operation, and the promptness with which collections were returned to the senders. During the fiscal year ended June 30, 1914, the first year it was in effect, nearly

3,000,000 parcels were handled, involving total collections of over \$14,500,000, and on which the money-order fees alone exceeded \$168,000. In the following year over 4,700,000 parcels were handled, and the growth thereafter continued unabated until in the fiscal year ended June 30, 1919, 14,383,668 parcels were handled, an increase of 4,738,811, or 49.13 per cent over the previous fiscal year. The fees collected on 1919 business amounted to \$1,473,960.

Effective July 1, 1917, the collection-on-delivery rates were changed to require the payment of a fee of 10 cents for a collection of \$50 or less, and 25 cents for a collection over \$50 and not in excess of \$100, in order to conform to the insurance rates. On the same date the limits of indemnity for which the department was liable for injury to or loss of such matter were increased to provide for \$50 for a 10-cent fee and \$100 for a 25-cent fee. The need for the change was evidenced by the fact that over 132,000 parcels were mailed at the 25-cent rate during the first fiscal year of its operation.

Shortly after the service was inaugurated complaints reached the department calling attention to the practice of certain firms in sending articles collect-on-delivery to persons who did not order them. Prompt measures were taken to eliminate this fraudulent practice, and certain firms which persisted in it were prosecuted in court. These measures had the desired effect, only an occasional complaint now being received. Prompt measures also were taken against the equally fraudulent practice of sending in a "dummy" or "fake" package containing no fourth-class matter, a bill, whether receipted or not, for the purpose of having the service collect an old debt.

During the fiscal year 1919, 18,846 claims for indemnity for the loss to or injury of C. O. D. parcels were approved, calling for the payment of \$165,255.45, an average of \$8.77 per parcel.

STAMPED PAPER.

Audited sales of stamps and other postage stamped paper in the fiscal year 1919 amounted to \$392,965,009.74, an increase of \$38,995,148.01, or 11.02 per cent, over the preceding fiscal year. The gain is due in part to the increased rates of postage which were not in force during the first four months of the preceding year. Sales of war-savings and thrift stamps, less thrift stamps exchanged, amounted to \$524,501,217.29, and of proprietary and documentary stamps to \$10,516,008.85. The value of stamped paper of all kinds sold by the Postal Service during the fiscal year 1919 therefore amounted to \$927,982,235.88, an increase of 29.89 per cent over the sales of the preceding year. A summary of the transactions will be found in the appendix to this report.

During the past year the activities of the department with reference to stamp issues have been more varied and extensive than ever before in the history of the Postal Service. In addition to the usual duties of supervising the production, issuance, and redemption of postage stamps, postal cards, stamped envelopes and newspaper wrappers, the issuance of war-savings, thrift, and documentary stamps, and the accounting which attends these functions, the following has been accomplished:

A 6-cent airplane stamp, a 3-cent "Victory" stamp, and a 13-cent stamp for payment of registry or special-delivery fee and a single rate of letter postage, were issued and placed on sale.

Special postage stamps surcharged "Shanghai, China," were issued for sale by the United States postal agency at Shanghai.

The 56,000 post offices of the country were stocked with 2-cent adhesive postage stamps and stamped envelopes and 1-cent postal cards in anticipation of the reduction on July 1, 1919, of the war-time rates of postage.

Preparations were made to retire the outstanding 3-cent postage stamps and stamped envelopes and 2-cent postal cards rendered unserviceable by the reversion to prewar rates.

Post offices were stocked with the 1919 issue of war-savings stamps.

Post offices were stocked with proprietary internal-revenue stamps, in compliance with the law providing for their sale by the Postal Service.

The unsold war-savings stamps of the 1918 issue, to the number of 57,345,943, were retired and destroyed.

Preparations were made for the issuance of \$100 Treasury savings certificates.

The stamp system has been in use in the Postal Service since 1847, and at the present time approximately 90 per cent of the postal revenues are collected through the use of stamped paper. The many extensions of the stamp system to various Government activities connected with the collection of the revenues and financial operations generally have demonstrated its great worth and efficiency. During the last six and a half years the Post Office Department has put out many new issues to meet the constantly changing conditions and developments in its service, and mention may be made of the following:

Postage stamps in denominations of 7, 9, 11, 12, 13, 20, and 30 cents.

Stamp books containing 96 1-cent, 24 1-cent and 24 2-cent, and 12 3-cent stamps.

Two-color stamp of \$2 and \$5 denominations.

A 3-cent "Victory" stamp.

Airplane stamps in denominations of 6, 16, and 24 cents.

Stamps overprinted "Shanghai, China," for use on mailings from the United States postal agency at Shanghai.

Two-cent postal cards.

Three-cent stamped envelopes.

New design of 1-cent postal cards.

New design of 1, 2, 4, and 5 cent stamps on embossed stamped envelopes.

War-savings stamps, series of 1918 and 1919.

Thrift stamps.

Documentary internal-revenue stamps.

Proprietary internal-revenue stamps.

Stamped envelopes of a new grade of paper, known as "extra quality."

Window stamped envelopes (envelopes which are ready for mailing without either addressing or stamping, thus eliminating two office functions).

Under a new contract effective July 1, 1919, the cost to the department of stamped envelopes and newspaper wrappers was increased, and as the law provides that stamped envelopes shall not be sold at less than the cost thereof, in addition to their postage value, corresponding increases were made in the scale of selling prices. The increased prices necessarily applied to the stamped envelopes held in stock in post offices throughout the country, which the department had purchased from the contractor at the old prices. A profit to the postal revenues estimated at \$130,000 will ultimately accrue to the postal revenues from this source when the old stocks are sold.

Following is a summary of the value of postage stamps, postal cards, and stamped envelopes, issued to postmasters, and the audited sales thereof, during the fiscal years 1913 to 1919, inclusive:

Fiscal year ended June 30—	Issues to postmasters.	Sales by postmasters.
1913.....	\$260,977,247.11	\$239,749,038.55
1914.....	263,945,840.79	258,421,952.04
1915.....	267,718,981.74	256,037,008.51
1916.....	286,940,837.31	277,608,304.86
1917.....	314,582,960.72	295,173,821.09
1918.....	387,992,228.61	353,969,861.73
1919.....	444,046,285.72	392,965,009.74
Total.....	2,226,204,382.00	2,073,924,996.52

It will be noted that the stamp sales, with the exception of the fiscal year 1915, in which business suffered serious depression due to war conditions, increased substantially year by year and now approach the \$400,000,000 mark.

Transactions incident to the issue of postage stamped paper run into totals almost beyond human comprehension. There were 609,853 requisitions for postage stamps and other stamped paper filled in the fiscal year 1919, calling for 15,142,453,359 adhesive stamps, 466,924,490 postal cards, 1,844,884,905 stamped envelopes and newspaper wrappers, 133,180 international reply coupons, 59,625 postal-savings cards, 548,400 postal-savings stamps, 152,384,640 war-savings stamps, 165,144,700 thrift stamps, 131,178,741 documentary and 188,570,500 proprietary internal-revenue stamps. The total number of units issued was 18,092,282,540, an increase of 1,612,679,607, or 9.79 per cent, over the previous year. The stamp books totaled 32,200,765 and the coils of stamps 2,517,474.

The value of damaged postage stamped paper redeemed from postmasters during the past year was \$1,632,719.37; of postal-savings issues, \$2,520,757.70; of war-savings and thrift stamps, \$155,574.74. The routine redemptions therefore amounted to \$4,309,051.81, to which may be added the special redemption of retired 1918 war-savings stamps, amounting, as stated elsewhere in this report, to \$286,729,715.

The loss of postage stamps by burglary has continued to decline, notwithstanding that the average quarterly value of post office stocks in 1919 was \$40,000,000 in excess of the average quarterly value for the previous year. Claims to the number of 302, for \$56,329.44, were received during the fiscal year 1919, a decrease of 13 per cent under the previous year. This does not include, however, 198 claims for losses of war-savings stamps, valued at \$167,688.22, which were also received during the year. A comparison of claims for losses of postage stamps by burglary received during the fiscal years 1913 to 1919, follows:

1913	\$117, 734. 59
1914	148, 770. 45
1915	197, 011. 88
1916	144, 440. 54
1917	80, 040. 46
1918	64, 675. 91
1919	56, 329. 44

The decline year by year since 1917 is due to increased activities of postmasters and post-office inspectors, under direction of the department, to protect the outstanding stocks of stamps, and also in no small degree to the central-accounting system, which makes the holding of large stocks in the district post offices unnecessary.

The accounting by postmasters for war savings and thrift stamps involved the rendition and audit of about 50,000 monthly accounts.

current during the fiscal year just closed. A compilation of the audited accounts shows that the gross sales of war savings and thrift stamps by the postal service during the fiscal year amounted to \$598,005,122.29. This is approximately 83 per cent of the value of all war savings and thrift stamps sold, the remaining 17 per cent being sold by the Treasury Department and through Federal reserve banks.

The retirement of the 1918 issue of war-savings stamps as of December 31, 1918, necessitated the return to the department for redemption of all unsold stamps in post offices. Stamps to the maturity value of \$286,729,715 were so received and destroyed. The task of counting the returned stamps and the stating of credits due 4,000 accounting postmasters was accomplished by a joint committee, made up of representatives of the Post Office and Treasury Departments, in a period of 39 business days.

The instructing of postmasters in matters relating to the registration and payment of war-savings stamps, the securing from them of the necessary proof required by the regulations governing payments for stamps belonging to deceased owners, and for registered stamps that have been lost or destroyed, and for other cases in which special authority for payment must be obtained from the Treasury Department, creates a steadily increasing volume of correspondence, and has necessitated the development of an administrative system to handle it and the organization and training of a special correspondence force.

The act of Congress approved March 3, 1917, authorized the designation of districts and of central offices in such districts, for the economical distribution of supplies and the administrative examination of accounts. Under this authorization the "central-accounting" system has been inaugurated, the plan being to designate a post office in each county to supply the smaller offices in the county with stamps and to clear their postal accounts. The new system reduced the number of stamp charge accounts maintained in the department at Washington, and the number of stamp accounts to be rendered to the department, to be audited and recorded therein, from approximately 56,000 to 4,000. It also placed the source of stamp supply much nearer to the smaller post offices, enables them to obtain stamps more promptly, and to keep smaller stocks, thus lessening the risk of loss by fire and burglary.

Mechanical office equipment installed in the division of stamps has effected improvement in the methods of filling requisitions of postmasters, recording them, keeping the accounts and reviewing monthly and quarterly reports. Original requisitions are filed in lieu of book accounts, thereby eliminating individual charge ledgers.

DIVISION OF DEAD LETTERS.

In March, 1913, a complete survey of the activities of the Division of Dead Letters was inaugurated, which resulted in the immediate improvement of the sanitary conditions incident to the treatment of undelivered mail in the department. Tons of undelivered matter were disposed of forthwith. Thousands of communications received daily, upon which treatment was necessarily delayed, because of the inefficient methods involved in the examination and manipulation thereof, were more promptly acted upon, so that no letter mail remained on hand more than 24 hours. Thousands of pieces of merchandise, mailed as parcel post and lost in transit, were given immediate attention, instead of treatment after days and sometimes weeks of delay. All of this improvement was due to the use of modern mechanical devices, such as lightning letter openers and the introduction of modern office practice.

While under the supervision of the Fourth Assistant, the cost of handling undelivered mail had been reduced approximately \$100,000 per annum, although a vast additional amount of fourth-class or parcel-post mail appeared for treatment.

After the preliminary improved methods had been adopted it was apparent that this function was coincident with the treatment of mailable matter in post offices, and the division, in its improved condition, was transferred to the Bureau of the First Assistant.

In 1913 the sending of undeliverable postal cards and post cards, amounting to approximately 1,000,000 pieces per month, to the Division of Dead Letters was discontinued, and they are now disposed of by the various postmasters where they accumulate. During that year time-saving devices, such as letter-opening machines and an improved sealing machine, were installed. In July, 1913, the Postal Laws and Regulations were amended so as to require the direct return from post offices of address to foreign administrations through the respective exchange offices of all prepaid undeliverable foreign matter sent to this division, thus avoiding delay in returning such matter to the countries of origin. During that year an order was issued requiring the sending of parcel-post matter to postmasters at headquarters of the 15 divisions of the Railway Mail Service. This saved the accumulation of a very large quantity of such matter at Washington, thus avoiding the cost of unnecessary transportation and providing for the quicker return of articles to senders where they could be identified. During 1914 a card-index system was adopted for recording letters containing valuable inclosures, discontinuing the old method of making such records in bound volumes.

At the request of the Department an item was contained in the appropriation act of July 28, 1916, reducing the limit of time that letters containing valuable inclosures should be held awaiting reclamation, from four years to one year. An order was also issued that year reducing the time for holding parcel post matter awaiting reclamation, from 12 months to 6 months. These regulations saved much time and expense in handling undeliverable mail and prevented an unnecessary accumulation at headquarters.

Under authority of the act of August 28, 1916, branches of the Division of Dead Letters were established in New York, Chicago, and San Francisco for the disposal of undeliverable mail originating in States adjacent to those cities. Mail from the New England States and from the State of New York is sent to New York city, while 14 States send mail to Chicago, and 8 States and the Territory of Alaska to San Francisco. Mail from the other States and the District of Columbia is sent to the Division of Dead Letters at Washington. The work of these branches has been merged with the work of the post office where located, with little increase in force, while it has been found possible to materially reduce the number of employees in the Division of Dead Letters.

During the war much extra work was required of the Division of Dead Letters in cooperating with the Board of Censorship with the censorship work.

On April 7, 1917, an order was issued, directing that all letters or packages originating within the United States or its possessions and destined for Germany and the other Central Powers allied with Germany in the conduct of the war should be sent to the Division of Dead Letters. Under this order, approximately 500,000 letters and parcels were sent to this division, and for a time some 40 or 50 translators from the Department of Justice were working in conjunction with this division in the handling of such mail.

The net revenue derived from the sale of parcel post and unclaimed letters for the fiscal year ended June 30, 1913, amounted to \$31,645. While for the year ended June 30, 1919, the net revenue amounted to \$199,222. Of this amount \$123,520 was realized from the sale of parcel post.

The division is more than self-sustaining at the present time, whereas it was operated at a loss at the beginning of the six years' period noted.

The receipts of letters and first-class mail in the Division of Dead Letters and the branches thereof at New York, N. Y.; Chicago, Ill.; and San Francisco, Calif., for the fiscal year ended June 30, 1919, aggregated 22,982,605 pieces, an increase of 8,530,652 over the preceding 12 months. Of the number received, 8,055,989 were

returned to senders, and 107,408 filed for reclamation. The abnormal receipts may be attributed largely to conditions growing out of the war, as approximately 6,000,000 undelivered letters were returned to the dead-letter service from the American Expeditionary Forces, and nearly 2,000,000 from the several military camps in this country. Such of these letters as it was necessary to open to identify the writers were found generally to contain personal correspondence only which did not disclose sufficient information to secure return to the senders and consequently they were destroyed. The unusual receipts may also be attributed in part to the mailing of letters by soldiers abroad inclosing personal messages only directed to persons who had apparently removed from the address given and could not be located. Over a million and a half of letters which did not bear the sender's return card, and were so carelessly or incompletely and insufficiently addressed that they could not be delivered, were received in the Division of Dead Letters. Each of these letters represents a loss in the minds of the senders, and it is evident from these facts that the exercise of reasonable care in the addressing of mail matter would do as much as any one thing to maintain an efficient and satisfactory mail service.

The additional work required in the treatment of this unusual number of letters fell more heavily and directly on the Division of Dead Letters and the dead-letter branch at New York than on the branches at Chicago and San Francisco. The receipts of the division increased 2,004,102 letters, and the receipts of the New York branch 5,897,549, and although the reports of the remaining branches showed that more than normal conditions prevailed the amount received did not so fully reflect the effect of the war on the volume of matter handled.

In examining opened letters 1,030,449 were found to include articles of value other than correspondence and they were therefore made a subject of record. Of these 69,641 contained money which with currency found loose in the mails amounted to \$159,532.44. United States bonds, War Savings certificates, and similar inclosures aggregated 1,530, valued at \$3,638.37; and checks, drafts, money orders, and inclosures of like character were found in 138,697 letters with a nominal value of \$4,851,011.21. In the preceding year there were received a large number of letters containing small amounts of money and addressed to persons or firms classed as "fraudulent," consequently a comparison of the reports does not fully indicate the additional work performed in the treatment of letters inclosing currency.

The revenue from the dead-letter service amounted to \$182,917.99 in money removed from letters, found loose in the mails, received for

postage, or derived from the sale of parcels, and \$16,304.12 from postage stamps withdrawn from letters or found loose in the service, a total of \$199,222.11, or \$105,870.23 more than for the preceding year.

Undeliverable parcels and articles of merchandise found loose in the mails and turned in to this division, or to post offices at the respective division headquarters of the Railway Mail Service, amounted to 653,106 pieces, 419,146 of which were addressed parcels, and 233,960 articles were so insecurely wrapped that they were found loose in the mails. In the treatment of these parcels 230,307 were restored to owners and 341,338 held for reclamation. The remainder, 81,461, consisted of matter without obvious value or articles of a perishable character which could not be held awaiting application therefor. The sale of parcel-post matter held for six months, after careful effort had been made to secure its restoration to the owners, produced a net revenue of \$123,520.28.

INSPECTION SERVICE.

At the beginning of the present administration the Postmaster General found that the important position of chief post office inspector, which was at one time in the classified civil service, had been taken out of it by an Executive Order of date January 4, 1910, and a man without the Postal Service was given this very important assignment. The Postmaster General recommended at once that it be restored to the classified service, and under date of May 7, 1913, this administration showed its belief in the justice and propriety of recognizing merit and efficiency in the civil service by restoring the position to its former standing. The Postmaster General thereupon selected for the position a regular, classified, civil service employee, who had entered the service originally in a low-grade position and after 25 years of meritorious and efficient work had demonstrated his fitness for the position of chief post office inspector.

The inspectors' force is the only arm of the Postal Service where it becomes necessary to know the political affiliation of those who compose it. The reasons for this will readily suggest themselves to one of thoughtful mind. The inspectors are the eyes and ears of the Postmaster General, through whom he gains substantially all knowledge of service conditions, and through whom he must receive information upon which conclusions are formed to base his action.

Through the inspectors come reports speaking as to the conduct and efficiency of thousands of postal employees, and upon which in all cases where complaint has been made the retention or dismissal of the employee depends. Frequently where complaint has been

made the postal officer or employee by way of defense contends that partisanship is the sole basis thereof, and in order that there may be no chance for injustice, the practice has been to detail two inspectors of opposite political faith, so that the joint report submitted by such inspectors may make it as certain as possible that considerations of partisanship shall not enter into or control the Postmaster General in any action that he may take; hence it is quite frequently necessary to have information as to the political affiliations of the members of the inspectors' force. It is true that if it were desired to use the great postal organization for partisan political purposes, the one arm of the service that could be used most effectively would be the inspectors' force, members of which are to be found in every congressional district in the country. Considering the very near power of life and death held in the hands of these officials over each postal employee within the territory falling under their jurisdiction, it can readily be seen how potential a factor the inspector could be made if those in power could bring themselves to use him for so base a purpose. Without reference to what may or may not have been done in the past, the Postmaster General when he came to the head of the Postal Establishment had a fixed purpose that the department personnel should not be used for political purposes. There has been no waver from this purpose, but on the contrary it has been at all times and under all circumstances rigidly adhered to.

An investigation of the personnel of the inspectors' force at the beginning of the present administration disclosed that of the 395 inspectors then in the service, approximately 90 per cent of them were not only affiliated with one particular political party but apparently had been selected from one faction of that party. Many States like Mississippi and Vermont had no representation in the inspectors' force, whereas many other States, like Indiana and Ohio, had more than their just quota of representation therein. This may have been accidental; or, it may have been the inevitable result of the continued control of one political party for a long term of years; but whatever the reason or causes that brought about this condition, it existed, as has been stated. Of course, such conditions should not be permitted to continue. The Postmaster General could not with fairness to the membership of the inspectors' force effect at once a change of the conditions referred to. He reached the determination, however, that the best interests of the service required that this inspectors' force be fairly apportioned between the States, each to receive without reference to whether it was a certain or a doubtful political State its just quota, and that the whole number of inspectors should be equally divided between the

political parties. Once determined upon, this policy was conscientiously adhered to and faithfully carried out. As has been stated, it could not be done at once, but as vacancies occurred through deaths, resignations, removals, and reassignment, the positions were filled in strict conformity with this policy. In order that no injustice should be done to any inspector in the force by sudden or arbitrary action, it required nearly four years before the desired result could approximately be brought about. Finally, on February 16, 1917, the President at the request of the Postmaster General issued an Executive order to the following effect:

Hereafter, in filling vacancies in the force of post-office inspectors, the Postmaster General shall apportion them by States, based as nearly as possible upon population as determined by the last decennial census. The force shall also be apportioned fairly between the political parties, and advancement in the service shall be based upon merit.

At the present time the inspectors' force is made up of the chief inspector and seven inspectors-in-charge who are of one political affiliation and eight inspectors-in-charge who are of another political faith. The inspectors are fairly apportioned, each State having its just quota, and they are equally divided between the political parties; thus, each inspector now knows that his promotion is dependent alone upon merit and efficiency. This policy will continue during the present administration.

During a large part of the last fiscal year, work resulting from the state of war with Germany continued to demand the attention of the post-office inspectors. In addition to the investigations which would not be called for in ordinary times, such as those covering the need of postal facilities at military camps, shipbuilding plants, and munitions factories; the qualifications and loyalty of hundreds of applicants for positions of trust; the use of the mails for the dissemination of disloyal literature; and charges of disloyalty, there resulted a great increase in the number of irregularities which regularly fall to the inspectors to investigate. The obvious difficulties in the way of obtaining proper identification naturally caused a large number of wrong payments of money orders and wrong deliveries of registered letters, while the circulation through the mails of huge quantities of Government securities, such as war savings stamps and liberty bonds, naturally resulted in the increase in the number of all sorts of irregularities in connection with the handling of this mail.

During the fiscal year 494,104 cases were jacketed, as compared with 427,342 for the previous year, an increase of 66,762 cases. During the year the inspectors collected and disbursed in the field

\$4,963,341.06, over $2\frac{1}{2}$ times the amount collected in any previous year. Three thousand ninety-eight arrests were made, against 2,870 in 1918, evidencing the effort made by the department to apprehend those who have been guilty of the theft and rifling of matter intrusted to the mails.

Among the important criminal cases handled by the inspectors was that covering the holdup and robbery of Missouri, Kansas & Texas Railway Train No. 27, near Paola, Kans., July 10, 1918, when a number of valuable mail and express packages were stolen and some passengers and members of the train crew injured by shots. The investigation, which extended from the place where the robbery occurred to Indiana on the east and California on the west, reflected great credit on the inspectors who participated in it, not only on account of the quality of their work but on account of the results obtained, for what appeared to be one of the most dangerous bands of criminals, still in their youth, was exterminated, two members being sentenced to long terms in prison, two killed while resisting arrest, and one dying in jail.

To enable the department to readjust the pay of contractors for carrying the mails, investigations were made into the costs and different conditions on a great many routes, which resulted in saving the contractors from loss or bankruptcy and at the same time made it possible to maintain the service at fair cost.

Inspectors were called upon during the period of Government control of telegraph and telephone systems to investigate the causes and illegal conduct of individuals in strikes which occurred in many sections. About 90 cases covering strikes and charges of discrimination were investigated.

By mutual agreement with the Canadian authorities, and by arrangements made within this service economies were effected in the handling of complaints of irregularities in the foreign mails, which, in spite of the difficult clerical situation, enabled this office to keep this work practically current.

During the epidemic of influenza the service in a number of places was seriously curtailed, and in some places, especially in the West, the department was notified that post offices had been closed on account of the illness of postmasters and clerks. In such cases inspectors were notified and directed to promptly arrange for proper service.

Owing to the number of losses of parcel post packages mailed in cities of the East and destined for western points, a committee of inspectors was assigned to make an investigation. They covered the terminal facilities of the larger cities, the railway post offices,

transfer points, and shipments in storage cars. The information obtained and their recommendations were of much benefit to the department in arranging for proper safeguards to this class of mail.

The records of this office show that during the past fiscal year 23,594 complaints and inquiries were received, alleging violations of the Postal Laws and Regulations of nearly 200, having reference to the transmission through the mails of obscene, scurrilous, disloyal, and lottery matter, and use of the mails in furtherance of schemes to defraud, respectively. Such complaints have been referred to the field for investigation, resulting in a large number of successful prosecutions and the issuance of fraud orders in many cases.

Investigation of cases charging violation of the espionage act have been continued throughout the year. Among the cases of this character, based on the disloyal activities of persons engaged in the dissemination of seditious or treasonable literature, was the investigation of the operations of the I. W. W. organization at Chicago, Ill., which was notable both in the amount of work required on the part of the inspectors assigned to the case, and the volume of matter mailed out by the conspirators. By virtue of search warrants issued under the provisions of the act referred to, the inspectors seized large quantities of such literature deposited for mailing in post offices, all of which was of a questionable character and approximately 99 per cent was of a character prohibited by law.

During the year there were received reports of inspectors containing recommendations for the issuance of fraud orders in 61 cases, which were referred to the solicitor for consideration. In accordance with such recommendations, 27 fraud orders were issued. Directions to postmasters in eight instances, looking to the withholding of mail under the provisions of the espionage act, were also issued.

Owing to the increase in all lines of the work of the inspector's force, appropriations for additional inspectors and clerks have been requested in the current estimates.

ENFORCEMENT OF THE ESPIONAGE AND TRADING-WITH-THE-ENEMY ACTS.

The enforcement of the espionage and trading-with-the-enemy acts has been carried on throughout the year. The character of the disloyal and seditious matter found in the mails since the signing of the armistice has differed materially from that which the department dealt with during the prosecution of the war. It is now of a radical, revolutionary type, having for its object the solidification of the revolutionary elements in this country and the overturning of our present form of government by force.

There has been a marked increase in revolutionary propaganda, both in English and in foreign languages. The department has endeavored to deal with this matter in the most expeditious manner.

FRAUD ORDERS.

Vigorous enforcement of the laws covering the conduct of schemes for obtaining money or property through the mails by means of false and fraudulent pretenses, representations, and promises has been continued throughout the past fiscal year. Upon evidence submitted and recommendations made by post-office inspectors a large number of cases dealing with persons and concerns found to be conducting schemes to defraud the public have been considered and satisfactorily disposed of by the issuance of fraud orders or otherwise. Many of these cases were strongly contested, and the evidence frequently was of an involved character, the exercise of great care being necessary in arriving at a just decision. In all instances the department has endeavored to accord to those charged the fullest opportunity to be heard and to submit any evidence considered material to their defense. It has been the constant aim of the department to dispose of these fraud cases in the most expeditious manner consistent with a due regard for the importance of the work, and with proper precaution against doing injustice to those affected. A vast amount of money is annually saved to the public through the efforts of the department in connection with the suppression of these fraudulent schemes.

LOTTERIES. *

There was a marked increase during the last several months of the past year in the number of prize schemes to be conducted as a means of stimulating business over the number submitted during the months immediately preceding the signing of the armistice. Thus far, however, very few well-established business concerns, with the exception of certain newspapers, have returned to this expedient. Those now employing this method of increasing business are, as a rule, new in their respective fields.

BONDS OFFERED AS SECURITY FOR POSTAL SAVINGS DEPOSITS.

The number of State and municipal bond issues submitted for examination as to their legal acceptability as security for postal savings deposits decreased during the year owing to the abnormal conditions prevailing in financial circles during the war and continuing even after the signing of the armistice. However, the many projects held up throughout the country on account of the war are now being

started, and bond issues of the States and municipalities floated for the purpose of carrying out these undertakings are beginning to appear in large numbers, indicating that in due course the bond examining work will resume its former large proportions, the added value accruing to an issue of bonds after having been approved as postal savings security resulting in the tendering as such security of portions of practically all of the more or less prominent issues. Prompt examination of the issues is very necessary if the Government is to reap the full benefits of the Postal Savings System, and during the year practically all cases submitted were disposed of without delay, cooperation by the banks and bond dealers in promptly furnishing necessary data being a contributing factor in this respect.

General knowledge by bondmen of the close scrutiny by the department of the issues submitted has resulted in the offering of a higher grade of bonds than formerly.

OBSCENE AND INDECENT MATTER.

The statute prohibiting the transmission in the mails of obscene pictures, indecent post cards, publications, and other matter containing obscene or suggestive illustrations, advertisements of obscene books, pictures, etc., has been vigorously enforced, and as an appreciable reduction is noted in the quantity of such objectionable matter submitted during the past year, it is believed that the strict enforcement of this law has had good results. Under section 211 of the Penal Code the term "indecent" includes matter of a character tending to incite arson, murder, or assassination. It became necessary during the past year to refuse transmission in the mails of several publications of an inflammable character designed to incite the weak minded or vicious to acts of violence and leading to "arson, murder, or assassination."

CLAIMS OF POSTMASTERS FOR REIMBURSEMENT FOR LOSSES SUSTAINED.

During the fiscal year 550 claims were presented by various postmasters for reimbursement for losses alleged to have been sustained through unavoidable casualty such as fire, burglary, etc. Three hundred and ninety-one of these claims were approved and their aggregate, \$91,173.27, was allowed, the remaining 159 claims being disallowed as not being meritorious under the law.

COST OF THE WAR TO THE POST OFFICE DEPARTMENT.

In response to a Senate inquiry as to the cost of the war to the several departments of the Government, the report of the Post Office Department, early this year, showed that the war had entailed upon

the department an expenditure of approximately \$52,766,976 above the cost of its ordinary service. These extraordinary expenditures amount in round figures to \$30,000,000 from April 6, 1917, to December 31, 1918. Obligated expenditures and those estimated to June 30, 1919, the report stated, would amount to \$22,679,351.

STATISTICS.

Tables presenting statistical data with respect to the department's affairs and the audit of its accounts will be found in the appendix to this report.

It is felt that special recognition in this report should be accorded the officers and employees of the department who have rendered invaluable service and whose sympathetic support and assistance have been a source of great help to the Postmaster General in handling the added labors and responsibilities falling upon the department during the crucial war period.

Respectfully submitted.

A. S. BURLESON,
Postmaster General.

REPORT OF THE SECRETARY OF THE NAVY.

SECRETARY'S OFFICE, NAVY DEPARTMENT,
Washington D. C., December 1, 1919.

To the PRESIDENT:

I have the honor to submit herewith the annual report of this department for the fiscal year ending June 30, 1919, including operations, recommendations, and estimates to date.

The armistice of November 11, 1918, which marked the end of the fighting, was the signal for the Navy to undertake a stupendous task. There were more than 2,000,000 men of the Army in France who, since we entered the war, had been carried there by the transports of the whole world. A little less than 1,000,000 of them had been carried by American transports. Bringing them home was a job for the Army and the Navy working together in the close cooperation which characterized them throughout the whole war. The particular function of the Navy was to receive the men in the French harbors and land them in the United States. Assistance from foreign shipping in returning our men was almost negligible, and yet, although American transports carried less than half of the force to Europe during the 19 months between the time we entered the war and the date of signing the armistice, they brought back practically the whole force in half the time it took to carry them over. To accomplish this, every available merchant vessel was converted for transport service, every suitable man-of-war was utilized as a transport, and toward the end of the undertaking we used a number of German vessels which were turned over to us by agreement.

Obviously the stream flowing eastward could not be reversed instantly, but, after a careful survey of the situation, a tentative schedule was prepared in consultation between the Army and Navy, showing by months the number of men that the Navy believed it could carry across the water if the Army would deliver them as the ships were available. This schedule was steadily bettered as time went on, and in the month of June, 1919, 340,946 men embarked from

France. The high-water mark for a month going eastward, when desperate haste was necessary and the whole world was joining in the operations, was 311,359.

It was a matter of common knowledge that, their work well done, our troops abroad were naturally anxious to come home at the earliest possible moment, and the Navy is prouder of nothing it accomplished in the war than of this feat of bringing them home promptly, safely, and, all circumstances considered, comfortably.

Transports which had been carrying troops eastward were considerably increased in capacity, it being no longer necessary to carry guns and gun crews, run without lights, or continue the elaborate precautions against enemy attack that were essential when they were running the submarine gauntlet. In the conversion of the additional vessels made into transports the experience already gained was utilized to the utmost, but without disparaging the material side of this undertaking, which was handled with the maximum of efficiency, the credit must mainly go to the organization and operation. The work was systematized and planned ahead to the last detail and went like clockwork. No railroad operates its trains with greater system and accuracy than this ferry across 3,000 miles of water, with its storms and fogs, was conducted for months.

I may illustrate by a case which came under my personal observation which was paralleled again and again by the Navy transports. I was a passenger on the *Mount Vernon* (formerly the liner *Kronprinzessin Cecilie*) which left Brest, France, on Friday, May 9, 1919, carrying soldiers. Eight months before, it had been torpedoed, but saved by the skill and courage of its officers and crew. The day before arrival, the transport bound eastward and many miles out at sea had reported that she would reach Brest the next morning, needing no repairs, no water, no coal, and would sail for home as soon as the troops were on board. She did arrive Friday morning. Before she came in sight through the mists to the westward, her complement of troops was making its way in heavy marching order from Camp Pontanezen to the piers at Brest, there to be loaded on barges for transfer to the ship, for in Brest no transport could come alongside the piers. The vessel anchored in the harbor of Brest at 9.30 o'clock Friday morning, and at 4.25 p. m., carrying 5,800 soldiers, was again under way to the westward almost before the foam-streak of her eastward passage had disappeared. That night Capt. Dismukes stated that, with good weather, he would reach New York late the following Friday night; with bad weather, some time on Saturday. In spite of heavy seas the vessel anchored off quarantine, New York, during the night of Friday, May 16, and reached her pier early the next morning. This was not an exceptional performance; it was simply a repetition of what the same transport had done on the pre-

ceding trip, and there were plenty of cases of even shorter stays on the other side.

As may be imagined, this was a hard service. The transports were manned mainly by reservists who had enlisted for the war and were as anxious to get home as the soldiers. The department fully realized the conditions, and on every ship there was a board of officers whose duty it was to consider applications for discharge and select the most deserving cases. There was not a ship where these officers did not find great difficulty in making these selections, for the reason that there were so many more cases having the strongest claims for discharge than could possibly be released. In spite of their anxiety to get back to civil pursuits, and the great sacrifices which many were suffering through the necessity of retaining them, the naval reservists as a whole realized the situation and carried out their arduous task willingly and cheerfully. It was with profound satisfaction that the department was finally able to release these boys—for most of them were but boys—and allow them to return to their homes and families with the proud feeling of duty well done.

Next to bringing home the brave soldiers, the work of demobilization of men and ships was the duty to which the Navy addressed itself. Naval bases in France, in Great Britain, in the Azores, with large equipment, prepared for a long war, were put out of commission rapidly and without great loss. Temporary training stations and bases in this country were quickly demobilized. Only those who have gone through this process appreciate the fact that the difficulties of this going to peace are more complex and troublesome than going to war. Hundreds of ships, naval and cargo, were to be placed out of commission, some sold, others returned to their owners, and others salvaged. The strain of patrol in rough seas told upon ships as upon men.

The man power has been decreased from over 500,000 to 132,000. Of the 300,000 naval reserves all but 1,800 officers and 4,700 men have been released from active duty. The enlisted strength of the Regular Navy, which reached 218,000 in the peak of the war, has been reduced almost one half. The Marine Corps regulars numbered 65,000, of which only 17,000 remain in the service. Practically all the marine reserves have been released. The spirit of the great financier who said, "The way to resume is to resume," has characterized the Navy. When war came it practiced the maxim, "The way to mobilize is to mobilize," and it hastily drilled and trained over 400,000 new men who gave a good account of themselves on both sides of the ocean. The fighting ended, the slogan was, "The way to demobilize is to demobilize," and in spite of the varied duties, naval and civilian and relief, undertaken by the Navy, demobilization was nearly a finished fact on the day that the transports bringing soldiers canceled their

sailing schedules. The celerity of it and the efficiency of it was paralleled only by the Navy's ability to organize and increase itself many-fold and be able to say, "We are ready," from the day the President proclaimed the existence of a state of war with Germany, April 6, 1917, until the armistice silenced the guns on November 11, 1918.

It is more difficult to demobilize without essential loss than to mobilize. In mobilization the national spirit runs high; there is a goal to be reached; the effort is cumulative; pressure is felt on all sides; and the service of mass and momentum is in evidence at every stage. Mobilization was Americanism finding and vindicating itself on sea in the greatest crisis of history, the barest recital of which is epic in its reach and dramatic in its appeal.

In the present year, demobilization has claimed attention; but the task has been not merely to demobilize but to do this without disorganizing. It was not a question of untying a knot that has been successfully tied, or of undoing what has been victoriously done. It was rather a question of reshaping, rebuilding, realigning, and without the sacrifice of national spirit, unity, or force. Many new lessons have been learned, and these have been embodied in the new Navy. Experience, intelligently interpreted, is always the best teacher, and this is especially true when the experience has been spread over so great a stretch of time and space as was the case in the World War.

Two fundamental principles have been constantly borne in mind:

(1) There must be and there has been no loss of adaptability to new and unexpected issues. The readiness to hit and to hit hard, which won the plaudits of our Allies at the very outset, has been preserved in every detail of change and readjustment. The Navy is returning to a peace basis, but it is conserving the power that enabled it and will again enable it to meet with unweakened sinews any crisis that may arise. Security for the future, though an uncertain future, has not for a moment been lost sight of.

(2) There must be and there has been no loss of symmetry or wholeness in the naval organization. A reduced personnel has not been allowed to mean fragmentariness or disproportion in whole or in part. As a vast machine, as a national organism, as a complex of interacting agencies, the Navy is in form and spirit a unit, not a fraction.

Though demobilization has returned over 400,000 men from military to civilian pursuits, there are now in the Navy more than twice as many enlisted men as there were on January 1, 1917. Both the Navy and Marine Corps are at present below their authorized strength, but an active and successful recruiting campaign has been launched, and the time is not far distant when the attractions of Navy life will secure the full complements desired. Those in train-

ing and afloat are sufficient to man all dreadnaughts and modern destroyers, and the 400,000 men given naval training in war provide a naval reserve of fit and experienced men upon which the country can call in any emergency. This is an asset not before possessed in this decade and one which gives assurance until the youths coming into the service are skilled in all the callings that make up good seamen.

The United States Navy emerged from the war incomparably stronger and more powerful than ever before—second only to that of Great Britain and far in advance of any other foreign navy, in ships, in men, and every element of strength. The organization of the fleet in two great divisions gives us ample defense in the Pacific as well as the Atlantic. With battleships in service equal to or superior to any now in commission, 6 huge battle cruisers and 12 battleships under construction, a number of them larger than any now in commission, to be armed with 16-inch guns, more powerful than any now afloat, the Navy is pressing forward to greater things, justifying, in peace as in war, the country's firm confidence in its "first line of defense." The great fleets, one in the Pacific and one in the Atlantic, are powerful, well officered and manned, and give guaranty of protection and of readiness to serve our country and the world.

In aeronautics the year has been made memorable by trans-Atlantic flight, the most notable accomplishment yet achieved in navigation of the air, a United States Navy seaplane being the first to cross the ocean that divides America from Europe. The voyage of the *R-34* from England to America and return, and of our own *C-5* from Montauk to Newfoundland demonstrated the possibilities of lighter-than-air craft, and we are making every effort to achieve in dirigible balloons the same high place we have won in the production of seaplanes. The purchase in Great Britain of a sister ship of the huge *R-34*, and the construction in this country of another monster rigid dirigible, will give us two airships of the largest type. For their accommodation, as well as construction and repair, we are erecting a hangar of unprecedented size. Seaplanes, kites, and dirigibles were used with gratifying success in the fleet maneuvers at Guantanamo last spring; battleships and other vessels are being supplied with flying machines, and we are making naval aviation more and more an integral part of the fleet, to accompany our fighting ships and operate with them wherever they may sail.

One of the most hazardous tasks in which our Navy has engaged, the sweeping up of the more than 50,000 mines we planted in the North Sea mine barrage, stretching from the Orkney Islands to Norway, has been successfully accomplished by our mine force, and its vessels have returned to home waters, where the brave men who

were engaged in this dangerous service have received many proofs of the Republic's admiration and gratitude.

Its war service completed, the Navy turns to peace-time duties with the same energy, devotion and zeal which characterized it during the period of active hostilities. There are many problems still to be solved, much to be done to bring our fleet and shore establishment up to the high standard which is our goal. That these are being accomplished steadily and upon sound principles, no one can doubt who knows the service and its spirit. Progressive in peace, instant in action, it will be prepared for any duty when the country makes call upon it.

The same teamwork which marked the successful administration of the Navy in war has been in evidence in demobilization and will continue in the duties of peace. I wish to bear testimony to the united, cordial, and elbow-to-elbow cooperation in spirit as well as in performance which has characterized the men of the Navy afloat and ashore, extending from the ranking admiral to the least known youth, who soon catches the all-together spirit of the Navy.

This teamwork in war and in readjustment has not been confined to the Navy or the Navy Department. It has extended to every branch of national work. The close cooperation between the State and Navy Departments in all foreign relations and duties has been increased, and naval readiness to carry out national decrees fully demonstrated. Even before our entrance into war, the War and Navy Departments were truly two arms of one body, and our military success may be attributed to the heartiness and understanding with which we worked together in the preparation and execution of every war plan. The unexampled success of the troop movement across the seas was jointly planned and jointly carried out, and in the Navy there is gratification that, as courage matches courage in battle, cordial cooperation matches efficient coordination in conception and direction between men of the Army and men of the Navy. The relation of the Navy to the Shipping Board was so intimate that in war effort they were one, while the Food Administration learned to rely upon the Navy across the sea as its strong right arm.

Labor was the rock upon which our preparation and supplies depended. It was mobilized and efficient. Acting with closest accord with the Department of Labor, it was the privilege of the Navy to aid in stabilizing labor and in proving that the Government is the best employer. The day of giving to skill and toil a mere living wage has passed. It is entitled, after a fair day's work, to a fair day's wage, sufficient for comforts and some luxuries as well as necessities. Navy wages have never lagged. They have generally led, and for good pay it has, from its patriotic workers, received a good

day's work. Without the greatly increased production, due to the skill and industry and fine spirit of patriots in overalls, our men in arms could not have been furnished the required munitions and supplies.

The attraction of higher pay in the merchant marine has caused the Navy to lose many men, many petty officers, and not a few warrant and commissioned officers. This has made it impossible to fully man all the ships. This loss has been greater than numbers indicate, because those who have left the Navy were experienced and qualified, while the recruits now enlisting must be trained before they are fitted for the more important duties. The high wages paid to machinists, electricians, and other skilled men in private industries has prevented the Navy's securing new men in the ratings most needed. It is to be hoped Congress will increase the compensation early so that many of these men will have a suitable inducement to reenter the naval service. As a rule they prefer it to any other, but duty to their families in the time of high cost of all necessities of life has compelled them to seek places where the pay is higher.

On the 12th of November, in hearings before the House Committee on Naval Affairs, which had under consideration a bill to give an increase of 30 per cent to all active and retired naval officers and 50 per cent to all enlisted men, I advocated a graded increase based upon the necessity imposed by the enhanced cost of living. Opposing the percentage increase, I showed that the Navy Department and Congress had not been unmindful of the service and needs of men in the Navy during the war, but pointed out that the war increase through temporary promotions and commutation to officers at sea would shortly expire, and early action was needed to provide additional compensation in keeping with that enjoyed by most men in the trades and professions.

NEW FLEET ORGANIZATION—ATLANTIC AND PACIFIC.

The large increase in the number of destroyers (we will soon have 300), and the completion and commissioning of new dreadnaughts and other craft has made possible what the protection of our coasts has long demanded—the maintenance of a powerful division of the American fleet in both the Atlantic and the Pacific. It has been a source of regret to all who believe equal protection should be given to all portions of our coast that our Navy has heretofore lacked enough ships to warrant two great divisions, one in the Atlantic and one in the Pacific. It is a matter of national congratulation that our naval strength at last permits this, along with the utilization of the Panama Canal for the defensive purpose for which it was con-

structed. For years the advocates of an isthmian canal pointed out that one of its chief values and uses would be to double the effectiveness of our fleet.

ADVANTAGES OF PANAMA CANAL UTILIZED.

Shortly after the opening of the Panama Canal, the World War demanded the mobilization of all naval strength in the Atlantic, on the eastern coast and overseas. It was not, therefore, until August of this year that the canal was utilized for the chief purpose for which it was constructed when, led by Admiral Rodman's flagship, the *New Mexico*, the newly organized Pacific Fleet made its passage through that canal with the ease and celerity which justified all that its projectors and constructors claimed for it. One hundred and eighty-five ships of the Pacific Fleet, aggregating 525,000 tons, and the equal number of equal tonnage in the Atlantic Fleet, will make their passage through the canal from time to time as they come together, in drill and in maneuvers, and in competition.

"OREGON" STEAMED 68 DAYS TO REACH SANTIAGO.

The value of the Panama Canal from a naval standpoint was never before so fully appreciated. Though wise men for generations had advocated an isthmian canal, it was a real naval necessity that compelled its construction. The country felt that need sorely in 1898, when it required 68 days for the *Oregon*, then the best ship of our Navy, to reach Cuba from the Pacific Coast. It was a long trip, all the way around the Horn, and under forced draft it required more than two months to make the journey. To-day the trip from San Francisco to Cuba can be made in almost the same time as a ship could cross the Atlantic. The difference in time might mean the difference between victory and defeat, for the *Oregon* was the first-line ship in 1898, and took a leading part in the naval achievement at Santiago. If the enemy then had been stronger, it could and would have forced battle before the arrival of the *Oregon*, but with the open isthmian canal the Atlantic and Pacific fleets could carry out the plans already formulated for operating as one fleet before any enemy could try conclusions with us.

PASSING OF FLEET THROUGH CANAL MARKS NEW EPOCH.

The passing of the majestic fleet, led by oil-burning dreadnaughts and the first electrically propelled flagship, was a spectacle that marked a new epoch in history, demonstrating the wisdom of Senator Morgan, the pioneer legislator who led the way in advocacy of an isthmian canal; of the late President Roosevelt, the able and forceful Chief Executive who led the way in the construction, and

the other men of vision who saw its maritime and military importance.

AMERICA'S GREAT ARMADA ORGANIZED IN TWO DIVISIONS.

In the summer, after careful consideration, the American Fleet was organized, in two divisions, one under the command of Admiral Henry B. Wilson, known as the Atlantic, and the other known as the Pacific, under command of Admiral Hugh Rodman. The organization has been so perfected that when at stated periods they are consolidated not a single additional order will be necessary for all units of both divisions to act as one mighty fleet. The unified command is settled, and well worked out plans will make the American Fleet function with as much efficiency as if there were not two divisions in separate oceans. Indeed, the training in the two oceans will make them more fit, for in the past our dreadnaughts have practiced in only one ocean, whereas it is planned, in the course of time, for all the ships and all the personnel to sail both oceans and be as much at home in one as in the other.

INCREASES EFFECTIVENESS OF OUR NAVAL FORCES.

This new organization increases the effectiveness of our naval forces and practically doubles the field and extent of our fleet training in tactics and war problems. Each fleet is at all times within supporting distance of the other and all the ships of both could combine into one fleet before an enemy could, in any important strength, attack either coast. The Navy by this means not only protects each of our long seacoasts, but places a wall of steel around our ocean boundaries which produces a sense of security such as we have never enjoyed before.

WILL DEVELOP BASES AND YARDS ON PACIFIC COAST.

The protection furnished depends not only upon the ships themselves, but also upon the naval bases and navy yards which are necessary for the maintenance of the ships, and only their use by a large force of ships during times of peace will cause the yards and bases on the Pacific coast to be so developed as to make them ready for the conditions which would exist in time of war. The increase in the size and number of ships in the Navy already exceeds the present capacity of the yards on the Atlantic coast, and those on the Pacific must be utilized and enlarged to meet present as well as future needs.

SHIPS OF SAME TYPES IN BOTH FLEETS.

The tactical requirements which would arise when the two fleets are combined have all been foreseen. Ships of all the various

classes—battleships, cruisers, scouts, destroyers, submarines, fuel ships, and auxiliaries—have been placed in equal numbers of divisional units in each fleet so that there will be no confusion or necessity for reorganization when the two fleets come together.

NAVY MUST NOT BE ALLOWED TO "GO STALE."

The danger to every Navy after a great war, indeed the national tendency, if history is any test, is for fleets to become stale. The United States Navy in the War of 1812 saved the day after disasters on land. Our country emerged from war with a victorious Navy, comparatively strong and manned by alert and capable men of the sea who had won in a decisive sea battle with the most powerful maritime nation in the world. Within a few years our Navy had almost gone into innocuous desuetude, and no forward steps of importance were taken until in the days of Secretary Dobbin, in Pierce's administration, the construction of frigates made up the backbone of the Navy which in the sixties hastened the victory of the Federal forces, when the naval blockade literally "bottled up" the ports of the South. The pressure of this blockade squeezed her to death, and sea power was the determining factor of victory in that as in most wars. At the end of the war in 1865 the American Navy was superior to any in the world.

DECLINED AFTER CIVIL WAR—SLOW IN REBUILDING.

Again the Navy went stale. There was a revulsion against war and preparation for war. Congress reduced the Navy to such small proportions that there were not enough ships to justify giving commissions to all the graduates of the Naval Academy, small as the number was. It was not until the days of William E. Chandler and William C. Whitney that serious undertakings were commenced to build the "White Squadron," the beginning of the modern navy. And there was little appreciation, even then, of naval needs. The Spanish-American War gave another impetus to naval building, but it hardly survived as a national incentive through two sessions of Congress, though steady if slow progress was made.

It was not until President Wilson threw the weight of his influence in favor of his three-year building program in 1916 that any systematic, continuous, and constructive policy on a large scale was entered upon. Then came the World War with the pressing need of smaller craft to meet the hitherto unknown menace to ships, the American-invented submarine, that stiletto of the sea which became the most destructive agency of maritime warfare the world had ever dreamed. During that war, the Navy by its readiness and efficiency won world confidence and world commendation, and more than half

a million of the flower of our young countrymen came into its service and made possible all that it achieved.

RUSH TO LEAVE SERVICE AS SOON AS WAR ENDED.

Again the history of naval regression threatened to repeat itself, and, indeed, to some degree has recurred. Scarcely had the armistice been signed when the young men who had served so well looked eagerly to return to the pursuits of peace, and only the sense of duty held them in the Navy until the soldiers who had won glory in France could be brought back home in transports manned by the Navy. Then the seamen were released but did not leave the Navy. The large majority remain in the militant Naval Reserve, fit and willing to return if their country again needs them. Not a few officers of the regular service felt the call to duty on shore, and, having performed a great task greatly, were desirous of severing their connection with the Navy. Keen and very able civilians and naval men, who had centered all their thoughts upon improving naval engines of offense, suddenly turned to the study of instruments to increase production in field and factory. There was danger of the Navy going stale in 1919-20, as it had gone stale following every other war.

TWO FLEETS INSURE NEEDED COMPETITION.

Competition is ever and in all callings the basis of progress, of advancement, of perfection. Every effort to find a substitute has failed. This is as true in preparation for defense as in the industrial world. Unless there could be introduced into the Navy the incentive of victory, the stimulus of an inspiring and honorable competition, what assurance was there that the Navy succeeding the World War would be different from what followed all previous wars?

The creation of the Pacific Fleet, equal in material and personnel to the Atlantic Fleet, gives, in addition to its other advantages, the necessary element to guarantee the competition essential to excellence. These two fleets will have generous rivalry. Already in these early days the fleet spirit has been born, it will grow, and in the contests between them will be developed an efficiency which could not have been obtained by mobilizing all the ships in one big fleet all the time in one ocean. The contests which are to be arranged and the frequent coming together will strengthen the spirit of competition and prove the wisdom of securing excellence through competitive contests in gunnery, in target practice, engineering, seamanship, and all branches where war-games and simulated warfare call forth the highest skill and effort.

THE RECEPTION TO THE PACIFIC FLEET.

The reception of the Pacific Fleet by the people of the Western States was unprecedented in enthusiasm and generous welcome. Four reviews were held by the Secretary of the Navy—at San Diego, Los Angeles, San Francisco Harbor, and at Tacoma. The review at Seattle by the President of the United States was the culminating event. The patriotic people, eager to welcome their fleet for whose coming to make its home in their ports they had long waited, came from all the trans-mountain States in such numbers as had not before gathered on the coast. For the first time in American history a mighty Pacific Fleet rode the western waters and when the ships of the fleet let go their anchors in their Pacific home ports, the people of that great section of our mighty Republic felt a sense of protection and recognition which gave them a new thrill of pride and a new feeling of security. The governors of the States were present to open all doors of courtesy; mayors and other officials in State, city, and county vied with each other in literally strewing with roses the path of the men of the fleet when they came ashore to the delightful receptions and entertainments planned for them. The key of every city on the coast was presented and with it the hearts and homes in a gracious hospitality that gladdened the heart of every seaman, from the distinguished commander in chief of the fleet to the youngest recruit making his first cruise on a man-of-war.

PRESIDENT REVIEWED FLEET IN PUGET SOUND.

The greatest occasion of weeks of reception was the arrival of the President of the United States, the Commander in Chief of the Navy, and the review of the fleet by him in Puget Sound, near Seattle. It was a perfect day, the people gathering from all the Northwest to do honor to the President and to the fleet. The historic *Oregon* had been re-commissioned and for the time revived the pride we felt in her in the days of her eventful cruise. It was upon the deck of that ship the reviewing party stood as the fleet sailed through the Golden Gate, and it was fitting that, in the grand review on Puget Sound, the *Oregon* should be the ship upon whose deck the President received the salutes and honors when the dreadnaughts and the flotillas of destroyers thundered their welcome to the head of the Government.

It was not only in these five beautiful harbors, where all the Pacific fleet came together, that there was cordial welcome. At every seaport where the draft permitted their entrance ships of the fleet paid visits to the towns and cities and received the hospitality of the people, all the way from Long Beach to Victoria, and in his flagship

Admiral Rodman was present at Vancouver to present the greetings of the Navy to the Prince of Wales upon the Prince's visit to British Columbia.

ENTHUSIASTICALLY RECEIVED IN HAWAII.

The splendid dreadnaught *New York* visited Hawaii, carrying the Secretary of the Navy, Admiral McKean, Admiral Parks, Commander Hilton, and Commander Foote, who, in addition to visiting all harbors on the Pacific coast, made a trip to those islands to take part in the opening of the new dry dock at Pearl Harbor and to study the needs of that naval base in view of the organization of a large fleet in the Pacific. If the welcome to the fleet had been warm and cordial by the people of the west coast, that given by the Hawaiians was, if possible, even more enthusiastic. It was an event of world interest, the completion and opening of the Pearl Harbor Dry Dock, not only for naval purposes but for commercial advantage as well, for that dock, over a thousand feet long, will insure suitable docking for commercial ships that ply the Pacific as well as for naval vessels. With the enlargement of the facilities at Pearl Harbor naval base, recommended to Congress, that station will be fitted not only to dock but also to repair any ship of any nation crossing the Pacific. The importance of such a navy yard and dry dock at this strategic and commercial center can not be overestimated.

The Hawaiians have long looked forward to the completion of this undertaking, with an interest heightened by the untoward incident which destroyed the plans when the dock, nearing completion, "sunk-up," by an earth upheaval, in the early part of 1913, and caused many to believe it was not possible to construct a large graving dock on that foundation. The completion, flooding, and dedication of the dock to the god of sea power, on the 21st day of August, 1919, was, therefore, of deepest significance to the people of Hawaii and of large value as a stimulus to the increasing commerce by big ships in the Pacific.

BATTLESHIPS' SERVICE IN EUROPE—WORK OF THE FLEET.

When hostilities ended we had nearly four hundred vessels operating in European waters, and these were returned as rapidly as possible. After the surrender of the German fleet at Scapa, at which our battleships serving with the British Grand Fleet, were present, the six battleships, comprising Division 9, Rear Admiral Hugh Rodman commanding, proceeded to Brest, where they met the three battleships of Division 6, Rear Admiral Thomas S. Rogers commanding, which had been operating from the base at Berehaven, and several

divisions of destroyers, all of which, under command of Admiral Sims, took part in the demonstration on the arrival of President Wilson, who went to France on the U. S. S. *George Washington*, escorted by the *Pennsylvania*, flagship of Admiral Henry T. Mayo, commander-in-chief, United States Atlantic Fleet.

WELCOMED HOME BY NAVAL REVIEW.

Immediately after the demonstration at Brest, our battleships hoisted the "homeward-bound" pennant and set sail for the United States. Their return from European service was signalized by a notable naval review, December 26, 1918, for which all available ships of the fleet in home waters were assembled. Arriving off Ambrose Lightship the afternoon of Christmas day, the battleships the next morning steamed into New York, where they were accorded a great demonstration, the review being followed by a land parade of all the returning officers and crews. The Secretary of the Navy, aboard the *Mayflower*, and the Assistant Secretary aboard the *Aztec* had as their guests the Secretary of War and other members of the Cabinet, Senators and Members of Congress, representatives of the diplomatic corps, officers of the Army and Navy, and distinguished civilians who had rendered conspicuous service during the war.

TRIBUTE TO THE RETURNING BATTLESHIPS.

On the eve of the naval review, the Secretary of the Navy issued this tribute to our battleship forces returning from service abroad:

In welcoming home the powerful American dreadnaughts which have been engaged overseas during the war, the American people will greet the officers and men with pride and congratulations. These powerful ships, the equal of any in the world, in cooperation with the British Fleet, gave such predominance of Sea Power in the North Sea that the German Fleet dared not invite suicide by coming out and offering battle. They did not try conclusions because they knew there never was a fleet in being that could have had a chance of victory against the British and American Fleet, working together with the same signals and the same strategy as if they were the naval power of a single nation. Their mission was as single as if they had represented only one instead of the two great English-speaking nations. Their united service typified and cemented the ties between our country and Great Britain. Their silent vigils protected commerce, secured safe passage of troops and supplies, and effectually bottled up the German Fleet, rendering it as impotent for harm as if it had never been constructed.

Sea Power once again demonstrated its primacy in making land victories possible. While the American dreadnaughts, an important part of the world's strongest armada, were not given an opportunity to win a great sea victory, they did more: They cooperated in receiving the surrendered German Fleet, which capitulated to the superior force of the allied fleets, and they will be received at home with all the honors given to valiant victors.

SERVED A YEAR WITH BRITISH GRAND FLEET.

Division 9, composed of the *New York* (flagship), *Texas*, *Nevada*, *Wyoming*, *Arkansas*, and *Florida*, served for a year with the British Grand Fleet, being designated the "Sixth Battle Squadron." The *Delaware* served in this division until July 30, 1918, when it was relieved by the *Arkansas*. Assigned one of the two places of honor and importance in the battle line, this American division did its full share of the Grand Fleet's work, including patrol search for the enemy, protection of convoys, mining, and other forces, and, most important of all, in the repeated attempts to engage the German High Seas Fleet, for which the ships of the Grand Fleet were kept in the highest state of efficiency and readiness. Our battleships were attacked six times by submarines. On one occasion, off the Norwegian coast, four torpedoes were fired at the *Florida* and two at the *Delaware*, and at another time three were fired at the *New York*. Not one of our vessels was hit, and the only damage done was to the *New York*, which while leading the division into Pentland Firth, was rammed by a submerged submarine. Two blades of her propeller were broken off, but officers and crew were convinced that the blows from the propeller sank the U-boat.

Division 6, composed of the *Utah* (flagship), *Nevada*, and *Oklahoma*, was based on Berehaven, Bantry Bay, Ireland, its principal duty being to protect our convoys from possible enemy raiders. This division made two trips into the Channel, escorting convoys when enemy submarines were reported in the vicinity.

ADMIRAL BEATTY'S FAREWELL.

On their departure, Admiral Sir David Beatty, the British commander in chief, in an address on board the flagship *New York*, paid this tribute to the officers and men of the American battleships which served with the Grand Fleet:

I could not let the Sixth Battle Squadron go without coming on board the *New York* and saying something of what I feel at this moment of your departure. I had intended to ask Admiral Rodman to permit me to say something to representatives of all the ships of the Sixth Battle Squadron on board his flagship, but exigencies of the service have not permitted me to do that, and therefore, as Admiral Rodman has said, what I say to you, I hope you will promulgate to your comrades in the other ships, and not only to them but also to your comrades of the Atlantic Fleet.

There is not much that I have to say, but what I do say I hope you will understand comes from the heart, not only my heart, but the hearts of your comrades of the Grand Fleet.

I want, first of all, to thank you, Admiral Rodman, the captains, officers, and ships' companies of the magnificent squadron, for the wonderful cooperation and the loyalty you have given to me and to my admirals; and the assistance that you have given us in every duty you had to undertake. The support

which you have shown is that of true comradeship; and in time of stress, that is worth a very great deal. As somebody said the other day, "The fighting is now over, the talking is now going to begin;" therefore, I do not want to keep you here any longer, but I want to congratulate you for having been present upon a day which is unsurpassed in the naval annals of the world. I know quite well that you, as well as all of your British comrades, were bitterly disappointed at not being able to give effect to that efficiency that you have so well maintained. It was a most disappointing day. It was a pitiful day to see those great ships coming in like sheep being herded by dogs to their fold, without an effort on anybody's part; but it was a day that everybody could be proud of. I have received messages from several people, offering sympathy to the Grand Fleet, and my answer was that we do not want sympathy; we want recognition of the fact that the prestige of the Grand Fleet stood so high that it was sufficient to cause the enemy to surrender without striking a blow. I had always certain misgivings, and when the Sixth Battle Squadron became a part of the Grand Fleet those misgivings were doubly strengthened, and I knew then that they would throw up their hands. Apparently the Sixth Battle Squadron was the straw that broke the camel's back. However, the disappointment that the Grand Fleet was not able to strike their blow for the freedom of the world is counteracted by the fact that it was their prestige alone that brought about this achievement.

During the last 12 months that you have been with us, we have learned to know each other very well; we have learned to respect each other; we know each other's faults (are there any in the Sixth Battle Squadron, Admiral?); we know each other's good qualities, and I want you to take back a message to the Atlantic Fleet that you have left a place, a very warm place in the hearts of the Grand Fleet, which can not be filled until you come back or send another squadron to represent you. You have given us a sample of the Atlantic Fleet which I think will try the Atlantic, efficient as it is, very hard to reproduce. I do not know what Admiral Mayo will say to that, but Admiral Rodman will put it up to him that way.

I understand that you are now going down to Portland, where you are going to get leave—that is so, Admiral, is it not? After that, you have a duty to perform of bringing your President to these waters; and then you will return to your own shores; and I hope in the sunshine, which Admiral Rodman tells me always shines there, you won't forget your "comrades of the mist" and your pleasant associations of the North Sea.

This is a queer place, as you have found out, but you are not the first to find it out. There was a great explorer, Marco Polo, who after traveling over the world for 30 years, one day found himself in the North Sea, and then went home, went to bed, and did not travel any more. I trust it will not have the same effect on any of you. But I can say this for you, that those of you that I have seen during the last 12 months seemed to have improved in many ways, if it was possible; and I think that the North Sea has a health-giving quality which must be put against all the bad points, of which there are so many.

I thank you again and again, for the great part the Sixth Battle Squadron played in bringing about the greatest naval victory in history. I hope you will give this message to your comrades: "Come back soon. Good-bye and good luck!"

DESTROYERS AND PATROL CRAFT RETURNED.

The destroyers, converted yachts, submarine chasers, submarines, and other craft which had been on duty in European waters were

returned to the United States as rapidly as conditions permitted, and a month's leave was given to the personnel before taking up other duties.

UNITED STATES FLEET FORMED—WITH ADDITIONAL FORCES.

On January 8, 1919, the "United States Fleet" was formed, consisting of Battleship Force 1, Battleship Force 2, Cruiser Force, Destroyer Force, Mine Force, and Train. A submarine detachment and an air detachment were added shortly afterwards.

EXTENSIVE EXERCISES HELD AT GUANTANAMO.

Battleship Force 2, the Destroyer Force and Train sailed February 4, for a winter cruise in southern waters, and were joined at Guantanamo by one division of Battleship Force 1 and the Submarine Detachment. The seaplanes of the Air Detachment were flown to Guantanamo, two from Hampton Roads and four from Pensacola. The Cruiser Force and most of Battleship Force 1 were employed in transporting troops from Europe.

UNPARALLELED DEVELOPMENT IN TACTICS.

At Guantanamo extensive tactical exercises and target practice were carried out, and the development of the fleet in tactics during this period was greater than during any other equal period of time in its history. The system of tactics developed during the war was given extensive trials and proved to be most effective.

NEW OPERATIONS SUCCESSFULLY CARRIED OUT.

For the first time in our Navy—

Battleships, destroyers, submarines, and aircraft took part in fleet exercises as component parts of one force.

An adequate number of destroyers were present with the battleships to simulate the operations of a destroyer force in a major action.

Aircraft located a force at sea and furnished information which enabled a division of submarines to simulate a successful attack upon a supposed enemy force.

Airplanes took the air from turrets of battleships at sea.

Submarines operated with battleships over an extended period, taking part in battle exercises each day and steaming continuously between battle exercises.

The new system of signals prepared by the code and signal section, Office of Naval Operations, in cooperation with the commander in

chief, was tested and proved to be more satisfactory than the standard system in use. Great improvements were made in radio communication by the adoption of more efficient procedure and intensive training of operators.

ATLANTIC FLEET GOES SOUTH JANUARY 8.

Extensive overhaul and repair of ships was impracticable during the war and was delayed afterwards because all facilities were required to keep the troop-carrying ships fit. This necessary work has been done during the past few months, and all the dreadnaughts will have finished the necessary repairs and alterations by the close of the year. On the 8th of January Admiral Wilson, commander in chief of the Atlantic Fleet, with 8 of the most powerful dreadnaughts, 56 destroyers, submarines, and auxiliaries will go to Guantanamo for the regular winter maneuvers. They will be followed later by the pre-dreadnaught ships, which will leave Atlantic ports as soon as they can be manned.

EXTENSIVE GUNNERY EXERCISES CONDUCTED.

Last spring the fleet devoted much attention to gunnery exercises, both in Cuban waters and later off the Chesapeake capes.

These consisted of short-range and director practices and torpedo defense practice by the ships which had not carried out these practices, long-range day spotting practice with 12-inch guns, and long-range day individual practices. Spotting from airplanes, seaplanes, and kite balloons was successfully carried out for the first time.

TARGET PRACTICE SHOWED GRATIFYING RESULTS.

Considering the additional conditions imposed, such as extended range, smoke interference, etc., and the fact that many of our ships had, during the war, little opportunity for target practice or thorough training of recruits in gunnery, the results attained were very gratifying.

Experience gained from results of sea battles in the war with Germany, and a critical comparison of our own gunnery with that of our associates in the war, has not indicated the desirability of any change in the principles of gunnery training that were developed prior to the war, expanded to meet war conditions, and continued throughout the war with satisfactory results.

EFFORTS TO INCREASE GUNNERY EFFICIENCY.

Every effort is being made, under the direction of Capt. W. D. Leahy, director of target practice, to train the new personnel and bring the fleet up to the high standard of gunnery efficiency that

prevailed before the war. Some problems in gunnery can not be solved by the use of a towed target, and for future advanced practices at long range under battle conditions, it is proposed that an obsolete battleship be used as a target, the ship, after being set in motion, to proceed under her own steam, with no one aboard. This proposition, which experts believe will enable our gunnery officers to make an important test in the solution of certain problems, is being given consideration.

STANDARDIZED PRACTICE OF FIRE CONTROL.

The latest practice in turret design and operation has been made available to the service in a report of the Fire Control Board, completed last June. This embodies the results of war experience, and provides the service at large, and the bureaus concerned, with a detailed statement of the department's policy as to the standard installation of instruments and the standard practice of fire control.

PLANS TO ESTABLISH A CALIBRATION RANGE.

Plans for the establishment of a permanent calibration range near the mouth of the Potomac River have been prepared. It is intended to use this range for the calibration of vessels' batteries, and for experiments to ascertain the causes of errors in gunfire from guns mounted on ships. Heretofore unsatisfactory temporary ranges in Chesapeake Bay and in Cuban waters have been used for this purpose. The establishment of a permanent range will save expense, expedite the work, and improve results.

STUDYING CAUSE OF ERRORS IN GUNFIRE.

Exhaustive experimental firing to determine the cause of errors in gunfire were conducted with the *New Mexico* in October, 1918. In this firing the Navy Department availed itself of the services of expert physicists, provided by courtesy of the Bureau of Standards, Department of Commerce, who performed highly technical and valuable work in the measurement of certain factors in the ballistic problems investigated.

NAVY BROUGHT HOME 1,686,944 UNITED STATES TROOPS.

With the end of hostilities our work in troop transportation was only half completed. We were faced with the tremendous task of transporting back to this country the 2,000,000 American soldiers in Europe. British and other foreign ships which had carried to France a large portion of our troops were no longer available. The brunt of the burden was borne by the Navy, and its troop-carrying

capacity had to be increased in every way that could be devised in order to bring back the American Army in the shortest possible time.

The energy and efficiency with which this task was performed are evidenced by the fact that by the end of July, 1919, 1,770,484 troops had been returned to America, of which 1,518,149 were brought over in United States transports. The total number returned up to October 1 was 1,945,367, other ships, American and foreign, bringing back 258,423, and vessels manned by the Navy transporting 1,686,944. Of these, all but 12,211 have been returned since the armistice. And this was accomplished without the loss of a single life due to the hazards of the sea, paralleling the record made during war time of transporting hundreds of thousands of American troops without the loss of a man aboard a United States troopship on the way to France. The country may well feel proud of this achievement, and the highest praise is due the officers and crews whose splendid efficiency and devotion to duty produced these results.

CAPACITY OF TROOPSHIPS INCREASED.

In providing for return of troops, the first step taken was to increase the carrying capacity of vessels to the utmost limit consistent with safety and proper sanitation. This was done in all the vessels of the transport force, and following are examples of what was accomplished in providing accommodations for more troops:

Leviathan, increased from 10,000 to 12,000.

America, increased from 4,900 to 7,000.

Agamemnon, increased from 3,300 to 5,600.

George Washington, increased from 3,500 to 6,700.

Orizaba, increased from 3,100 to 3,900.

Siboney, increased from 3,100 to 3,900.

This work was carried on as opportunity offered and without delaying the movements of the vessels concerned. The changes necessary were planned by a joint Army and Navy board, and carried out under the direct supervision of the staff of the Cruiser and Transport Force. These involved the installation of "standees"; increase of ventilation, toilet and galley facilities, and life-saving equipment. The greater capacity resulted in a very material saving in time and expense. Troops were necessarily crowded and deck space for airing and exercising limited, but in no case was this carried to the extent to justify serious complaint.

BATTLESHIPS AND CRUISERS CARRIED TROOPS.

To assist in carrying out the broad policy of the Government to use every American vessel available for repatriating troops, in December the battleships of Battleship Force No. 1 (15 vessels)

and the cruisers (10 vessels), were assigned to the transportation of troops. The battleships were fitted out to carry an average of 1,100 troops and the armored cruisers about 1,750. The former were operated on a 40-day, and the cruisers on a 30-day schedule. These vessels continued in operation until the fleet was reorganized and there was no longer any urgent necessity for their use.

WARSHIPS USED TO TRANSPORT TROOPS.

The battleships and cruisers employed in troop transportation brought back more than 145,000 men, as follows:

Battleships.—*Connecticut*, 4,861; *Georgia*, 5,869; *Kansas*, 7,486; *Louisiana*, 4,714; *Michigan*, 1,052; *Minnesota*, 3,955; *Missouri*, 3,278; *Nebraska*, 4,530; *New Hampshire*, 4,900; *New Jersey*, 4,675; *Ohio*, 778; *Rhode Island*, 5,303; *South Carolina*, 4,501; *Vermont*, 4,795; *Virginia*, 5,784; total, 78,788.

Cruisers.—*Charleston*, 7,704; *Frederick*, 9,659; *Huntington*, 11,913; *Montana*, 8,800; *North Carolina*, 8,962; *Pueblo*, 10,136; *Rochester*, 317; *Seattle*, 9,397; *South Dakota*, 3,463; *St. Louis*, 8,437; total, 66,481.

EMERGENCY CALLED FOR EXTRAORDINARY MEASURES.

The utilization of fighting ships as transports was a new employment for them, but the soldiers and the people at home were anxious for quick return of the troops abroad, and it was the plain duty of naval administration to hasten their return in every way possible. Upon the signing of the armistice there was a fear that amounted to a dread that it would require two years for American ships to bring back American soldiers. The emergency clearly called for extraordinary measures. These fighting ships were not built to act as transports and were not fitted for such service. There were able naval officers who thought such use was not to be considered, much less carried out. To be sure they were right in saying it was not a naval function and that it would interfere with the training of men and the temporary efficiency of the ships for battle. They feared also that the troops might be uncomfortable and object to this character of transportation across the Atlantic.

NAVAL OFFICERS GLAD TO AID FELLOW SERVICE.

The immediate duty, however, which the Navy felt imperatively called upon to perform was to bring back the troops as quickly as they were carried over. This was possible only by making ocean ferryboats out of battleships of the class built before the dreadnaughts and armored cruisers. With reduced crews these ships were enabled to transport thousands of American soldiers, and the officers of these ships and the department received thanks from the men of the sister service, who were glad to add to their experience the

pleasure of coming home on battleships. It was a distinct service, rendered at a time when transportation from Europe was limited and needed immediately above everything else. In this, as in a score of other ways that were removed from its ordinary functions, the Navy proved that it was as versatile in the character of its usefulness as it was fit and ready in the special naval duties which devolved upon it.

To have been able, in addition to manning transports, to have placed fighting ships at the convenience of the men of the Army was a pleasure. That it was appreciated by the Secretary of War and the officers and thousands of men who were thereby enabled to come home earlier than otherwise is compensation enough for the new departure. In war, and in peace as well, the organization that is not flexible enough to render every service of which it is capable fails to measure up to its high duty.

FIFTY-SIX CARGO VESSELS CONVERTED INTO TRANSPORTS.

Fifty-six vessels, mostly of the cargo type, were taken over and converted by the Army, under Army contract and supervision, for the transportation of troops. These were not particularly well fitted for this duty and naturally it was the desire, in order to keep down the cost, to make as few changes as possible in their structural arrangements. The officer-carrying capacity of these vessels was very small, but by carrying some officers in standees it was possible to transport sufficient officers with the troops to maintain the necessary discipline.

Soon after these vessels were taken over by the Army, they were commissioned in the Navy and assigned to the transport force. During the period of conversion close liaison was maintained between the Army and the Navy in the work of fitting out and inspecting these vessels in order that they might be suitable for use as transports. A special office was organized to which were attached several naval officers of transport experience to maintain the necessary liaison with the Army, and the two services worked in cordial co-operation.

The majority of the officers on these vessels were enrolled in the Naval Reserve and continued in their same positions when the ships were commissioned. On a few of the larger vessels it was considered advisable to place regular officers in command until the reserve officers had been indoctrinated with the methods of the Navy and the transport force. These reserve officers quickly absorbed the spirit of the Navy and realized the mission they had to accomplish, and they deserve high praise for their excellent work and devotion to duty.

NINE BIG GERMAN SHIPS EMPLOYED.

Following the armistice, an interallied commission took over from Germany certain German passenger vessels which were in the ports of Germany during the war. Nine of these large vessels, the *Imperator*, *Kaiserin Augusta Victoria*, *Prinz Friedrich Wilhelm*, *Zeppelin*, *Cap Finisterre*, *Graf Waldersee*, *Patricia*, *Pretoria*, and *Mobile*, were transferred to the Government of the United States and assigned for conversion and operation as troopships. These ships were taken over in French or English ports from the Germans, were manned by naval officers and crews who had been on duty at the various bases abroad, and delivered to American ports for conversion. The first to arrive at New York was the *Kaiserin Augusta Victoria* on April 19, 1919, and the others followed at short intervals. The terms under which they were used prohibited any extensive structural changes in the vessels, so that their conversion consisted in installing standees in cargo and other available spaces; necessary ventilation, galley facilities, the provision of hospital and other accommodations.

"IMPERATOR" FITTED OUT IN TEN DAYS.

The conversion of these vessels was done at the navy yards and by private contractors. The naval personnel concerned was determined to make a record in preparing these ships for service, and a vast amount of work was accomplished in a remarkably short time. These vessels were converted in an average of less than 14 days—the giant *Imperator* was in 10 days fitted out to carry 9,000 troops and 1,400 first-class passengers—and the cost per troop was about \$40 for material, labor, and overhead charged. The cost-plus system for all work done showed a marked advantage over the system that was required in converting the cargo vessels, of drawing up specifications and letting the contract for a lump sum to the lowest bidder. The average time in port of the cargo vessels under conversion was 75 days, and the cost per troop was about \$78. The cost-plus system, which had been used in the conversion, repair, and maintenance of the transport force during the war, had demonstrated its marked superiority over any other system for rapid work and economy in the emergency. The nine German vessels employed were converted to a total carrying capacity of 3,997 officers and 39,132 men.

MADE NEW RECORDS IN QUICK TURN-AROUNDS.

The personnel of the Transport Force were indoctrinated with the necessity of making the quickest possible turn-around in order to bring back the maximum number of troops in the shortest time. A maximum lay-over of three days in a foreign port and seven days in

a home port was set, but vessels quickly began to reduce this time, and competition became keen to arrive in port, unload, load, repair, and get to sea again as quickly as possible. Little opportunity was given the officers and crews for liberty on shore, either abroad or at home, but they accepted this condition uncomplainingly.

340,946 BROUGHT BACK IN ONE MONTH.

After January 1, 1919, troop movements gradually increased and the number carried grew from month to month until the maximum was reached in June, when 340,946 men embarked from France, 314,167 of them in United States transports. This exceeded the maximum carried overseas by all American and allied vessels in any one month during the war. When the troop movement reached its highest point, the average cycle of troop transports was 25 days, and of the converted cargo vessels about 35 days. For certain 10-day periods, the average cycle of the former reached the low level of 21 days, and the latter 29 days. It was anticipated that the troop transports would require approximately a 30-day cycle, and the ex-cargo vessels a 40-day cycle, but the rapidity of loading troops in France, and of repair, provisioning and coaling, made it possible to reduce materially the estimated time.

142 VESSELS USED IN TROOP TRANSPORTATION.

The maximum number of vessels assigned to and operated by the Navy for the transportation of troops was 142, with facilities for carrying 13,914 officers, and 349,770 men.

TRANSPORTED MORE THAN 2,500,000.

When it is recalled that 911,047 men were carried to Europe in United States Navy transports before hostilities ended, November 11, 1918, it will be seen that the total number the Navy transported was more than two and one-half millions. The latest available figures are 2,597,991. More than 150,000 sick and wounded were returned on our transports and hospital ships under care of Navy surgeons and hospital corpsmen. Of the 2,079,880 men of the American Expeditionary Force taken to France previous to the armistice, the numbers and percentages of the total carried in the various classes of vessels were:

	Number.	Percentage.
United States Navy transports.....	911,047	43.75
Other United States ships.....	41,534	2.50
British ships.....	1,006,987	48.25
British-leased Italian ships.....	68,246	3.00
Other foreign ships, French, Italian, etc.....	52,066	2.50

As is shown by the above table, 952,581 were carried in American vessels—46.25 per cent of the total transported.

EFFICIENCY OF FORCE STEADILY INCREASED.

Organized in June, 1917, with the few hastily assembled cruisers and transports that formed the first troop convoy sent to France, the Cruiser and Transport Force grew rapidly and its efficiency steadily improved as experience was gained. When it became evident that a large American Army must be put into the field in France early in 1918 if the war was to be won, every effort was put forth to increase the troop-carrying capacity of vessels to the maximum. This was done during the time of layover in American ports and without delaying sailings.

Additional destroyers having been sent to Europe for escort duty, it became possible to sail medium speed (13 to 14 knots) troop convoys from New York at seven-day intervals and fast troop convoys (15½ knots and above) at five-day intervals. With reduction in turn-arounds, this meant ability to carry many more men in a given time.

SUBMARINE RAIDS NECESSITATED MORE ESCORT.

From the beginning of the fiscal year, July 1, 1918, Squadron 1, Cruiser Force, was engaged in escorting troop transports and the fast merchant convoys from New York. Squadron 2 continued escorting medium-speed merchant convoys out of New York and Newport News at regular eight-day periods.

With the beginning of enemy submarine operations on this coast in the summer of 1918, the previous exacting duties of the cruisers were increased by the necessity of escorting transports from Newport News until they joined up at the rendezvous with the New York section of the group. This required cruisers to be held at Hampton Roads for the escort of the Newport News section of the group. When these two sections formed their junction at sea, the cruisers that had escorted the Newport News section proceeded to New York for liberty and overhaul.

BATTLESHIPS SERVED AS RAIDER GUARDS.

Reports having been received of expected raids by enemy battle cruisers, the battleships of Squadron 2, battleship force, were assigned to escort duty as raider guards. The *South Carolina* sailed on September 9, 1918, as the escort for British convoy No. 48, and the battleships of this squadron continued to escort the troop and fast merchant convoys until the danger of raiders was considered over. The utmost protection, by cruiser and destroyer escort and

every other possible means, was given troopships during the entire period of hostilities, and discontinued only when there was no longer any danger of attacks or enemy activity.

In the six weeks after the armistice advantage was taken of this period of reduced activity to give certain vessels, including the *Leviathan*, *Agamemnon*, *Great Northern*, *Kroonland*, *Harrisburg*, *Von Steuben*, and *Aeolus*, extended overhaul, of which they were much in need. With the beginning of the present year troop transportation increased rapidly until July, by which time most of the American Army had returned. As the need for their use ceased, vessels employed as transports were returned to the Army, Shipping Board, and private owners and the transport force reduced. On September 1, 1919, Admiral Albert Gleaves, who had been in command from the formation of the force, was detached to command the Asiatic Station, and was succeeded by Rear Admiral C. B. Morgan.

CRUISER AND TRANSPORT FORCE LOST ONLY FIVE VESSELS.

During the entire period of its operations, the Cruiser and Transport Force lost only five of its vessels—the transports *Antilles*, *President Lincoln*, and *Covington*, sunk by submarines while returning from France; the cruiser *San Diego*, sunk by a mine near Fire Island, off the coast of New York, and the transport *Tenadores*, stranded in French waters in a storm December 28, 1918. The *Finland* and the *Mount Vernon* were torpedoed near the French coast while homeward bound, but reached port and were repaired. The *Northern Pacific* ran aground on Fire Island January 1, 1919, but the troops she carried were taken off without loss and the steamer later was floated, taken to port, repaired, and put back into service.

When we take into consideration the conditions under which its work was performed, the constant menace during hostilities of submarine attack, and the perils of navigation, we can truly say that this force made a record that has never been excelled.

NAVY OPERATED VAST FLEET OF CARGO SHIPS.

The Naval Overseas Transportation Service, established in January, 1918, to transport supplies for our military and naval forces overseas, grew into the largest service of the kind in existence, comprising 490 cargo vessels of 3,800,000 dead-weight tonnage, more than the combined fleets of the largest trans-Atlantic lines before the war. Of this number 378 vessels (2,900,000 dead-weight tons) were in actual operation by December, 1918, the remainder being in course of construction, or being prepared for commissioning. The growth of "N. O. T. S.," as it was popularly termed, was remarkably rapid. Created when the Navy was called upon to man many vessels of the

Shipping Board and Army for which crews could not be provided from the merchant marine, it grew in half a year to 198 vessels, which number was nearly doubled in the succeeding six months. Six million tons of cargo, in round figures, were transported, including all kinds of supplies and munitions for our own forces and those of our allies; commercial cargoes needed at points where tonnage was unavailable or insufficient, and substantial aid given to the Food Administration in carrying provisions to distressed regions of Europe where relief was urgently needed.

FORCE OF 4,672 OFFICERS AND 29,175 MEN.

A force of 4,672 officers and 29,175 men was required to man and operate this immense fleet, and a large organization, with port headquarters at New York, Baltimore, and Newport News, had to be built up to supervise its operation. The crews, composed largely of Naval Reserves, proved notably efficient. Armed with naval guns, equipped for defense, these vessels sailed for France in convoys, braving the dangers of the war zone, and in numerous encounters with submarines, officers and men proved their vigilance and courage, exemplifying the best traditions of the Navy.

VESSELS RAPIDLY RETURNED TO OWNERS.

Demobilization was begun immediately after the armistice, vessels being turned over to the Army, the Shipping Board, or private owners. As their need in war service ceased, the ships were demobilized as rapidly as they could be surveyed and merchant crews obtained. By July 1, 1919, only 100 remained, and practically all these have since been returned.

During the period of demobilization the vessels remaining in service were engaged in carrying supplies for the Army and Navy to and from Europe, in carrying cargoes of food to Europe for the Food Relief Commission, and certain vessels operating for the account of the Shipping Board carried to various ports of the world commercial cargoes that were urgently needed. Many of the larger vessels were converted into troop transports and utilized in bringing troops from France.

FIRST TO FLY ACROSS THE ATLANTIC.

That dream of aviators, flight across the Atlantic, has at last been achieved, a United States Navy seaplane being the first craft to make the voyage through the air from America to Europe. On May 26, 1919, a huge flying boat swung into view of thousands of watchers who lined the shore at Lisbon, Portugal, and, circling over the harbor, descended to its mooring. It was the NC-4, Lieut. Commander

Albert C. Read commanding, and its arrival there marked the accomplishment of the first trans-Atlantic flight. Royally received by the Portuguese authorities and people, the NC-4, after three days in Lisbon, left for England, arriving May 31 at Plymouth, the port from which the Pilgrims sailed for America 300 years ago. Completing the voyage of 4,500 miles, Lieut. Commander Read and his crew were given a welcome worthy of pioneers who had led the way in trans-ocean navigation of the air.

While to the aviators who manned the flying boats this flight was "life's great adventure," the Navy had planned it not as a feat of dash and daring, but as a scientific undertaking to demonstrate the possibilities of aerial navigation and work out in practice the untried problems of overseas aviation.

HUGE SEAPLANES PLANNED IN 1917.

As long ago as September, 1917, Rear Admiral David W. Taylor, Chief of the Bureau of Construction and Repair, ordered that designs be prepared for a flying boat large and powerful enough to fly across the ocean under its own power; capable of going far out to sea on patrol duty, or of bombing distant enemy bases and returning without refueling or descent. In designing such a seaplane, far larger than any then in existence, many difficulties were encountered, but these were, one by one, overcome. The perfection of the Liberty motor furnished the large motive power required, making possible a lifting capacity of 25,000 pounds. With the cooperation of the Bureau of Steam Engineering, in October, active work was begun on the plans, which were completed in January, 1918, and contracts were made for the building of four of these planes. The first was completed in September, 1918, and a test flight made on October 4. Though, on the whole, the machine performed satisfactorily, several changes were found desirable. These were made, and thorough tests, under all conditions, were conducted, the plane meeting them successfully. In December the NC-1 carried up 51 passengers in a flight at Rockaway, N. Y. With the completion of the other three boats contracted for, the Navy was prepared, as early in the spring as weather conditions were favorable, to undertake the flight across the Atlantic.

SEAPLANE DIVISION ORGANIZED IN FEBRUARY.

Orders were issued in February for the organization of NC Seaplane Division 1, to which experienced aviation officers and men were assigned, and active preparations begun. Special navigational and meteorological instruments, several of them invented or adapted by Navy experts, were perfected, and used for the first time on this flight.

Every precaution was taken to insure the success of the undertaking. Battleships and destroyers were stationed at intervals of about 75 miles along the entire route to take meteorological observations and report weather conditions. The United States Weather Service gave hearty cooperation, not only in frequent reports, but also in equipping ships with instruments.

CREWS WERE READY—GUARD-SHIPS AT STATIONS.

The naval air station, Rockaway, N. Y., was chosen as the base and three of the four planes constructed were prepared for the flight. By the beginning of May they were in condition, only awaiting propitious weather to start on the long journey. Commander John H. Towers was placed in command of Seaplane Division No. 1, with the *NC-3* as his flagship; Lieut. Commander Albert C. Read was given command of the *NC-4*; Lieut. Commander Patrick N. L. Bellinger, of the *NC-1*. The route selected was: From Rockaway to Halifax, Nova Scotia; Halifax to Trepassey Bay, Newfoundland; Trepassey to the Azores; Ponta Delgada to Lisbon, Portugal; Lisbon to Plymouth, England. The actual trans-Atlantic crossing was from Trepassey to Lisbon, but it was decided to fly the boats from New York to Trepassey rather than ship them, as it was believed that the lessons learned in this 1,150-mile preliminary flight would be of great value in the trip to Europe.

Prior to the start of the flight the destroyers left port and took their positions along the route, to act as guide posts, furnish weather reports and communication by radio, and render any assistance needed.

FLEW FROM ROCKAWAY, VIA HALIFAX, TO TREPASSEY.

On the morning of May 8, 1919, the three giant planes took the water at Rockaway Naval Air Station, the flagship, *NC-3*, leading off at 9.59 o'clock, and the other two following at intervals of a minute. After "taxiing" through the water a few moments, all three planes swung into the air for the long journey. The *NC-3* and *NC-1* proceeded without difficulty to Halifax, arriving there before dark. Off the Massachusetts coast the *NC-4* developed trouble in oil feed. Descending about 80 miles east of Cape Cod, she remained on the water all night, taxiing under her own power to the naval air station at Chatham, Mass., where she arrived early the next morning. The *NC-1* and *NC-3*, after two days at Halifax, proceeded to Trepassey, where the machines were given their final tests and tuned up for the Atlantic voyage. Bad weather caused several days' delay and in the meantime the *NC-4*, having completed repairs, left Chatham on May 14 for Halifax and proceeded the next day to Trepassey.

ON THE LONG "JUMP" TO THE AZORES.

It was the evening of May 16, a few minutes after 6 o'clock, when the three planes, carrying every ounce of weight their four powerful engines could lift, swung out into the waters of the bay and taxied off for the start. Nosing up as the speed neared the flying point, leaving a white foam in their wake, the trio quickly took the air and began to climb. With the flagship, *NC-3*, in the van, followed closely by the *NC-4* and *NC-1*, the planes headed for the southeast on the long "jump" to the Azores.

Sailing along through the air, sometimes in sight of each other, but for the most part alone in a boundless expanse of sea and sky, each plane navigated independently. Now and then a destroyer, a tiny spot on the spreading ocean below, would be sighted, located at first by the smoke columns that poured from her funnels and, as night came on, by searchlights or star shells, some of which were seen 50 miles away. Thus the aerial navigators were able to check their calculations and determine whether they were keeping to their course.

RAN INTO THICK FOG NEAR AZORES.

All through the night, running not far apart, the three planes winged their way over the sea, the station ships below whisking by, one by one. Just when the flyers began to feel that the goal was within their grasp and they could safely negotiate the 1,380-mile flight, the dread foe of navigators appeared. Fog, so dense that it all but blinded the pilots and so widespread that it was almost impossible to sail under or surmount, was encountered. Now all the skill of the aviators, tense with the strain of long hours of continuous flying, was called into play, for not only was the success of the flight at stake, but life itself in the balance.

"NC-4" REACHES HORTA—TWO OTHERS DESCEND.

The *NC-4* managed to ascend above the fog, and 15 hours and 13 minutes after leaving Newfoundland arrived at Horta, the emergency stop in the Azores. Fifteen minutes before, the *NC-1* was forced to descend to the water at a point 45 miles on the other side of the island of Flores, and about half an hour later the *NC-3* also descended at a point about 35 miles from the island of Fayal.

ATTEMPTS TO TOW DISABLED "NC-1" FAILED.

Soon disabled by the heavy seas, the *NC-1* was sighted, after five hours on the water, by the steamer *Ionia*, and Lieut. Commander Bellinger and the other members of the crew were taken aboard and landed safely at Horta. Pounded by heavy seas, the *NC-1* was

badly damaged, and the crew worked desperately to keep it afloat until help arrived. Repeated attempts to tow the plane failed. Destroyers went to her assistance, but she sank while they were trying to get her to port.

"NC-3," ON THE WATER THREE DAYS, TAXIED TO PORT.

When the *NC-3*, caught in the fog, descended to the water, she encountered heavy seas. Rain squalls occurred during the night and the next morning she had to face a gale. Destroyers were searching for her, but her radio apparatus failed, and she could not flash them her location. After tossing on the ocean for a day and night, the morning of May 18 her port wing pontoon was suddenly carried away, and men had to be placed on the starboard wing tip to keep the port wing clear of the water. The high seas soon afterwards began to break the ribs of the lower plane and split the fabric. A steep wave lifted the bow and forced under the water the lower elevator, which began to disintegrate and was finally swept off. The cables of the sea anchors parted. The hull was leaking badly, and the pumps had to be kept going.

The sun came out and the top of Mount Pico was sighted, showing that land was only 35 miles away. But the 60-mile wind and heavy seas made hopeless any attempt to reach Pico, and it was decided to endeavor to work toward San Miguel. Taking advantage of every lull in the waves and making a course slightly across the wind, by the use of ailerons and rudder, some progress was made, increasing as the pilots gained experience in this untried navigation. The heavy wind and seas continued throughout the night, and by daylight practically nothing was left of the lower wings except the beams, heavy wings between struts and the starboard wing pontoon.

TAXIED TO PORT UNDER HER OWN POWER.

Early in the morning San Miguel was sighted, and the course was changed toward Ponta Delgada. When 7 miles off the harbor the plane was sighted from shore and thirteen minutes later the destroyer *Harding* came into sight, standing out at full speed. Her offer of assistance was refused, the *NC-3* proceeding under her own power. A few minutes later a cross-sea swept off the starboard pontoon, which, dragging in the water, almost capsized the seaplane. But by keeping men ready to run out on the wings and using the three available engines, the *NC-3* taxied to her mooring, reaching Ponta Delgada at 4.50 p. m., having been on the water for 53 hours, drifting and taxiing 209 miles in the endeavor to reach port. Officers and crew had suffered hunger as well as other hardships, for their sandwiches had fallen in the bilge when the plane descended, and the

crew subsisted almost entirely upon a few cakes of chocolate, as the emergency rations created extreme thirst, and the radiator water, all they had left to drink, was very unpalatable. But the aviators were in good spirits, in spite of their distressing experiences.

REJOICING AT PONTA DELGADA WHEN AVIATORS ARRIVED.

Ships in the harbor were dressed, the town of Ponta Delgada decked in flags, and there was general rejoicing at the arrival of the lost aviators. A salute of 21 guns was fired by the Portugese battery. Taken to Admiral Jackson's headquarters, Commander Towers and his crew were officially welcomed by the Governor of the Azores and the Mayor of Ponta Delgada.

PONTA DELGADA TO LISBON IN 9 HOURS 43 MINUTES.

Delayed at Horta three days by bad weather, the *NC-4* on May 20 flew to Ponta Delgada. There she remained nearly a week, waiting for favorable weather conditions. Early in the morning of May 26 she departed for the 891-mile flight to Lisbon, arriving there safely before dark. Two heavy rain squalls were encountered, but the plane proceeded steadily, making the run in 9 hours 43 minutes.

LISBON GAVE "NC-4" A ROYAL WELCOME.

Lisbon turned out en masse to receive the aerial voyagers, the thousands lining the water front cheered as the seaplane hove in sight, bells rang, whistles blew, and the guns of the shore batteries boomed to welcome the *NC-4*. Lieut. Commander Read and his crew were paid every honor by officials and citizens, and decorations were conferred upon them.

Remaining at the Portuguese capital three days, the *NC-4* departed on May 30 for England, on the last leg of the flight. Circling over the city, the plane stood out for Cape Roca. Dodging several small squalls and encountering rain, a leak developed in the port engine, and the plane headed toward land, hunting for smooth water in which to descend. She landed in the Mondego River, near Figuera, and soon completed repairs, but the sand bars prevented getting away until high tide, and in the afternoon she flew to Ferrol, Spain, where she remained for the night.

VOYAGE ENDED IN PORT FROM WHICH PILGRIMS SAILED.

The next morning, May 31, she departed for England, flying across the Bay of Biscay, circling over Brest, and, in spite of thick weather, proceeding swiftly reached Plymouth at 2.26 p. m. The long flight of 4,500 miles across the Atlantic and up the European coast was

ended at the port from which the *Mayflower* had sailed three centuries before. Received with the utmost enthusiasm, the aviators proceeded to London, where they were paid high honors, and presented to the King, the Premier, and other officials, who tendered their hearty congratulations. They also proceeded to Paris, where they were entertained by French officials and officers of our own and other navies.

The reports of the commanders of the NC planes, which are of present and historic interest, are printed as Appendix G of this report.

BRITISH AVIATORS MAKE FIRST NONSTOP FLIGHT ACROSS OCEAN.

The world was still ringing with the achievement of the *NC-4* and the daring exploit of Harry B. Hawker, the Australian who attempted to fly from Newfoundland direct to England in a light, speedy land plane, when it was again thrilled by the news that Capt. John Alcock and Lieut. Arthur W. Brown, in a big British bombing plane, had flown from Newfoundland to Ireland in 16 hours, making the first nonstop flight across the Atlantic.

HUGE AIRSHIP CROSSES ATLANTIC AND RETURNS.

Six weeks later, in July, the huge British rigid dirigible *R-34*, Maj. G. H. Scott commanding, made the voyage from England to America and return, the first round trip across the Atlantic. Arriving at Mineola, N. Y., July 6, after a voyage of 108 hours 12 minutes, she remained until midnight July 9, making the return voyage in much quicker time. One of our own naval officers, Lieut. Commander Zachary Landsdowne, by invitation accompanied the crew of the *R-34* on her trip to America. This airship, as large as an ocean liner, 643 feet long, with an over-all height of 92½ feet and of 2,000,000 cubic feet capacity, created great interest among our own aviators, and her voyage demonstrated the possibilities of dirigible balloons in transocean navigation.

AIRSHIP OF LARGEST TYPE PURCHASED BY THE NAVY.

The importance of bringing our own lighter-than-air craft up to the high state of development reached in England and Germany is thoroughly realized by all who are interested in aeronautics, and we are making every effort to that end. None of the modern rigid-type airships having been built in this country, we have succeeded in purchasing from the British Government one of the largest type, similar to, but larger than the *R-34*, which will soon be brought to America.

The same legislation which authorized the purchase of this airship abroad also made appropriation for the construction in this country of an airship of the largest type, which will be built as rapidly as possible.

BUILDING HUGE HANGAR AT LAKEHURST, N. J.

To accommodate this airship and others to be built, we are erecting at Lakehurst, N. J., a hangar of unprecedented size, for both construction and storage purposes. Plans and specifications were prepared and contracts awarded by September 8 for a building 804 feet long, 318 feet wide, and 200 feet high, with a frame of structural steel built on the three-hinged arch truss principle, each arch supported on steel towers 62 feet high.

The entrance door is double, consisting of two leaves, each 177 feet high and 136 feet wide, framed in structural steel and braced to a thickness of 76 feet at the bottom. Special railway track is provided as a runway for these immense portals. When fully opened, their upper contour forms an unbroken arch outline with the roof of the building, and the whole arrangement provides a windbreak nearly 600 feet wide, insuring a large degree of safety in landing and releasing the ships. The magnitude of these doors can be better grasped when it is stated that a 12-story building with a frontage of 135 feet could be placed within the hangar through the space covered by either leaf, with clearance to spare all around.

WILL ACCOMMODATE AIRSHIPS LARGER THAN ANY NOW BUILT.

The body of the structure will accommodate two dirigibles of 5,000,000 cubic feet capacity, each more than twice as large as the celebrated *R-34*, or one dirigible of 10,000,000 cubic feet capacity. Overhead trolleys are provided for the construction of airships, and three docking rails of special design for landing, releasing, and mooring purposes extend throughout the length of the building and for 1,500 feet in front. The two standard-gauge railway tracks occupy similar spaces. The hangar is expected to be in service by next summer.

HELIUM PRODUCTION PLANT ERECTED IN TEXAS.

A large helium plant has been erected at Fort Worth, Tex., and this is of vital importance in lighter-than-air craft, as the exploitation of helium as a flotation agent for dirigible balloons has been a most interesting war development. This gas, formerly very rare and expensive, is nearly as buoyant as hydrogen and less combustible than asbestos. It is the one unique balloon-filler known. Fortunately, it exists in workable quantities in the natural gases of north Texas.

The helium plant is, as the name suggests, for the production of helium commercially. The work will cost, when completed, approximately \$5,000,000. The plant takes the natural gas, from

which helium is extracted, through a pipe line 96 miles in length. The production of 40,000 to 45,000 cubic feet per day is contemplated.

This output is to be distributed to the various air stations in steel cylinders, each having a capacity of 180 cubic feet of free gas. Such a capacity is thought to be sufficient to furnish supplies of helium to our entire dirigible fleet as needed. A study is now being made of an additional stage in the refining plant to repurify used helium after diffusion has occurred in use, which should result in a very desirable economy.

NAVY "BLIMPS" MAKE NEW WORLD RECORDS.

While we have constructed no airships of a size comparable to the *R-34*, we have succeeded in the highest development of the nonrigid dirigibles, popularly called "Blimps," which during the past year have made new world records in both endurance and distance flights. Had it not been for the unfortunate accident which resulted in the loss of the *C-5*, we might have won the honor of the first crossing of the Atlantic by lighter-than-air craft.

"C-5" MADE FLIGHT FROM MONTAUK TO ST. JOHN'S.

While the NC planes were at Trepassey last May, the dirigible *C-5* Lieut. Commander Emory W. Coil commanding, established a world's record for a nonstop flight for airships of the nonrigid class, flying from the naval air station, Montauk, Long Island, to St. John's, Newfoundland, a distance of 1,050 nautical miles, in 25 hours and 50 minutes. Soon after she arrived a heavy gale sprang up suddenly, and, despite all efforts made to hold her or deflate the bag, the big balloon was torn from its moorings and swept out to sea. Destroyers and other vessels searched the area for days, but no trace of the missing dirigible was found. The trip to St. John's and previous tests indicated that the *C-5* could successfully have negotiated the trans-Atlantic voyage.

"F-5" FLYING BOAT IN AIR 20 HOURS 10 MINUTES.

On April 25, 1919, a twin-motored flying boat of the *F-5* type, fitted with two direct-drive, high-compression Liberty engines, made a nonstop flight of 20 hours and 10 minutes, during which a distance of 1,250 nautical miles was covered. This boat carried a crew of four men, and the total weight was approximately 16,200 pounds.

RADIO TRANSMITTED BY SEAPLANE 1,400 MILES.

Radio transmission in aircraft was greatly improved during the period of hostilities. On the trans-Atlantic flight two-way com-

munication was maintained with a shore station over a distance of 700 miles. One seaplane was heard at the Bar Harbor, Me., receiving station from a distance of 1,400 miles.

Telephoning by wireless to and from aeroplanes has been successfully accomplished, in some instances at a distance of 150 miles. It is now easily practicable to telephone from land to seaplanes in flight a considerable distance from shore.

NEW NAVIGATIONAL INSTRUMENTS AND METHODS.

A number of the new navigational instruments, recently invented or developed, were used for the first time in the trans-Atlantic flight. These include an aerial sextant, by means of which the aviator can calculate his position by sun or star observation; a drift and speed indicator by which, sighting on flame and smoke bombs dropped into the water, the velocity and direction of the wind may be determined; and a course-and-distance indicator.

New methods have also been devised by which the navigator can make his astronomical calculations in a fifth of the time formerly required. For this purpose a zenithal projection chart of the Atlantic was constructed, making unnecessary difficult mathematical calculations, and enabling the aviator to determine his position in a few minutes.

PROVIDES SWIFT MEANS OF TRANSPORTATION.

The trans-Atlantic flights, in which British and American aviators vied with each other in glorious achievement; the flight from New York to San Francisco and return by Lieut. Belvin W. Maynard and other Army aviators; the notable advance in aircraft of all types; the acquisition, through war experience, of thousands of trained aviators; the operation of mail and passenger planes—all these point to a development that will make aeronautics a means of swift transportation, bringing continents closer together and reducing the trans-ocean voyage to hours instead of days.

NAVAL AVIATION AN INTEGRAL PART OF THE SERVICE.

This emphasizes the necessity of developing aviation as an integral part of our military and naval forces. When an airship can fly from Europe to America in a few hours, the ocean is no longer a dependable protection against possible attack. Civilian aviation should be given every possible encouragement, but naval aviation, to be effective, must be moulded into the naval service, of which it is a vital part. For this, special training is required, not only in methods of fighting and patrol, but also in naval training to insure that complete understanding between all parts of the force employed, that mutual knowledge which is a prime requisite in all military operations. Our aviation

force must be made a part of the fleet as well as an effective coast patrol—capable not only of operating from shore, but also at sea, accompanying our ships wherever they may go.

BATTLESHIPS SUPPLIED WITH PLANES.

Planes are being supplied to certain battleships, and it is the intention to equip other classes of vessels, capable of employing them, with flying machines. Our kite balloons, dirigibles, and big rigid airships will be as much a part of the fleet as its battleships, essential to its operations and vital to its effectiveness in battle. They will be the eyes and wings of the fleet. By use of tenders and vessels designed to carry planes, we can create an aviation service that may accompany the fleet and operate with it in any quarter of the globe.

FACILITIES REQUIRED AT FLEET BASES.

While some large coastal stations are essential, it is not necessary to maintain, in time of peace, any considerable number of them; but facilities for aviation activities are essential at all important fleet bases. These are especially needed on the Pacific Coast, where few at present exist. Means for the use of aircraft as an auxiliary to the Marine Corps should also be provided near the bases which the Marines maintain for their expeditionary units.

Encouragement should be given to the establishment of flying fields near cities, and these, with aircraft, should be made available for members of the Naval Reserve Flying Corps. It is to these reserves and civilian aviators we must look for recruits, in case of war, to augment our flying corps, which can readily absorb them if kept at a high state of efficiency in the service.

OBJECTIONS TO CREATING SEPARATE AIR SERVICE.

Favoring every encouragement that can be given to aviation in all phases of development and activity, I am convinced that the creation of a united air service, as a separate department of the Government, is unwise. Certainly the Navy, and I believe the Army, considers it essential to military effectiveness to retain its own aviation corps and stations. Military aviation, which has for its purpose fighting effectiveness, necessitates military training, and this differs materially in the two services. Not only does naval aviation require different types of aircraft from land aeronautics, but a different kind of training, to fit flyers for fleet operations and coast and sea patrol. Ability to fly a machine is merely the first step; pilots must be trained to cooperate with vessels, to escort convoys, to hunt submarines, and engage enemy vessels as well as aircraft.

SPECIAL TRAINING AND CLOSE COOPERATION ESSENTIAL.

Between separate services it is always difficult to secure the close cooperation that is required in military operations. By retaining aviation as a part of the Navy and Army, jealousies and clashes over command, almost inevitable where they have to depend on a separate service, are avoided. Each provides the training for its needs, and keeps in operation an organization, standardized in methods and equipment, which, in time of war merely needs to be expanded, absorbing the new personnel into a membership already indoctrinated and familiar with purposes and operations.

OFFICERS CAN ALTERNATE IN FLYING AND LINE DUTIES.

Another important point is that officers can, to some degree, alternate in duties of the regular line and those of aviation, thus familiarizing them with the Air Service, and insuring a constant exchange of ideas, a better understanding and warmer sympathy, and a higher degree of cooperation between the two branches of the service.

By retaining aviation as a part of the Army and Navy, places can be provided for the flying personnel, who can pass back into the line when their flying usefulness becomes diminished. This could hardly be done by an independent service, which would, in time, at a considerable expense to the Government, result in a large class of specialist officers available only for particular duties on the ground, and for whom there would be no really important activity. Efficiency, economy and effectiveness all appear to demand that naval aviation be conducted by the Navy.

JOINT ARMY AND NAVY BOARD ON AERONAUTICS.

A joint Army and Navy board has been created to bring about closer cooperation between the two services and consider all phases of the aviation activities of Army and Navy. This board is composed of:

Army members.—Maj. Gen. Charles T. Menoher, U. S. Army, chairman; Lieut. Col. Byron Q. Jones, A. S.; Lieut. Col. George A. Nugent, C. A. C.; Lieut. Col. Shepler W. Fitzgerald, A. S.; Capt. A. J. Clayton, A. S., secretary.

Navy members.—Capt. Thomas T. Craven, U. S. Navy; Capt. Lyman A. Cotten, U. S. Navy; Commander J. C. Hunsaker, U. S. Navy; Commander Warren G. Child, U. S. Navy.

TWO SERVICES BROUGHT INTO CLOSER TOUCH.

This board is to make recommendations for coordination of the aeronautic work of Army and Navy, in production, training, operation, selection of aviation bases and sites, purchase of material abroad, etc., and also for coordination with the aviation activities of other branches of the Government and civil organizations. A great deal

has been done toward bringing the two services in closer touch, acquainting each with the activities of the other, preventing duplication of work and installation, and utilizing, wherever possible, the facilities existing or to be established, to whichever service these may belong.

RESERVE OF 4,000 TRAINED OFFICERS AND 20,000 MEN.

As a result of war activities, naval aviation is now supplied with a Reserve Flying Corps comprising approximately 4,000 officers and 20,000 men, of which more than 2,500 of the officers are qualified naval aviators and 1,500 are aviation technicians and administrators. The enlisted personnel of the Reserve Corps has been trained for aviation duties, and, as a class, are believed to be as expert aircraft mechanics as the present state of the science can develop.

AIRCRAFT OPERATIONS WITH THE FLEET.

Relieved of the pressure of war, it has been possible to give further consideration to the broad development of naval aviation as an auxiliary to fleet operation, and a fleet air detachment was assigned to the United States Atlantic Fleet, during the maneuvers at Guantanamo, consisting of six twin-motored flying boats, three single-seater scout airplanes, and a division of kite balloons, with the U. S. S. *Shawmut* as mother ship.

USED IN SEARCH, BOMBING PRACTICE, AND SPOTTING.

The detachment served with considerable success. The flying boats were used for search problems, bombing practice, and spotting. Spotting for the fleet was also done by land-type machines with marked success. Kite balloons were used from battleships. Certain of the battleships have also been supplied with flying machines mounted upon the ships' turrets, from which they are launched.

METEOROLOGY UTILIZED—GENERAL STUDY OF THE UPPER AIR.

The war has shown the importance of securing and dispensing reliable meteorological data to ships and stations concerned with aeronautical work. Pilots will require weather reports covering a wide area before commencing flight. Steps are being taken to make meteorological work an effective part of aviation, and cooperate with the Army and the Weather Bureau in a general study of the upper air.

NAVAL AIRCRAFT FACTORY A PERMANENT ASSET.

In my report last year an account was given of the creation of the naval aircraft factory at Philadelphia and its subsequent enlarge-

ment to take care of the increased production program. The new 1,100-foot assembly plant, the storehouse, and office buildings have been completed, the entire plant getting into production on July 6, 1918. The total floor space available was 888,935 square feet, of which 500,000 square feet were used in manufacturing and the rest for offices and storage.

After the armistice, quantity production was stopped and the plant reorganized for its changed functions. The manufacturing facilities were reduced to occupy 180,000 square feet of space, which is sufficient to carry on repair and alteration work and the construction of new and experimental aircraft in limited numbers. The great volume of space made available by the contraction of manufacturing is being fully used for storage of excess stocks of aircraft material, including aircraft returned from abroad.

The contraction and the resulting economy is measured by the reduction in force from 3,643 on November 4, 1918, to 1,202 November 1, 1919. The total investment in the plant is a little over \$4,000,000 and the total value of the aircraft produced is about \$10,000,000.

The naval aircraft factory was built primarily as a war measure to augment the development and production facilities of the country, and as such it saved the Navy's aircraft program by producing thoroughly satisfactory flying boats at such a rate that two months before the armistice all United States naval air stations abroad were fully supplied.

TO KEEP IN FOREFRONT OF AIRCRAFT DEVELOPMENT.

With the return to peace, naval aviation faces many difficult development problems. New uses for aircraft with the fleet are seen, and the Navy must develop new and radically different types, especially adapted to peculiarly naval functions. The naval aircraft factory is available, with its seasoned organization, and is expected to play a large part in the successful solution of the problems involved in changing over from the antisubmarine aviation to aviation with and in the Fleet.

It is not unreasonable to assume that the Navy in the air will develop largely along the same lines as the Navy in the water, becoming segregated into various types for various purposes comparable to battleships, cruisers, destroyers, etc., but each type will develop steadily. For some years to come we may expect development to be very rapid. The Navy fully appreciates the present value and future possibilities of its aviation, and is pressing development to the limit.

GREW, IN WAR PERIOD, TO FORCE OF NEARLY 50,000.

The growth of naval aviation from a handful of pilots and enlisted men to a force of 48,749 was one of the notable achievements of the

war. The well coordinated system of training personnel and producing material adequate for war purposes put into effect in 1917 did not begin to show its real effectiveness until the spring of 1918. Aircraft capable of offensive work against submarines required machines of long endurance and large carrying capacity, equipped with bombs and machine guns. These had to be developed, designed, and constructed. Pilots and mechanics had to be trained for combat, keen observation, and instant action, as well as flying.

Beginning with but one regular air station, Pensacola, Fla., and a personnel of 48 officers and 239 enlisted men, naval aviation grew to a total force of 3,117 officers and 45,632 men, including Marines and men of all ratings assigned to aviation duty. On April 6, 1917, the Naval Aviation Corps comprised 43 officers and 209 men; the Marine section 5 officers and 30 men. On November 11, 1918, there were 282 officers and 2,180 men in the Marine section; 2,835 officers and 32,873 in the Naval Flying Corps, with 10,579 men of other naval ratings assigned to aviation duty.

The Navy's aviation equipment comprised 1,865 flying boats and seaplanes, 242 land planes, 15 dirigibles, 205 kite balloons, and 10 free balloons. A total of 570 aircraft had been sent abroad before the end of hostilities.

27 STATIONS, FORCE OF 18,736 IN EUROPE.

A total of 18,736 officers and men were in service abroad, as follows:

	Navy.	Marines.
Officers.....	1,237	182
Enlisted men (aviation ratings).....	8,215	1,030
Enlisted men (aviation duty, miscellaneous ratings).....	8,072	
Total.....	17,524	1,212

There were in operation 51 aviation units, including schools, detachments, patrol stations, and supply and repair bases. Twenty-seven stations were built in Great Britain, France, and Italy, despite the many difficulties, particularly of transportation, that had to be overcome in their construction.

ANTISUBMARINE OPERATIONS ITS WAR MISSION.

Naval aviation had a very definite but at the same time a limited mission during the war, being engaged mainly in antisubmarine activities—the patrol of coastal waters for submarines and mines, convoy operations, and the bombing of submarine bases. There are on record 15 instances in which submarines were attacked, and possibly damaged or sunk, through the efforts of United States naval aviators

serving in Europe. Our naval aircraft abroad made 5,691 flights, a total of 791,398 nautical miles. During the last 10 months of hostilities no convoy protected by our naval aircraft was successfully attacked.

EIGHTEEN STATIONS BUILT AND OPERATED IN FRANCE.

Our greatest aviation activity was in France, where a powerful establishment was created, and our new and inexperienced personnel built their own stations and operated them with an efficiency not excelled by our Allies on their own coasts. There were 18 stations in active operation in France—9 for seaplanes, 3 for dirigibles, 3 for kite balloons, the northern bombing group, the assembly base at Paulliac and the training school at Moutchic. The first organized unit of the American armed forces to proceed abroad was the naval aviation detachment commanded by Lieut. Commander Kenneth Whiting, which landed at Bordeaux June 5, 1917.

NORTHERN GROUP BOMBED SUBMARINE BASES.

In the summer of 1918 the northern bombing group was established in northern France, under command of Capt. D. C. Hanrahan, to assist the Dover patrol in aircraft raids over the German submarine bases at Bruges, Ostend, and Zeebrugge. Operating from its base in northern France, this group, which included a detail of Marine aviators, dropped on these U-boat bases approximately 18,000 pounds of bombs. Prior to the establishment of these American units, aviation personnel was loaned to the fifth group of the British royal air force to assist the British in bombing raids over German bases. Sixty tons of bombs, it is estimated, were dropped on enemy objectives during these operations.

ACTIVITIES IN ENGLAND AND IRELAND.

Activities in England were carried on at two operating stations and one base, with a success which exceeded expectations. Prior to the establishment of these bases, many of our pilots were attached to various air stations for training and active work with the British personnel. Thus we gained an intimate knowledge of British procedure and practice. That the services of our young men were of value was shown by the fact that as the war proceeded we were requested to supply more pilots to the British and to take over more stations.

In Ireland there were four patrol stations and one base, under command of Commander F. R. McCrary. These posts had been in commission on an average of but two months when the armistice was signed; but they had an important place in the future plans of

Allied aviation which would have been clearly evidenced if the war had continued.

AIDED ITALY IN OPERATIONS AGAINST AUSTRIANS.

Our activities in Italy, under the cognizance of Capt. C. R. Train, Naval Attaché, assisted by Lieut. Commander J. L. Callan, consisted of the training of pilots on Italian machines supplied for our uses, bombing raids carried on over the Austrian harbor of Pola, and the work of certain naval aviators as chasse pilots with the Italian aviation forces during the Austrian offensive in the fall of 1918. Our cooperation with the Italians was so successful that, had the war continued, it was planned to expand this unit to a much larger force in order to man several additional bombing stations in the Adriatic.

The moral effect upon the enemy was quite as important as the material results of our aviation enterprise abroad, and there is no doubt that it had a very positive effect upon the result of the war.

OPERATIONS IN THE UNITED STATES.

Patrol, training and experimental stations, supply and repair bases, and schools—a total of 24 naval aviation units—were in operation in the Americas. Patrol operations were carried on by American personnel at two stations in Nova Scotia, nine in the United States, and one in the Canal Zone, and the entire Atlantic seaboard and Canal Zone were patrolled.

Naval aircraft flew a total of 2,455,920 nautical miles on patrol duty over home waters during the period of hostilities, and 10,949,340 nautical miles in training during the same period.

208 NAVAL AVIATION CASUALTIES DURING THE WAR.

The total naval aviation casualties during the war were 208, of which 74 were officers. Capt. H. I. Cone, commanding United States naval aviation forces, foreign service, was seriously wounded October 10, 1918, by explosion of the torpedo which sank the British steamship *Leinster*, on which he was proceeding to Ireland, but fortunately recovered from his wounds.

DEMobilIZATION OF AIR STATIONS IN EUROPE.

Immediately after hostilities ended, steps were taken to demobilize the aviation forces abroad, and this was rapidly accomplished. Following are the air stations in Europe and the dates on which they were demobilized:

ENGLAND—

Killingholme	January 6, 1919.
Eastleigh	April 10, 1919.

IRELAND—

Whiddy Island	January 29, 1919.
Berehaven	February 12, 1919.
Wexford	February 15, 1919.
Lough Foyle	February 22, 1919.
Queenstown	April 10, 1919.

FRANCE—

Dunkirk	January 1, 1919.
Mouthic	January 1, 1919.
La Pallice	January 5, 1919.
Arcachon	January 7, 1919.
Guipavas	January 13, 1919.
Gujan	January 15, 1919.
St. Trojan	January 19, 1919.
Treguier	January 19, 1919.
L'Abervrach	January 22, 1919.
Ile Tudy	January 25, 1919.
Paimboeuf	January 26, 1919.
Le Croisic	January 28, 1919.
Fromentine	January 28, 1919.
La Trinite	February 5, 1919.
Northern Bombing Group	February 10, 1919.
Paullac	February 15, 1919.
Brest	February 15, 1919.

ITALY—

Porto Corsini	December 31, 1918.
Bolsena	January 2, 1919.

ASSISTED IN MANNING GERMAN SHIPS.

A large number of officers and men from naval aviation were retained abroad, after the stations were demobilized, and assisted in forming the crews for the German ships taken over and manned as transports for the return of troops.

DEMobilIZATION IN THE UNITED STATES.

Demobilization of naval aviation in the United States was begun soon after the armistice. Production of aircraft was curtailed and contracts for 1,728 aircraft of various types were canceled. Enrollment of additional personnel ceased and it was decided to complete the training of only those student officers and men who were far advanced and wished to qualify as pilots or mechanics. Officers and men were placed on inactive duty until the personnel was reduced to peace-time requirements, as is shown by the following statement of personnel at various periods:

	November 11, 1918.	January, 1919.	April, 1919.	July, 1919.	October, 1919.
Officers.....	2,853	2,689	1,873	701	608
Men.....	43,452	31,282	15,091	1,217	1,889

The lowest point was reached in July, and recruiting was resumed in the effort to bring personnel up to the 5,000 required for peace time.

GROUND SCHOOLS AND SIX STATIONS CLOSED.

All the ground schools were closed, excepting the Aviation Mechanics' School at Great Lakes Training Station.

The two air stations in Canada were turned over to Canadians, in accordance with terms of agreement, in December, 1918. Construction at Galveston was discontinued. The air stations at Montauk, Long Island; Morehead City, N. C.; Brunswick, Ga., and Miami, Fla., were closed; also the kite balloon stations at Marginal Parkway, N. Y., and Charleston, S. C. Naval training was removed from Akron, Ohio, and negotiations are now in progress toward selling the naval property at that place.

Sales of aircraft have been made, and are being made, in accordance with policy.

PERMANENT STATIONS—FLEET AVIATION DETACHMENTS.

The peace program of naval aviation calls for six heavier-than-air patrol stations within the coastal limits of the United States. One patrol station is being maintained in the Canal Zone. Two fleet aviation detachments are planned; one for the Atlantic Fleet exists, and the other for the Pacific will be in operation shortly.

THE NORTH SEA BARRAGE—ITS WONDERFUL EFFECTIVENESS.

The importance and value of the mine barrage in the North Sea was just beginning to be appreciated when the armistice was signed. The long and effective fight of American and allied destroyers and other craft against the German U-boats was reinforced in the summer of 1918 by the construction of the mine barrage. This antidote of the submarine began to show deadly results almost from the start, and on July 9 the British Grand Fleet at Rosyth was apprised of the disablement of an enemy submarine while attempting to cross the barrage. At the close of hostilities at least 10 submarines had been sunk in attempting its passage.

MORALE OF GERMAN NAVY SHATTERED.

It is rare in the history of wars that the naval personnel of any nation has lost its morale. In all nations there is a tradition which has guided men of the Navy to fight to the finish and, then, if victory was impossible, to go down with the ship. That was the spirit of the men in the German Navy in the early days of the war, in the battle of Jutland, in the long days of resourceful and terrible and criminal

destruction of merchant shipping by the U-boats. Age-long tradition and practice were shattered when the German sailors rebelled and the news leaked out of the deterioration of the morale of the German Navy before the Hindenburg line was broken or the acceptance of President Wilson's fourteen points and the signing of the armistice by the German Army commanders was foreshadowed. What was the culminating offensive that ended German submarine destructive efficiency and destroyed the zeal and daring of its naval men? It was the mine barrage. The destroyers had harried, punished, and sunk more U-boats than the allied forces were ready to claim. Indeed from the first they were free from making claims concerning which there could be the slightest doubt. The Germans lost 200 submarines during the war, and never had the allied naval force claimed to have sunk or disposed of so many. Their moderation in acclaiming their achievements has been recognized and approved more since the facts became known than during the anxious days of war.

FEARED MINES MORE THAN DESTROYERS.

As long as the U boats could sail out of Heligoland and make their way safely through the North Sea, except when detected by the limited number of allied destroyers, their crews felt they had a better chance than the destroyers, because they could submerge when in danger of being hit. In spite of the deadly aim and the skill and effectiveness of the destroyers, numbers of submarines did long successfully run the gauntlet. It was not until experience taught them there was no escape from the mine barrage trap that U-boat crews felt they were fighting against a deadly foe which they could not sail under or over or around. The U-boat commander found adventure in evading a destroyer. He had at least an equal chance for his ship and his crew. What chance had he against the machines of death laid at such depths as to bar egress through the North Sea? That barrage was an effective barrier in the only zone left for operation.

HESITATED TO RUN INTO DEATH TRAP.

When the men of the German Navy understood they were going into the jaws of an unseen death trap they were no longer inclined to go joyously about their business of murdering men and women by the U boat, any more than men would gaily put their heads in a halter. From the moment they knew that half a score of their submarines had been destroyed by the barrage, the morale of the German U-boat crews was lowered, and the German leaders saw that their chief hope of winning the war could no longer be entertained.

It is always difficult to assess the true value of any single military success, where so many instrumentalities are employed, other than the final one that brings decision. In this war no single battle on sea or land or in the air brought the victory. It was too immense even to produce one master overshadowing figure. The Germans pinned their faith to U boats as the decisive factor. As the last and greatest instrumentality of ending the U-boat campaign, the mine barrage across the North Sea may be regarded as among the outstanding effective contributions to allied success.

PROPOSED BY UNITED STATES IN 1917.

From the entrance of America into the World War the plan of shutting up the German submarines in their bases ("preventing the hornets from escaping from their nests," as President Wilson put it) was uppermost in the thoughts of Navy officials, naval officers, and thoughtful civilian leaders. This great barrier to the exit of the enemy submarines from their bases was conceived in concrete form in 1917, and the Navy Department proposed its construction as a joint gigantic operation by the American and British Navies. As soon as it was agreed upon, work was begun by our Bureau of Ordnance on the vast number of mines required for that purpose. Then merchant ships were acquired and converted into mine carriers under the direction of Capt. R. R. Belknap, who was in command of the new enterprise in its inception. In March, 1918, the preparations were nearly completed, and Rear Admiral Joseph Strauss was sent to Scotland to take command of the expedition, complete arrangements for laying the barrage, and carry the work forward rapidly and effectively.

STRETCHED 230 MILES FROM ORKNEYS TO NORWAY.

The eastern end of the barrier was to abut at the 3-mile limit of Norwegian waters between the latitude of Bergen and the island of Utsire, and thence stretch across the North Sea for a distance of 230 miles to within 10 miles of the Orkney Islands, north of Pentland Firth. It was deemed that the latter strait, on account of its strong currents and rough seas, would not constitute a serious leak in the barrier. The western passage of 10 miles was to be patrolled by surface vessels. The leak at the eastern terminus afforded by the territorial waters of Norway in the neighborhood of Utsire was closed by a mine field laid by the Norwegian Government in order that her neutrality could be maintained.

LAI, ROW UPON ROW, TO DEPTH OF 240 FEET.

In depth the mines were laid, row upon row, down to 240 feet: below this point no submarine will venture with a reasonable hope of

escaping crushing by the tremendous hydrostatic pressure. The entire project called for about 60,000 American mines and 13,600 British mines.

AMERICANS LAID 56,611 MINES; BRITISH 13,652.

The mine layers arrived in Scotland at the end of May and laying was begun June 8 and continued to October 26, when negotiations tending to end hostilities were entered upon. We actually laid 56,611 mines and our British partners in this scheme laid 13,652 when the work was ended.

The laying of this barrage, in the peril of cold and stress of storm and imminent danger from the high explosives, demanded the highest skill and stoutest hearts, as well as disregard of discomfort and danger. No similar task of this magnitude had ever been attempted. Not a few men of affairs and experience with the sea believed it an impossible undertaking. The authorities at Washington fully appreciated the difficulties and dangers, and realized that no barrage could be depended upon absolutely to prevent all submarines from getting out of the hornets' nest, but as every other offensive had proved only partially effective, it was decided to venture many millions and ask brave and resolute sailors to undertake the biggest and final effort to defeat the U-boats. From first to last, naval statesmen and experts realized that no single operation and no one patented scheme could accomplish the desired result. There is no story of like undertaking comparable to that of the laying of the barrage except that of the sweeping of the mine field. It involved dangers and hardships little realized except by those engaged in the task. The men who laid and swept the mines were the heroes of a sea armada where death lurked every moment.

SWEEPING UP MINES DIFFICULT AND DANGEROUS.

By agreement, the American mines were to be swept by the American mine forces. Even if these mines had been laid at ordinary depths, the number alone would have made this mine sweeping an unprecedented operation; but because of the special purpose of the barrage to prevent the passage of submarines, the lower mines were laid at great depths so that a submarine could not dive under them, and sweeping at depths of 200 to 300 feet was a problem which had never in the history of mine sweeping been encountered. New gear and new methods had to be developed before this new and difficult task could be undertaken.

NEW METHODS TESTED BY EXPERIMENT.

Preliminary experiments were conducted in December, 1918, on the mine field itself, but the task of actual removal was not begun

until later, the weather in the North Sea making it impossible profitably to do the work in the winter months.

The first mine-sweeping operation, which was purely experimental and on a small scale, took place on April 30, 1919, but the mine-sweeping detachment had not been idle during the period since the armistice. On the contrary it had been busily engaged in improvising methods which would be suitable for the work of sweeping up mines, in accumulating stores of mine-sweeping material which would be necessary during the operation, in obtaining additional ships to carry on this great amount of work, and in fitting the vessels suitably for their employment.

A principal base was established in Kirkwall, in the Orkney Islands, contiguous to one end of the great mine field. A notable feature to be recorded is the fact that the *Black Hawk* kept the fleet repaired, despite the extraordinary casualties to machinery that occurred as an unavoidable consequence of the nature of the work upon which the sweepers and submarine chasers were engaged.

82 VESSELS EMPLOYED IN SWEEPING OPERATIONS.

The force actually employed in sweeping operations consisted of 82 ships, divided as follows: 36 sweeping vessels, 20 trawlers, 24 submarine chasers, 1 salvage vessel, and 2 repair ships. The personnel of these vessels was entirely American, and a large proportion of the 4,000 officers and men manning them were of the reserve force. The war was over, yet this force of officers and men working under difficult and hazardous conditions, kept at work with surprising persistence, maintained a high morale, were cheerful and loyal, and the excellence of the personnel contributed greatly to the success of the whole operation.

GREAT CREDIT DUE ADMIRAL STRAUSS AND HIS FORCE.

That the maintenance of such a wonderful spirit in a force is largely due to the personality and ability of the officer in immediate command cannot be gainsaid. Great credit is due and must be given to Admiral Strauss for the high character of the leadership which he displayed, his persistence in carrying on the work against all obstacles, and for the excellent results which have been obtained by the force under his command.

ONE SWEEPER LOST—MANY DAMAGED BY EXPLOSIONS.

There were, in all, eight mine-sweeping operations, and in nearly every one mine sweepers were badly damaged by explosions near them. The trawler *Richard Buckley* was sunk by a mine explosion

on July 12, with the loss of her commanding officer, Commander F. R. King, and the following members of the crew :

Floyd Harman, of Roann, Ind.; engineman, first class.

John Vincent Mallon, of Brooklyn, N. Y.; seaman.

Homer Perdue, of Washington Court House, Ohio; seaman, second class.

Antino Perfidio, of Brooklyn, N. Y.; ship's cook, first class.

George Paul Rezab, of Warman, Minn.; fireman, second class.

George M. Sowers, of Knob Lick, Ky.; fireman, first class.

Lieut. Frederick G. Keyes and Lieut. (j. g.) Walter E. Sharon were injured by the explosion but were saved.

COMMANDER WENT DOWN WITH HIS SHIP.

The *Buckley* was heaving in her kite, when it fouled a mine which exploded near the stern, the vessel sinking in six or seven minutes. Commander King made every exertion to save his crew and remained until the last, going down with his ship.

On the 9th of July no less than six mines countermined under and near the *Pelican* and so damaged the vessel that it was only by the skill and plucky seamanship of the late Capt. R. C. Bulmer that the vessel was brought into port.

On May 14 Lieut. Frank Bruce, commanding the *Bobolink*, was killed by the explosion of a mine which he was attempting to clear, after ordering his crew forward to get them clear of the explosion which he expected to take place. On July 28 Robert I. Simpson, seaman, was washed overboard from the *Curlow* as a result of a mine explosion.

TWO OFFICERS AND NINE MEN KILLED—23 SHIPS DAMAGED.

Altogether 2 officers and 9 men were killed during these hazardous operations and 23 ships were damaged. Regrettable as was this loss of life, it was small in comparison with the number lost in the British mine-sweeping service. Mine sweeping is recognized as the most dangerous work afloat, and our small loss in the great task in the North Sea is an evidence of the care with which the undertaking was organized and conducted.

ALL MINES CLEARED AWAY BY SEPTEMBER 30.

The active systematic work of removal began May 8, and was carried on with the utmost energy. Intervals of only five or six days to effect repairs, refuel, and renew gear elapsed between the different operations. Although working steadily in this way it did not seem possible that the whole barrage could be swept before the winter gales would stop operations for the year; yet the work was so persistently and intelligently carried on that the entire barrage was swept by September 30. On that day all hazard to shipping, caused

by our great enterprise in the North Sea, was removed. A total of 20,711 mines were actually destroyed. The remainder had not survived the severe storms, had exploded on laying, or countermined during mine sweeping.

CHEERFULLY FACED HARDSHIPS AND DANGER.

Too much can not be said in praise of the officers and men who accomplished this task. Working without the incentive of the extra pay allowed by our allies for similar work, they remained at sea three to four weeks at a time, lying hove-to in storms, waiting on the ground for an opportunity to again attack, as soon as the weather would permit; averaging 14 hours of sweeping a day for the entire time; foregoing holidays and shore leave, taking advantage of every bit of daylight, disregarding danger, in order that the sea should again be made safe for peaceful commerce.

REVIEWED ON RETURN TO AMERICA.

Upon their return to the United States in November they were given a welcome as genuine as when our dreadnaughts returned from service abroad. The mine force was reviewed Monday morning, November 24, as it steamed up North River, by the Secretary of the Navy and distinguished officers and citizens on Admiral Strauss's flagship, the *Black Hawk*. At a luncheon given in New York to the officers and men the Secretary voiced the country's appreciation of the magnificent and successful completion of that most hazardous and strenuous operation.

THE NAVY'S WORK ABROAD SINCE THE ARMISTICE.

When the armistice was signed, the work of the Navy abroad changed. From intense activity in which an ever-increasing number of destroyers, in cooperation with allied craft, reinforced and aided more than has been appreciated by the mine barrage across the North Sea, had definitely won the victory over the U-boats, it was to carry on less strenuous but almost as important and more delicate diplomatic and demobilization tasks.

ADMIRAL BENSON NAVAL ADVISOR OF PEACE MISSION.

Admiral William S. Benson, Chief of Naval Operations, was the representative of our Navy in arranging the naval terms of the armistice, was the naval adviser of the peace mission and directed the many varied duties undertaken by the Navy during the important days from the surrender of the German fleet to the sinking in Scapa Flow. His judgment was relied upon by members of the Allied Naval Council, the American Peace Commission, and the Food Administration and

other agencies of relief which required naval assistance. With an able staff, Admiral Benson rendered service of the highest importance, winning rank as one of the world's ablest naval statesmen. He has been decorated not only by his own country, but by France and Great Britain, and is worthy of the high distinction of admiral for life which the House of Representatives voted should be conferred upon him.

ADMIRAL SIMS'S DISTINGUISHED SERVICE.

In the Allied Naval Council, Admiral William S. Sims, who had been the able representative of the Navy in Europe during the entire war, displayed ability of the highest order. His brilliant services abroad won world-wide admiration and he demonstrated that he is worthy of the highest honors Congress can confer upon him. Admiral Hugh Rodman, who had commanded the dreadnaughts in the North Sea, represented our country in receiving the surrender of the German Fleet and was justly honored and decorated by allied nations. In March, 1919, after receiving deserved and distinguished honors and many expressions of the esteem in which he is held, Admiral Sims set sail for home, to become the president of the Naval War College, where he has already set a new and higher standard which will insure an enthusiasm and zeal and knowledge on the part of the naval officers privileged to attend the War College which will be reflected in a more efficient Navy of the future. He was succeeded in command of the United States naval forces in European waters by Rear Admiral Harry S. Knapp, one of the ablest and wisest of naval officers, who also, upon the return of Admiral Benson to this country, became our naval adviser to the Peace Conference at Paris.

ADMIRAL KNAPP A WORTHY SUCCESSOR.

Though the stress of war called for resource and initiative, the days of reconstruction, demobilization and helpfulness of all American activities made demand for no less ability in the head of the naval leader abroad. The duties committed to Admiral Knapp called for knowledge of international law, sound judgment and wisdom as well as proven capacity as a naval officer. In all the difficult, delicate, and important duties intrusted to him during the months of readjustment, Admiral Knapp has given full proof that his countrymen could safely rely upon him in counsel and in action. He has been a worthy successor of Admiral Sims.

MR. ROOSEVELT'S MISSION IN EUROPE.

Upon the signing of the armistice and the closing of naval shore activities abroad, the Navy had a number of stations in Europe, and

valuable material and equipment. In order that it might be sold, salvaged, or brought to America, as in each case was most desirable, Assistant Secretary Roosevelt, accompanied by Commander John M. Hancock, who had shown high ability in the business side of the Navy in cooperation with the War Industries Board, and Mr. Thomas J. Spellacy, an able lawyer, as legal adviser, went to Europe in January and made arrangements by which the Navy's demobilization could be expedited and its property disposed of to the best advantage.

The plans perfected and the negotiations completed have resulted in the disposition of naval property in a way that has been wise and beneficial. The great high-power radio station in France was, through negotiations with the French Government, completed by our Navy, with the agreement that it be purchased by the French Government. Equipment and material that will be needed at home has been brought back, and such as was not practicable or profitable to transport has been sold abroad.

ARMISTICE IMPOSED NEW DUTIES.

With the acceptance by Germany of the armistice terms, the surrender of the major portion of the German submarines and the internment of the greater portion of the main German fleet, the necessity for maintaining a large naval force in Europe on a war footing disappeared. It was immediately apparent that the bulk of our naval forces could be returned to the United States and that the various shore establishments, necessary to the life of the Navy in Europe, could be demobilized. At the same time, it was realized that much would remain to be accomplished by the Navy in European waters in connection with carrying out various provisions of the armistice terms; in assisting in the return of American troops to their home country; in the incidental work of maintenance of such naval units as were retained on this side of the Atlantic; in mine sweeping, and in disposing of the vast stores of material collected in Europe for the prosecution of the war. What new activities would have to be created and to what extent the Navy would be employed in Europe during the year following the armistice, could not be foreseen; in this respect it was necessary to await developments.

DEMOBILIZATION OF EUROPEAN FORCES.

On November 11, 1918, there were 5,352 officers and 75,213 enlisted men on duty in European waters, a force considerably larger than the whole personnel in the Navy prior to the war. This personnel was distributed in upwards of 400 vessels; in battleships with the

Grand Fleet in the North Sea; in mine layers that had just completed laying the largest single mine field—between the Orkneys and Norway—that had ever been attempted; in across-channel service between Southampton and Cherbourg; in destroyers, operating on the southern coasts of England and Ireland, on the west coast of France, from the Azores, Gibraltar and Corfu; in a cruiser in northern Russia, in colliers, tugs, repair ships, the necessary adjuncts of a fleet in being; and on shore in the great 14-inch railway batteries; at air stations in Ireland, England, France, and Italy; in communication services in many places; and at bases on shore wherever the service of the fleet made repair and administration facilities necessary.

Since the armistice 80 vessels, principally destroyers and mine sweepers, have been sent to Europe from the United States, 20 trawlers were chartered in the United Kingdom for service with the mine-sweeping detachment, and 11 ex-German vessels have been commissioned, but of the grand total of some 500 vessels that have served in foreign waters, only 108 remained on October 1, and of these, 68 were returning or under orders to proceed home, 7 are to be sold in Europe, 2 are to be returned to their British owners, and 2 badly damaged mine sweepers are being extensively repaired.

Of the vessels that remain, only five were on the European station on November 11, 1918. Of the great shore establishments which had been built up during the war, but a remnant remains—staff offices in London and Paris, and port offices in Brest and Gibraltar—all the air stations, repair plants, the bases and other port offices have been demobilized. A total of 1,014 officers and 12,701 enlisted men were still on the European station October 1, 6,112 officers and 73,714 enlisted men having previously been returned to the United States, and many more returning recently on the mine-sweeping fleet, which arrived in November. In comparing these figures with those of the figures of personnel in Europe at the time of the armistice, it must be remembered that there has until recently been a steady flow of personnel to Europe—to man vessels commissioned overseas, to provide for reliefs for reserves, duration of war men, and others, and in the crews of vessels sent out since that date. Taking it altogether, it may be safely reported that the force as it existed at the date of the armistice has, to all intents and purposes, been demobilized.

OPERATIONS OF NAVAL FORCES IN EUROPE.

The operations of the naval forces in Europe during the past year have been of the most varied nature—guarding American interests in disturbed countries in Europe; carrying commissions of inspection and inquiry and insuring communications where land transportation

was not available; assisting in the repatriation of American troops; sweeping the North Sea barrage; the establishment of port offices to further relief work; supervising enforcement of the terms of the armistice—such were some of the miscellaneous duties performed.

ACTIVITIES THAT HAVE BEEN COMPLETED.

Some of these various duties may be considered as completed; such are:

IN NORTHERN RUSSIA.

Vessels have been in northern Russian waters during the last year and were not entirely withdrawn until autumn. The purpose of this force was to guard American interests and to assist in the evacuation of American troops which were forming part of the allied forces operating in this area. The presence of the force served a useful purpose in stimulating the morale and assisting in the evacuation of Americans.

IN THE BALTIC AND NORTH SEA.

Early in January, 1919, American men-of-war visited German Baltic ports to assist in the repatriation of Allied prisoners of war. Since that date our vessels have frequently visited German ports in connection with the inspection of ports and vessels, and in furthering the work of the Shipping Board and American food relief administration. In addition, port offices were established in Antwerp, Rotterdam, Hamburg, and Danzig, and the officers connected with these offices have rendered valuable service in stabilizing conditions, in assisting in the routing and management of American vessels and in the distribution of food. The work of Capt. J. K. Robinson, Capt. D. C. Hanrahan, Commander C. A. Abele, and Commander L. R. Leahy deserves special commendation. Numerous expressions have been received from civil officials of the American Government, on duty in Europe, testifying to the high character, ability, initiative, and resource of these officers under trying conditions. It is hardly too much to say that the work of the Food Administration was in the early stages largely dependent on naval cooperation, and Hon. Herbert Hoover has been warm in commendation of the efficiency of the Navy personnel engaged in this humanitarian work.

In the latter part of May, 1919, a mission, of which Capt. W. C. Cole, United States Navy, was senior member, was sent to Holland to collaborate with a commissioner representative of the United States Shipping Board in the work of the return to their owners of Dutch ships requisitioned by the United States in March, 1918. This work was completed in a manner worthy of the best naval traditions, on October 1, 1919, 54 ships having been delivered of a total tonnage of 369,557 deadweight tons.

FORCES IN FRANCE.

Although the forces in France are not entirely demobilized, yet the end is in sight and the remaining work will apparently follow the course of previous operations. The work of this force has been principally in cooperating with the Army in the return of troops to the United States; and the facilities established by the Navy at Brest, in particular, have been of paramount importance in the speedy accomplishment of this task. It should be realized, however, that immediately after the armistice, the number of vessels operating in Europe under the direction of the Shipping Board largely increased and many vessels, besides transports, called at French ports where United States naval facilities were at their disposal. These facilities included routing of vessels while mine fields along the coast were still in existence, in giving them fuel and repairs and insuring rapid discharge or loading, as the case might be, of the vessels concerned, and generally in expediting turn-around.

Special mention should be made of the salvage facilities which have been established on the French coast, the full report of which shows important naval tasks well performed. A naval unit, having its headquarters at Lille, rendered valuable relief assistance in the housing of refugees returning to devastated areas of France and Belgium.

The forces in France were directed by Admiral Henry B. Wilson with the highest efficiency until his return to America early in the present year. Upon his detachment to become commander in chief of the Atlantic Fleet, the naval activities have been under the immediate command of Rear Admiral A. S. Halstead, and it is largely due to the untiring efforts of this officer that the arrangements for embarkation and repatriation of American troops, so far as the Navy was concerned, were so well handled. Great credit is also due to him for the expeditious and very satisfactory demobilization of our own naval facilities and forces in France.

IN THE AZORES.

It has been necessary to maintain certain facilities in the Azores until very recently. The vessels of this station frequently assisted towing disabled vessels to port and in giving them repairs sufficient to enable them to proceed on their voyages. A battery of 7-inch guns established at Ponta Delgada during the war remains at that place in charge of a small detachment and will probably be presented to the Portuguese Government. The station at Ponta Delgada has been of great importance to the Navy in the demobilization of the smaller craft from this station.

IN GIBRALTAR.

A port office has been retained at Gibraltar and, in close cooperation with the British authorities at that place, has served to expedite vessels of the Navy, Shipping Board and Army transports which have called there for routing instructions, repairs, and fuel. The steamship *Ophir* has been in charge of the port officer ever since that vessel has been salvaged, and is now being repaired sufficiently to enable it to proceed to the United States under its own power with the entire personnel of the port office.

COMMISSIONING EX-GERMAN VESSELS.

Ten ex-German passenger vessels and one cable ship were commissioned in Europe, using principally personnel which were being demobilized from forces in Europe. In addition, six surrendered German submarines turned over to the United States were manned in Europe and sent across the Atlantic, five of them under their own power.

ACTIVITIES STILL REMAINING IN EFFECT.

FORCES IN ADRIATIC.

A force has been maintained in the Adriatic to assist in the execution of the terms of the Austrian armistice, at first under Rear Admiral W. H. G. Bullard, then under Rear Admiral A. P. Niblack, and later under Rear Admiral Philip Andrews. In addition to inspection of Austrian ports and the taking over of certain Austrian vessels, the force has been variously engaged in relief work in conjunction with officials of the Food Administration. The outstanding personalities of the different American admirals who have commanded this force, their tact and ability, have contributed largely toward preventing friction and even collisions in the zone of their special operations where various acute problems have arisen due to the conflicting aspirations of the different nationalities along the Adriatic littoral.

UNITED STATES SAILORS PREVENTED CLASH AT TRAU.

In September a small guard of American sailors were landed at Trau, at the request of Italian authorities. The following dispatch from Admiral Knapp, sent from United States naval headquarters, London, September 30, gives the facts with reference to the landing, and is a concrete example of the wisdom and sound judgment displayed by our naval officers abroad:

The armistice line extends from Cape Planka inland. North and west of this line Italian troops in occupation, south and east of the line garrisoned by Serbian troops. This latter section, Dalmatian coast, headquarters American

naval forces, in which by agreement after armistice American naval forces took charge of all one-time Austrian-Hungarian vessels found there, and which has since been generally called American zone. Americans have no troops on shore, but have extended a strong moral influence for the preservation of order and avoidance of clash between Italians and Jugo-Slavs. There has been considerable friction along armistice line between Serbians and Italians, but by the tactful firmness of American admiral there, it has been kept from causing serious results.

On September 23 three truck loads of Italian soldiers, in command of an Italian army captain, crossed armistice line from Italian zone and surprised and captured the small Serbian garrison at Trau. The Italian authorities informed the senior American officer present, Capt. Boyd, that the move was unwarranted, and asked that the raiders be turned back. Boyd sent a destroyer and two chasers to Trau at once, then saw the Serbian commander and got him to agree not to order an advance until he had an opportunity to get Italians to withdraw. He sent Lieut. Commander R. S. Field and Commander Maroni, of the Italian ship *Puglia*, by automobile to Trau, and himself went in the U. S. S. *Olympia* to Trau. On arrival he found that Italians had been induced to return, leaving, however, Italian army captain and three soldiers, owing to breakdown of truck. He landed a small guard from the U. S. S. *Cowell* and U. S. S. *Olympia* to see no harm was done by Italians and preserve order pending arrival of Serbian troops. He put the Italian army captain and three soldiers on an Italian motor boat and turned them over in charge of an Italian naval officer. Upon arrival of the Serbian troops he withdrew bluejackets, after first receiving assurance that no violence would be offered to civilians.

Italian Admiral Millo, in command of ships and troops in Italian zone of occupation, sent senior Italian officer present at Spalato to U. S. S. *Olympia* with thanks for sending Trau raiders back. He has brought the officer commander of the raiding force to trial by court-martial. The whole affair was most creditably handled and the prompt action of Capt. Boyd, in my opinion, undoubtedly prevented a very serious incident which might have resulted in open warfare between Italians and Serbians. The landing was for the protection of the offending Italians left in Trau until adequate Serbian forces could arrive to preserve order.

The fact that Italian authority requested action of Capt. Boyd, and that he was thanked by Admiral Millo for his action, and that Admiral Millo brought offending officer to trial by court-martial, all go to show that the raid was an isolated act of hot-heads, done in defiance of Italian authority, and that America acted in cooperation with Italians to restore the situation. That no serious result happened is due to the prompt and efficient action of American forces. Had they not so acted, there would almost inevitably have been bloodshed, which would perhaps have resulted in a state of actual war between Italy and Jugo-Slavia, owing to the intensity of feeling existing over the Dalmatian question.

IN TURKISH WATERS.

The force in Turkish waters has rendered valuable service in carrying missions to different ports in Armenia, Turkey, and in advising as to conditions in this demoralized portion of the world. The high purpose and integrity of Rear Admiral Mark Bristol, United States Navy, and his resolute bearing have made of him an outstanding figure in recent Turkish affairs; and the President of the United States has recognized the excellent services which Admiral Bristol

has performed by appointing him United States High Commissioner in Turkey.

Of the flag officers just mentioned, Admirals Andrews and Bristol have been closely associated for such a long period with the affairs in the areas where they commanded United States naval forces, and have maintained such close personal touch with local conditions that the information and advice which they forwarded to the American peace mission is probably of more value than information received from any other source.

COMMUNICATIONS.

Communications in Europe, particularly through disturbed regions, have been greatly assisted and facilitated by the officers and men of the American Navy. The American Navy furnished the working force for the communication offices established for the use of the Peace Commission in Paris. Communication parties have been sent to various points in Europe, and Navy personnel has manned and is manning to-day special lines connecting Paris and Vienna, Warsaw, and Bucharest, and other points in what was previously enemy territory. Regular telegraphic communication is not yet reliable and these special private American lines have been of a value difficult to estimate. By means of a high-power radio set in the United States, it is possible to receive communications in the Force Commander's office in London, on board the *Olympia* in the Adriatic, and at Admiral Bristol's headquarters in Constantinople.

MAINTENANCE AND REPAIRS.

On November 11, 1918, there were naval repair facilities of considerable extent, either afloat or ashore, in the United Kingdom, France, Gibraltar, in the Mediterranean, and at the Azores. Although nearly all vessels of war in Europe were sent home within a short time after the armistice was signed, yet the number of vessels of merchant type operated under naval control by the United States Shipping Board rapidly increased. In addition to a constantly large volume of minor repairs to these vessels, there were numerous cases of major casualty damage which were efficiently and properly handled by our repair organization. Special mention should be made of the work performed by the *Bridgeport* and the repair organization at Brest, which completed some 12,000 items of repairs to men-of-war and vessels of the transport force, and has been of invaluable assistance in the return of the American Expeditionary Force. Of work purely naval in character, special mention must be made of the work performed by the *Black Hawk* and *Panther* in maintaining a large number of mine sweepers, trawlers,

and submarine chasers which were engaged in the hazardous and difficult duties of the Northern Barrage.

FOREIGN COOPERATION.

Allied officials, from the arrival of the first division of destroyers, have uniformly given to the American naval forces in Europe every facility in their power and have rendered invaluable assistance to our Navy in the furtherance of its own particular activities. The British Admiralty, with which our cooperation in the North Sea in operations against the submarines and in other ways was on a larger scale than with the other allied navies with which we were associated, rendered our officers every facility. Our operations with the French and Italians, while not upon such large proportions, were equally agreeable, and every help was rendered and every courtesy shown. Indeed all these nations often gave priority for repairs to American ships. The ties between the navies of these nations were strengthened and cemented by this intimate and delightful service together.

EIGHTEEN GREAT CAPITAL SHIPS UNDER CONSTRUCTION.

During the last year of the war all the energies of the department in the construction line were concentrated on vessels to cope with the submarine menace. As late as October, 1918, we received insistent and urgent recommendations from the representatives of the Allies that the antisubmarine program be accelerated to the limit in view of existing and anticipated conditions. From our entry into the war work upon the later large vessels of the three-year program had been suspended.

With the armistice an accomplished fact, the question soon arose whether these vessels should be pressed to completion on the prewar plans or materially modified as a result of war experience. The principal and indeed the only important question was as regards the battleships and battle cruisers. Should we proceed with the two distinct types on the prewar plans, modify the plans but still build two distinct types, or abandon the plans altogether and build a single type to do the work of both the battleship and battle cruiser? There was being constructed then in England the *Hood*, a vessel with the speed of earlier battle cruisers (though less than that of our design) a heavier battery than that of previous battle cruisers abroad (though still of only about half the power of our latest battleship designs), and protection much greater than that of earlier battle cruisers.

STUDIED LATEST DEVELOPMENTS IN OTHER NAVIES.

The question at issue, involving as it did 12 capital ships which would upon completion be the backbone of the United States Navy for a number of years, was a most momentous one; and it was felt that nothing should be left undone to solve the problem rightly, taking into account the views not only of our service but, so far as available, of all the services which had been involved in the war. For the purpose of consultation with foreign admiralities and officers, in the spring of 1919—accompanied by the chiefs of the three technical bureaus of the Navy Department having to do with the construction of ships, namely, Rear Admiral Griffin, of Steam Engineering; Rear Admiral Taylor, of Construction and Repair; and Rear Admiral Earle, of Ordnance; with Commander Foote, as aid—I took passage for France. The party returned on May 17 after having visited and consulted with the admiralities and distinguished officers of France, Italy, and Great Britain, and after the technical officers who accompanied me had been given ample opportunity to examine the *Hood*, then launched but not completed. The admiralities and officials of each country visited showed the greatest willingness to furnish information and advice, and consulted fully and freely with us as to the questions at issue and other questions of naval experience, naval policy, and naval development.

CONSIDERED BY GENERAL BOARD AND ADMIRALS OF THE FLEET.

Upon my return the matter was taken up by the General Board, composed of Admirals Badger, Fletcher, Winterhalter, Sims, and Niblack, Gen. Barnett, and Capt. Cotten. Although Admiral Sims and Admiral Niblack, of the General Board, were fresh from service abroad during the war and exceptionally well informed as to war experiences, it was felt that in a matter of such importance it would be well to supplement the General Board by the commander in chief of the United States Fleet, Admiral Mayo, and Admiral Rodman, who had commanded the division of the United States Battle Fleet which cooperated with the British Grand Fleet for many months during the war. These were accordingly added as temporary members. At sessions of the enlarged board considering the questions at issue, the three chiefs of technical bureaus who had accompanied me abroad were present, so that the General Board might have the advantage of the large amount of information which they had obtained.

GREATER PROTECTION FOR BATTLE CRUISERS.

After consideration of the matter, the unanimous recommendation of the General Board as temporarily enlarged was that the battle-

ships should be "completed as expeditiously as possible on present lines of development and that future designs of battleships should depend upon further development in battleship construction." As regards the battle cruisers, in view of the importance of protection as indicated by war experience, it was recommended that "the six battle cruisers now authorized be completed as expeditiously as possible, but with additional protection, particularly to turrets, conning towers, magazines and communications, at the expense of a small reduction in speed."

The recommendations of the General Board were at once approved, and I gave instructions to proceed with the work accordingly. There was necessarily some delay involved by reason of the necessity of changing the plans of the battle cruisers, increasing the displacement and the protection and slightly reducing the speed. Revised general plans were placed in the hands of the builders on September 1, and the preparation of working plans and actual construction will go on as rapidly as practicable in view of the large size and immense power of these vessels.

259 VESSELS COMPLETED IN A YEAR.

During the 12 months ending October 1, there have been completed 1 battleship, 103 destroyers, 32 submarines, 52 Eagle boats, 36 submarine chasers, 1 fuel ship, 31 mine sweepers, and 3 seagoing tugs. This leaves under construction at the present time 12 battleships, 6 battle cruisers, 10 scout cruisers, 2 gunboats, 8 auxiliary vessels, 136 destroyers, 58 submarines, 8 Eagle class patrol vessels, 6 mine sweepers, and 14 seagoing tugs.

103 DESTROYERS DELIVERED IN 12 MONTHS.

While the special instructions relative to expediting work on destroyers were canceled after the armistice, work on the war program had by that time been thoroughly organized and deliveries have proceeded rapidly since that date. During the 12 months ending October 1, 1919, 103 had been delivered. Deliveries are now averaging about 10 per month, and it is expected that those remaining, 136 in all, will be completed within the coming year.

These new destroyers are all oil burners, standard type, 315 feet long; beam, 31 feet; mean draft, 9 feet 4 inches, and, equipped with motive machinery of 28,000 horsepower, make 35 knots an hour. They demonstrated their worth in war and in peace, and in themselves constitute a fleet of swiftness and power in which the Republic can safely trust. The story of their successful war against submarines and their successful sinking of those assassins was recorded in last year's report.

NEW RECORDS IN CONSTRUCTION.

Some new records were made not only in speed and achievement by these "gray wolves of the sea," but world records were broken in the short time in which they were constructed. The *Ward*, built at the Mare Island Navy Yard in 1918, was launched $17\frac{1}{2}$ days after her keel was laid, and put into commission in 70 days. On November 6 of this year the *Reid*, built at Squantum, Mass., by the Bethlehem Shipbuilding Co., was delivered to the Navy at Boston. It was constructed in $45\frac{1}{2}$ working days, the shortest time in which a destroyer has ever been completed from the laying of the keel.

52 EAGLE BOATS COMPLETED.

The original program of Eagle class patrol vessels, built at Detroit, included 112 vessels, 12 having been ordered for the Italian Government. These vessels were designed primarily for antisubmarine work but are suitable for general patrol duty such as is assigned to gunboats and small cruisers. Arrangements, when the armistice was declared, were made for the cancellation of the contracts for 52 of these vessels, including those intended for the Italian Government, leaving 60 to be completed. The first three Eagle boats were brought out from the Lakes prior to the close of navigation in the fall of 1918, and have since been in successful service in European waters. By October 1 last a total of 52 had been completed, and it is expected that all 60 will be ready in time to be brought out before the close of navigation this year.

EXCELLENT ANTISUBMARINE CRAFT.

The Eagle boats, built by the Ford Motor Co., were a war product, planned, designed, and built after the United States had entered the war and were primarily intended to operate against submarines. Had the war continued into 1919 and 1920, hundreds more would have been turned out. They are standardized, being fabricated boats, and although not so large nor so fast as the modern destroyers, are far superior to the submarine chasers. They are 550-ton boats, single screw, geared turbine engines, oil burning, and well equipped to fight submarines, being fitted with 4-inch guns and designed to carry depth charge projectors and submarine listening devices. They have a speed of 18 knots and a cruising radius of about 3,000 miles.

THREE MADE 6,000-MILE VOYAGE TO RUSSIA.

The first three of these boats built were sent overseas in the spring of 1919 for duty in northern Russia. They left New York in company on April 11, arrived at the Azores April 24, and left there April 27,

arriving at Plymouth, England, May 2, where they completed fitting out for their duty in Arctic waters. Leaving Plymouth May 9, they arrived at Inverness, Scotland, May 12, and departed on May 15 for Murmansk, Russia, where they arrived May 21. This was a cruise of about 6,000 miles made in a total time of 40 days with only 27 days actual steaming. While no heavy sea was encountered, their behavior on this trip was excellent, the engines and other equipment giving satisfactory results and being as comfortable at sea for the personnel as any ship of the same type and tonnage.

SEVERE TEST PROVED THEIR VALUE.

This trip was made under the most adverse conditions, the officers and crew being comparatively green, having had, of course, no previous experience with boats of this type, and the boats had never been subjected to the test of a long ocean cruise. The ability and success of these Eagle boats was thus proved in an exceedingly practical way, and had the war continued their effectiveness against the submarine would have fully demonstrated the wisdom of their construction.

10,520,000 HORSEPOWER IN ENGINES OF NEW VESSELS.

When the vessels now building or under contract are completed, the propelling power of our ships will be five times as great as it was prior to the war. The addition represented by the destroyers alone will reach 8,000,000 horsepower. To drive these destroyers at the high speed of 35 knots, 40 miles an hour, requires engines of 27,000 to 28,000 horsepower, as much as is required to propel a dreadnaught like the *Utah*, and nearly two and a half times as much as the power in the *Oregon*, the largest type of battleship employed in the war with Spain. To drive the huge new 43,500-ton battle cruisers through the water at 33 knots will require the largest propelling force ever placed in any vessel, engines developing 180,000 horsepower, a total of 1,080,000 horsepower for the six to be built. For the six new 43,200-ton superdreadnaughts, 11,800 tons larger than the *Pennsylvania*, engines of 60,000 horsepower will be required—a total of 540,000 horsepower. The ten scouts will have an aggregate of 900,000 horsepower. With these additions the machinery of the fleet will have a total propelling force of 13,000,000 horsepower—eight times as great as that of all the passenger-carrying ships that ply the Atlantic, including the big former German liners.

BATTLESHIPS STEAMED 1,424,321 MILES IN A YEAR.

During the last fiscal year our battleships alone steamed 1,424,321 miles; our destroyers in European service, during the war period, made as high as half a million miles a month; the transports operated

by the Navy, plying constantly between America and Europe, steamed millions of miles, and in addition there were hundreds of submarine chasers, armed yachts, auxiliaries, tugs, and other craft in operation.

NEARLY 2,500 VESSELS IN OPERATION OR BUILDING LAST YEAR.

On July 1, 1918, the Navy was operating or building 2,275 vessels, including 570 regular naval vessels, 93 drawn from the Coast Guard and Government departments; 937 converted merchant vessels, comprising all types from troop transports to craft of the mosquito fleet; 247 vessels of the Naval Overseas Transportation Service; and 428 combatant and auxiliary vessels in service. Before hostilities ended this number was further increased by some 125 ships added to the Overseas Transportation Service, and additions of destroyers and other vessels completed for the Navy.

This will give some idea of the immense volume of work of the Bureau of Steam Engineering in maintaining propelling and auxiliary machinery. In addition it supervises the designing and building of our engines and machinery, and one of the most difficult construction problems of the war was the securing of the large numbers of engines required for destroyers, submarine chasers, Eagle boats and other vessels building for the Navy.

THOUSANDS OF AEROPLANE ENGINES BUILT.

In addition to the hundreds of engines for vessels, 2,655 aviation engines for naval aircraft were delivered, and 3,989 were under construction when the armistice called a halt in production. Radio installations on ships built or contracted for numbered about 4,000, and equipment was furnished for 210 independent shore stations. The high-power radio stations erected during the war were designed and constructed under the supervision of this bureau.

BUILDING ELECTRIC MACHINERY IN NAVY YARD.

Its success being thoroughly demonstrated in the *New Mexico* all our new battleships and battle cruisers are to be equipped with the electric drive. This has made it necessary that at least one of our navy yards be equipped to handle any work that may develop in connection with this new installation. Accordingly, it has been decided to construct at the New York Navy Yard the machinery for one of the four latest battleships, two of which will be built there. The machinery for the others will be procured by contract, but that to be built at New York will be from the same plans, the contractors furnishing complete working drawings and from time to time such technical advice as may be necessary. In this way it is believed that

the navy yard will acquire the experience required to undertake any repairs that may become necessary on vessels equipped with electric machinery.

NAME OF BUREAU SHOULD BE CHANGED.

The official designation of the Bureau of Steam Engineering does not by any means convey an idea of its activities—in fact, it is a misnomer. It was adopted at a time when steam was the only form of mechanical energy in use, and although the major portion of the duties of this bureau are still concerned with steam and its application in mechanical engineering, the adoption of electric drive for capital ships has largely increased its electrical engineering duties, previously concerned with electric lighting and the supply of power for comparatively small electric motor installations. In addition to these, its activities in radio engineering have long been of the first importance, while the advances in submarine construction and in aircraft have greatly increased its duties as regards oil and gas engines.

In view of these varied activities, I suggest that the designation of this bureau be changed to the "Bureau of Engineering," as being more comprehensive and more accurately descriptive of its duties.

LARGEST NAVAL GUNS FOR OUR BATTLESHIPS.

Guns larger than any now in use or being placed afloat by any other navy are being built for our new battleships and battle cruisers. Of 16-inch, 50-caliber, with muzzle energy of 115,000 foot-tons, these are the last word in American naval design. One hundred and ninety of these powerful guns are to be manufactured, and their combined energy will be approximately 21,250,000 pounds. The projectile for these guns weighs 2,100 pounds, and the entire number will be capable of firing nearly 200 tons of projectiles at a time. To produce this result 125,000 pounds of powder would be burned in about one-twentieth of a second. A single discharge of these combined batteries, ordnance officers estimate, would produce energy equal to that required to lift a battleship to the height of the Washington Monument.

DEVELOPMENT OF THE 16-INCH NAVAL GUN.

The question of increased size of naval artillery for capital ships is one which, of course, is subject to continual discussion and development in the Navy. The 14-inch gun having proved a success, plans were initiated to develop a 16-inch gun. These plans were brought to a fruition on September 30, 1914, when the first 16-inch 45-caliber gun was proved. A few minor changes were made in the designs,

and it was re-proved in May, 1916. This gun was so successful that it was decided to install it on battleships 45, 46, 47, and 48.

The 16-inch 45-caliber gun having proven so successful, further plans were made to increase the power of this gun by increasing its length to 50 calibers, and on April 8, 1918, the first 16-inch 50-caliber gun was proved. Again were the designs successful, and it was immediately decided to arm the recently authorized battle cruisers and battleships 49 to 54 with these guns.

GREATER ACCURACY AS WELL AS EFFECT.

It is interesting to note the reasons for an advance in power in naval artillery. As the size and weight of the projectile increases, the more accurate becomes the trajectory, so that with increase in power, greater probability of hitting is secured. It is found also that the smashing effect of a large heavy shell, one that overmatches in caliber the thickness of the armor, has proven to be much greater in service than any calculations by mathematical formulæ indicate.

The increase in size of the gun provides such a large increase in power that some slight decrease in muzzle velocity may be permitted, and the decrease in muzzle velocity materially reduces the destructive effect of erosion. It may be said in general terms, therefore, that the 16-inch 50-caliber gun is not only of greater power than the 14-inch, but probably also possesses a longer life. The muzzle energy of the 16-inch 45-caliber gun is approximately 100,000 foot-tons, which in the 50-caliber is increased to 115,000 foot-tons.

The success in France of the 14-inch naval guns on railway mounts, the equipment of our dreadnaughts with huge guns, manufactured at the Naval Gun Factory and tested on the naval proving grounds, attest the accomplishments of the Navy in the production of guns of the largest caliber and greatest range.

METHODS OF MAKING GUNS IMPROVED.

With the notable development in making guns, there has been a marked improvement in methods. High-power guns had their inception during the Civil War when an American Army officer, Capt. Rodman, produced a cast-iron gun of extraordinary power by cooling the interior of a molten gun, and maintaining this difference in temperature throughout solidification. This was based on the principle of initial compression on the interior portion and initial tension on the exterior portion. The shrinking of a wrought-iron band around the breech was the next step, and this was the real beginning of modern gun construction. With the advance in the art of casting and forging steel came increase in the size of cannon until the modern 16-inch gun, about 70 feet long, represents the highest stage of the art so far realized.

STRENGTH COMBINED WITH LIGHT WEIGHT.

And now we are adopting the principle developed by Rodman to cold metal, substituting for the internal pressures created by the different temperatures of successive increments, an internal hydraulic pressure. This pressure has been run up to about 100,000 pounds to the square inch, and under such a pressure the interior layers or increments of the cold forging are compressed and the exterior increments stretched. With the withdrawal of the pressure the gun is left in the strained condition, when fired the strain of firing is communicated to all layers equally, and enhanced strength results.

This process eliminates an enormous amount of machine work in gun construction, for the gun is made in one piece, and on account of its greater strength makes a lighter gun for the same power. Guns up to 4 or 5 inches have been made by this new process, and these, in spite of their smaller weight and cheaper construction, are as accurate and long-lived as the other type. So far we have not succeeded in applying this method of construction to the larger guns, but this application may be expected as the art develops.

ORDNANCE PRODUCTION—ECONOMY AND PROGRESS.

With the signing of the armistice, when ordnance production was at its height, supplying vast quantities of munitions sufficient to meet present and future demands, came the task of slowing down the war machine. This called for prompt and wise action. The many thousands of mines required for the North Sea barrage had been made and laid, and we were preparing the mines for the barrage in the Adriatic and Ægean seas projected by the Allied Naval Council. We were preparing to furnish 50 more 14-inch railway batteries, the most powerful in existence, for service on the western front, the five already in action having proved the most effective long-range artillery in use by the Allies. These batteries would have been capable of dropping 60 tons—120,000 pounds—of steel projectiles and high explosives on enemy positions in a single minute of firing. Depth-bombs had been increased from the 50-pound charge used early in the war to a standard size carrying 300 pounds of T. N. T., and we were beginning the manufacture, in numbers, of the latest design, a huge bomb containing 600 pounds of explosives. We were producing seven-inch guns on tractor mounts, and twenty of these, for the Marines, were completed and awaiting transportation to France.

Torpedoes in unprecedented numbers and other naval engines of war were being constructed more rapidly than they could be transported, for naval ordnance was being produced for both land and sea warfare.

\$100,000,000 IN CONTRACTS CANCELED IN ONE WEEK.

Steps were taken in November to shut off full steam, contracts were annulled or amortized, and in a short time the wheels moved more slowly. This was not easy, but cooperation of manufacturers made it less difficult, contractors showing a spirit of gratifying reasonableness. Savings of over \$100,000,000 were effected in one week; and \$62,000,000 more in the next month. Salvaging of equipment and supplies in ordnance materials has resulted in large saving to taxpayers, and has been carried out with justice to all.

ARMOR PLANT BEING PUSHED TO COMPLETION.

With the let-up in production of war weapons, our ordnance experts have turned their energies to the completion of the armor-plate plant at Charleston, W. Va., where, before a great while, the Navy can make the armor for its ships and conduct experiments for improvements which were not possible when our sole dependence was upon private makers of armor.

This plant is to be the model steel works of the country and will have an annual capacity of 20,000 tons of armor plate, 10,000 tons of large gun forgings, and 10,000 tons of major-caliber armor-piercing projectiles, with an additional capacity to produce many of the high quality forgings which are required in modern gun construction. Experience in building destroyers during the war demonstrated that probably the most difficult material to secure from private plants was the enormous steel forgings which are the backbone of ship construction, and the Charleston plant will be equipped to produce these, as well as ordnance forgings.

NEW TORPEDO FACTORY—OTHER PLANTS ENLARGED.

In the new torpedo plant at Alexandria, added to the facilities of the torpedo plant at Newport, the Navy can manufacture the bulk of the torpedoes that will be required for its hundreds of destroyers and many submarines. The new proving grounds on the Potomac, the new mine storage depot at Yorktown, the increase in the gun factory at Washington, enlargement of the torpedo factory at Newport and other ordnance extensions will find the Navy well prepared to produce the bulk of its ordnance needs.

NAVY YARDS AND BASES ON THE PACIFIC.

In 1916, with the view to proper naval establishments on the Pacific coast, a commission of able naval officers was appointed under direction of Congress to make a study of the navy yards on the Pacific and to make recommendations for new yards and such enlargements of

the old ones as naval expansion and protection of the Pacific States might require. An exhaustive study of all the bases and harbors of the Pacific was made by a board, known as the Helm Board, and the results and recommendations forwarded to Congress shortly before the United States entered the World War. Action on the report was necessarily postponed until the conclusion of the war. The report is not only an exhaustive study of facilities and opportunities on the entire seacoast, but it contains a mass of information upon the rivers, harbors, and channels. It also points out what should be done in harbor improvements as well as in naval development.

EXPERTS MADE CAREFUL INVESTIGATION.

In view of the organization of a great Pacific Fleet, more than twice as large in tonnage and in every other particular than the fleet which Admiral Evans took around the world in 1907, the importance of deep harbors and large navy yards and naval bases is more realized and emphasized than formerly. In August I joined the new Pacific Fleet at San Diego and, with able naval experts, made a personal visit and study of all the suggested possible sites for naval purposes from the Mexican to the Canadian border and Hawaii. The experts, who accompanied me and made the trip and made careful investigation, were Rear Admiral J. S. McKean, acting chief of Operations; Rear Admiral C. W. Parks, chief of the Bureau of Yards and Docks, and Commander J. C. Hilton, of the Bureau of Supplies and Accounts, an expert in the supply and storage of fuel oil and other naval supplies. Commander P. W. Foote was also a member of the party. The report of these able officers—interesting, instructive, and of most practical value—will repay a careful reading and consideration. It is published as Appendix D in this report.

BEGINNING SHOULD BE MADE NOW.

In the annual estimates submitted to Congress I have followed, in a measure, the recommendations of the Helm Board and the McKean committee asking at this time only for the appropriations needed for the construction and enlargement of naval bases most needed on the Pacific. Generous cities have tendered the gift of valuable sites in some of the places recommended. I can not too strongly urge that Congress at the coming session will make a large beginning in the development of shore bases and navy yards and air stations on the Pacific. Very little money has been spent on that coast and the time has now come when the enlargement of the fleet makes large expansion necessary for its proper care.

NEW DRY DOCKS OPENED.

The enlarged Navy and the greatly increased merchant marine have taught us the vital need of sufficient dry docks to receive the largest dreadnaughts and the biggest ocean liners. The war showed the acuteness of this prime necessity, too long neglected. When the *Vaterland*, renamed the *Leviathan*, was taken over to transport soldiers to France, the country was rather startled to find that there was not a dry dock in the United States large enough for that big liner.

NORFOLK AND BOSTON DOCKS COMPLETED.

It is true the Navy was building one at the Norfolk Navy Yard of sufficient proportions, but it was not ready, though work had begun before the war and it was being rushed to completion. Opened in April, this dock is 1,011 feet long, 144 feet wide at coping, and 40 feet deep. It cost \$4,500,000 and will accommodate any ship that can pass through the Panama Canal. It was true also that the Commonwealth of Massachusetts, with large vision, was completing a dry dock 1,176 feet long and 149 feet wide at coping. But it was far from ready. Later, by authority from Congress, the Navy purchased and completed it, providing accommodation for the largest naval and commercial ships. The largest of all our docks, it is a naval and commercial asset of the first importance. Operated as a part of the Naval Establishment, it will be a blessing not only to Massachusetts but to the whole Navy and particularly to all New England shipping.

AT PHILADELPHIA AND CHARLESTON NAVY YARDS.

A large dock is building at the Philadelphia Navy Yard, a replica of the Norfolk dock, and work will be begun shortly on the dock at the Charleston Navy Yard, on the Atlantic. Before the war, the Navy made possible the construction by a private corporation of a big dock at Hunters Point in San Francisco Harbor, which was of the highest value upon the arrival of the Pacific Fleet in that splendid harbor. It is 1,007 feet long, 153 feet wide at coping, and 37½ feet deep. A great dry dock at Panama had been provided when the canal was dug.

Work will shortly be pushed on the Charleston dock. At present there is no dry dock south of Hatteras—not one between Norfolk and Panama. The need, in this stretch of 1,740 miles, of a dock big enough to take the largest dreadnaughts, has long been felt. We have four great Navy dry docks north of treacherous Hatteras, and not one south of Hatteras. Congress directed the War Department to deepen the channel at the Charleston Harbor and at the same time appropriated \$4,000,000 to construct a big dry dock, practically like the great docks at Boston, Norfolk, and Philadelphia.

TWO DRY DOCKS FOR MERCHANT SHIPPING AT NORFOLK.

The Shipping Board, in order to meet the need of merchant ships, financed the building of two dry docks in the Norfolk Navy Yard, adjacent to the modern machine shops of the Navy. On the 31st of October these docks were opened under the brightest auspices, when the Queen of the Belgians, who, with the King, on that day visited the navy yard, christened these two latest docks. It was an important occasion, and the many thousands of people present cheered when the Queen pressed the button and the docks were flooded.

GREAT PEARL HARBOR DOCK COMPLETED.

Of more than national significance was the completion of the dry dock at Pearl Harbor, in Hawaii, and its flooding on the 21st day of August, in the presence of many thousands of people and a distinguished company. The Spanish-American War taught the needs of a naval base in Hawaii, the crossroads and strategic and commercial center of the Pacific. A small naval station was first built and Congress authorized the construction of a graving dock 589 feet long. Later, as the ships became larger, and the Panama Canal indicated the probable limit of battleship length and width, the dock was increased to 1,002 feet long, 138 feet wide at coping, and $32\frac{1}{2}$ feet in effective depth. Work was begun and progress made in the construction until suddenly, on February 17, 1913, the country was startled to read that by seismic upheaval the Pearl Harbor Dry Dock had collapsed.

NEW PLANS AND METHODS OVERCAME DIFFICULTIES.

Distinguished engineers and geologists were engaged to make a study and report whether it was possible to build a permanent dry dock on that foundation. There was such difference of opinion that it was at one time contemplated to build a floating dock, notwithstanding its unsatisfactoriness and its cost of operation. But finally the joint study of half a dozen civil engineers of the Naval Establishment and civilians, working together, headed by the late Mr. Alfred Noble, devised a plan of construction which they thought would be successful. It was adopted by the department, Congress authorized the increased appropriation, and the contractors went to work to build upon the new plans. Would it succeed? That was the question often asked.

When, on August 21, 1919, the wife of the Secretary of the Navy pressed the button and the water flowed into the docks, and Rear Admiral Parks, head of the Civil Engineer Corps and Chief of the

Bureau of Yards and Docks, and Civil Engineer McKay, both of whom had had a large part in its construction, pronounced it fit and perfect, there went up a shout from the thousands of people present, and a feeling of thanksgiving from the hearts of those who had hoped and labored through the years of doubt.

A MONUMENT TO FAITH, ENGINEERING SKILL, AND EFFICIENCY.

It required 10 years for the finished work, and is a monument to faith, engineering skill, and efficiency in construction. Its construction was essential to naval operation in the Pacific in the day of mighty dreadnaughts. It is invaluable also to the increased and increasing fleets of merchant and passenger ships of our own and other nations which will, more and more, ply the Pacific. The opening of the Pearl Harbor Dry Dock must be followed by the expansion of the navy yard, coaling and oil plant, and other naval facilities in Hawaii, destined to be an important naval base.

NEW TYPE SHIPBUILDING DOCK AT PUGET SOUND.

A dock was completed on January 31, 1919, at Puget Sound, which is an innovation in American practice. This is a shipbuilding dock 936 feet long, 130 feet wide, and 18 feet deep. It affords ample space for the construction of two destroyers at one time. When building is completed, the dock is flooded, and the ships float from the blocks instead of being launched. The dock is served by two 20-ton hammerhead cranes, one on each side. The cost of the entire project was about \$600,000.

MANY IMPROVEMENTS IN NAVY YARDS.

A "yard development" program, improving navy yards for the construction of warships and more efficient industrial activities, was prosecuted throughout the term of the war, and is still going forward. The outlay of about \$27,000,000 has resulted in many new and important developments in the most important navy yards.

IMMENSE CRANE INSTALLED AT PHILADELPHIA.

At the Philadelphia Navy Yard a crane is being completed at the fitting-out slip, the capacity of which ranks among the largest ever built. Having a lifting power of 392 tons, it will be capable of handling larger assemblages of battleship machinery than have hitherto been installed as units. This crane is of the revolving hammerhead type, and stands 230 feet high, the height of a modern 16-story office building. The bottom chord of the revolving truss clears the

ground by 170 feet. An interesting detail of this gigantic piece of mechanism is that the operating house, 200 feet in the air, has a height equivalent to two stories, and is itself equipped with a 35-ton crane for handling the operating machinery. The contract for this crane was let on December 27, 1917, and work has proceeded steadily since that time.

FLOATING REVOLVING CRANE AT MARE ISLAND.

A floating revolving crane of unusual capacity was put into service at the Mare Island Navy Yard during 1919. It is used for ship-building, repair, and fitting-out purposes, and is capable of handling a 150-ton load at an overhang of 62½ feet from the side of the pontoon. The elevation of the hook under such conditions is nearly 100 feet, so that the crane is capable of handling extremely heavy loads, revolving them to position, and stowing them aboard ships of the highest freeboard. The maximum upward reach of the jib is approximately 200 feet. The machinery was furnished at a contract cost of \$480,000, and the pontoon was manufactured and machinery installed by the yard force. The Navy possesses an almost exactly similar crane at Norfolk, and few floating cranes are known either in this country or abroad which exceed these two in capacity or general utility.

STORAGE FACILITIES AT FLEET BASES.

Storage projects of huge proportions were constructed during the war. A fleet supply base at Brooklyn was erected at a speed of 10,000 square feet per day, was completed well ahead of the armistice, and met the requirements of all naval and transport and cargo operations in the northern Atlantic during the war and in the period of great demands after the armistice. It embraces two storehouses eight stories high, 700 feet long by 200 feet wide; two warehouses of a combined floor capacity of 235,000 square feet; a 3,000-horsepower power house—all built of reinforced concrete; 10 miles of railway, and two float bridges.

The storehouses and other improvements now building at the naval operating base at Hampton Roads, Va., will provide extensive storage and supply facilities which are possessed by few naval bases in the world.

PERSONNEL—DEMOBILIZATION AND RECRUITING.

There were half a million enlisted men and more than 32,500 officers on active service in the Navy and Naval Reserve Force when

hostilities ended in November, 1918, and it has been a difficult problem to release from active duty, as rapidly as was desired, men anxious for discharge, and at the same time retain enough to man the ships it was necessary to keep in operation.

The great task imposed on the Bureau of Navigation during the war did not end on November 11, 1918. The duty only changed. Demobilization and preservation of records, recruiting, and other of its functions have been and are most important. I recommend that the name of this bureau be changed to the Personnel Bureau, and that its duties be confined to the personnel. The present name is a misnomer. When the term Navigation Bureau was chosen it was a fitting designation. Then operation and the personnel for operation were united under the Bureau of Navigation. Now Navigation has no duty with reference to navigation except to supply the officers and men, and, the reason for the name having ceased, I recommend that it be given a title truly descriptive of its functions in the present-day Navy. When the Navy was small, efficiency was promoted by orders to ships and orders to men coming from the same bureau. To-day it is necessary for the Office of Naval Operations to have a large force to direct the operations of the fleets and ships and kindred duties, and the personnel has grown so large that it likewise requires a large staff of officers and clerks to direct the command and manning of the ships.

MANY CREWS REQUIRED TO MAN TRANSPORTS.

Bringing home the troops of the American Expeditionary Force required more transports than were utilized in taking them to Europe, less foreign tonnage being available, and these transports had to be manned and operated by the Navy. Navy-manned cargo ships had to be kept in service for months to carry supplies to Europe, many of them transporting cargoes shipped by the United States Food Administration for relief of the civilian population of European countries, others supplying our forces remaining abroad and bringing back war material and equipment returned to America. Of equal importance was the necessity of keeping on the fighting ships crews sufficient to meet any situation that might arise.

PROGRESS OF DEMOBILIZATION.

But despite these requirements demobilization has been rapidly accomplished, as is shown by the following table of men discharged from service or released from active duty from November 11, 1918, to November 1, 1919:

	Regular Navy.	Naval Reserve Force
Nov. 11-30, 1918.....	972	172
December, 1918.....	5,307	24,814
January, 1919.....	8,239	51,866
February, 1919.....	11,587	37,610
March, 1919.....	8,026	24,522
April, 1919.....	3,498	15,588
May, 1919.....	2,570	23,522
June, 1919.....	6,462	32,029
July, 1919.....	10,499	20,485
August, 1919.....	24,023	25,833
September, 1919.....	25,879	17,550
October, 1919.....	17,983	12,639
Total.....	125,045	286,630

OVER 440,000 MEN AND OFFICERS RELEASED IN A YEAR.

Of the total of 30,835 commissioned and warrant officers in the Naval Reserve Force, 29,026 had been released by November 1, 1919, only 1,809 remaining on active duty, these being released daily as their services can be dispensed with. While there were only 20,811 reserve officers on active duty November 11, 1918, about 9,000 were under instruction at officer material schools and other institutions, and these were, on completion of their training, given commissions or warrants and released to inactive duty. Of the Regular Navy, 2,006 resignations of temporary officers and 195 of permanent officers have been accepted.

Thus, in a little less than a year, 411,675 enlisted men had been discharged or released from active duty, and 31,227 officers' resignations had been accepted.

ELEMENTS THAT HAD TO BE CONSIDERED.

In demobilization the following elements had to be considered:

1. *Members of the Naval Reserve Force on active duty.*—These were liable for duty under the law only during the continuance of the national emergency. Presumably the emergency would be at an end with the ratification of the peace treaty. But the peace treaty has not been ratified and there remain less than 5,000 reservists on active duty out of a total of nearly 300,000. These men were placed on inactive duty instead of being disenrolled or discharged from the Naval Reserve Force, as it is not desired to sever them from the Reserve.

2. *Members of the Regular Navy who had enlisted for the duration of the war only.*—Of these, there were about 45,000 who had enlisted after January 11, 1918.

3. *Members of the Regular Navy who had voluntarily enlisted for the first time for the regular four years or minority enlistments at a date subsequent to April 6, 1917.*—Strictly speaking, these men could be held until the completion of their full term of enlistment, but it

was believed unjust to require this, for most of them had enlisted from the highest motives of patriotism for war service only and had signed for four years only because they thought they had no other choice. Under the law, they could be discharged by special order of the Secretary of the Navy but could not be given an honorable discharge. A special provision, retroactive, was contained in the act of July 11, 1919, giving honorable discharges to such men who were otherwise eligible.

JUSTICE TO MEN OF REGULAR NAVY.

4. *Members of the Regular Navy of the same description as in the preceding paragraph who had enlisted between February 3, 1917, and April 6, 1917.*—During the progress through the Senate of the naval appropriation act for 1920, it was pointed out that the rush of enlistments had begun when we broke off diplomatic relations with Germany, and that such men should be considered as war-service men quite as much as those who had waited until war was declared before enlisting. When this feature was embodied in the law, the department included these men with those of the preceding categories, as specified in earlier orders.

5. *Members of the Regular Navy whose enlistments had expired during the war and who had immediately reenlisted from patriotic motives.*—While some of these men might have reenlisted in any event, a great many certainly would not have done so, particularly in view of the opportunities for employment at larger pay in civilian pursuits ashore or in the merchant marine. The Navy owed quite as much consideration to these men as it did to any of the preceding categories and in justice had to treat them all alike.

6. *Men who had enlisted under a provision of the act of August 29, 1916, which was repealed March 3, 1917, whereby they could be discharged after a year's service, in December and June.*—Owing to the war, no one had ever been discharged under this provision.

Among other factors in which men of all the foregoing categories were involved which were especially considered were: Those who desired release in order to continue their education; those who had dependents whom they could not satisfactorily support on the Navy wage; and those who had jobs held open for them in essential industries, or were urgently needed in their business.

SUCCESSIVE STEPS IN DEMOBILIZATION.

On November 21, 1918, an order was issued authorizing the release of 20 per cent of the total number of naval reservists plus duration of war men, except in certain ratings in which there were shortages:

followed on November 29 by authorization of the release of 10 per cent of men enlisted for first time between April 6, 1917, and January 1, 1918. On December 13 all ratings were included except Hospital Corps men and radio electricians, and it was announced that 5 per cent per month of these two ratings would be released.

On January 6, 1919, release was authorized of 20 per cent Naval Reserve Force, 20 per cent duration-of-war men, 10 per cent of men first enlisted between April 6, 1917, and January 1, 1918, and 5 per cent of Hospital Corps men; these percentages to be based on numbers remaining after previous quotas had been let go. All restrictions in ratings were removed, except as to Hospital Corps men. On and after February 20 commanding officers were allowed to release 3 per cent per month in excess of authorized quotas to meet urgent cases. Instructions were issued to commandants to reduce the number of men ashore by transfer to sea duty, and quotas of releases from sea-going ships were increased, on May 7, to 6 per cent for May and June, this with a view to having total personnel reduced to 250,000 by July 1. On June 5 commandants and commanding officers were directed to reduce by 10 per cent the enlisted personnel under their command.

VOLUNTARY TRANSFER TO NAVY AUTHORIZED.

The naval appropriation act of July 11, 1919, authorized the voluntary transfer to the regular Navy, with accompanying benefits, of men who would otherwise be eligible for release, and made the initial date of what may be termed "war service" enlistments February 3, 1917, and this date, instead of April 6, 1917, was used in subsequent instructions issued.

An order was issued July 23 directing release, as rapidly as the clerical work involved would permit, of all naval reservists, duration-of-war men, and also those who had enlisted or reenlisted for four years between February 3, 1917, and November 11, 1918, and had changed their enlistment to "duration of war status," who would not avail themselves of the benefits provided by the new naval act. Vessels of the transport force were exempted. Clerical forces were to be maintained at sufficient strength to expedite handling of demobilization. Commanding officers were authorized to release 20 per cent of the Hospital Corps men during August, September, and October, except those serving abroad, where 6 per cent of releases were authorized, and in addition any who could be spared without relief, and on September 29 this was extended to all who could be spared. On October 7 instructions were extended so as to direct release of all enlisted men, on their written request, who would not

take advantage of benefits to join the regular service nor agree to continue their present status of service until released in the future.

PAYING BONUS AND TRAVEL ALLOWANCE.

The act of February 24, 1919, granting a \$60 bonus to all men honorably discharged or released and the act of February 28, 1919, granting 5 cents per mile travel allowance, both retroactive, introduced additional problems in demobilization. To meet this and other requirements, seven of the more important recruiting stations in the interior of the country were specified as additional demobilization stations. Such numbers of men were being released or discharged at the seaboard cities as to cause great congestion and it was desired to increase the demobilization points.

Duration-of-war men were not allowed transportation under previous law. So many men were stranded in New York that the Bureau of Navigation, through its transportation section, opened a temporary office in that city, for the purpose of getting these men to their homes. This office provided transportation, and instructed the men how to secure the balance due them of the 5-cent-per-mile allowance. It also paid the \$60 bonus to a number of men. In all, about 3,000 were handled at this office.

MANY TEMPORARY OFFICERS RESIGN.

In demobilizing enlisted personnel the Bureau of Navigation specified only numbers to be released, leaving the selection of individuals to the commanding officers. The resignations of officers were handled individually by the bureau by travel and release orders. Officers, as a rule, were not so anxious to be demobilized as were enlisted men. Generally speaking, the pressure brought to bear upon the bureau has been, in the case of men, to get them released; in the case of officers, to retain them on active duty. As the status of permanent officers of the Regular Navy was not involved, those who figured in demobilization were temporary officers of the Regular Navy and officers of the Naval Reserve Force.

The temporary officers were appointed principally from three sources: 1, warrant and chief warrant officers of the Navy; 2, enlisted men; 3, from various classes of the Naval Reserve Force. Groups 1 and 2 are still nearly all on active duty in the temporary ranks attained by them during the war. From group 3 came many requests for release, presented as resignations. Up to November 1 the following resignations from the Regular Navy had been accepted:

	Temporary.	Permanent.
Line.....	1,562	2
Medical Corps.....	181	131
Supply Corps.....	20	57
Construction Corps.....	7	5
Chaplains.....	6	
Civil engineers.....	3	
Warrant officers.....	227	
Total.....	2,006	195

RESIGNATIONS AND COMPENSATION.

Quite a number of commissioned officers have resigned, a few warrant officers, and many petty officers. The latter, upon whose efficiency so much depends, have been offered very greatly increased pay on shore or in the merchant marine, and, though they preferred the Navy, duty to their families compelled them to separate themselves from the service. To a lesser degree the same compulsion has caused commissioned officers to resign. While a large number received temporary promotions during the war, carrying with it increased compensation, there has actually been no increase in the pay of officers since 1908. The necessity of separation from home, frequent changes of duty involving heavy expense, and the high cost of living have borne heavily upon the officers who have no means of support except their pay and allowances. They are unable to think of, much less engage in, any gainful pursuit.

I have earnestly recommended to Congress a continuance of the commutation allowed to officers afloat during the war and a graded increase in pay, particularly to officers in the ranks where the yearly pay is not large. The present high prices make such increase necessary, and I hope it will be speedily granted both as a recognition of the high efficiency and because it will enable the officers to continue their strenuous duties without the self-denial to their families which the present conditions have imposed.

NAVAL RESERVE OFFICERS RELEASED.

For approximately four months following the cessation of hostilities reserve officers were released upon their own application as rapidly as the necessary orders could be prepared. After that period it became necessary in many cases for the department to take the initiative and release those officers whose services could well be spared. The naval appropriation bill, approved July 11, 1919, fixed the number of commissioned reservists employed on active duty for definite periods, and reserve officers whose services were not absolutely necessary or could be spared without serious harm to naval activities were released.

RESERVES PROVE THEIR WORTH.

Congress should make ample provision for retaining and strengthening the Naval Reserve. We could not have manned the ships and carried on the war without them. They deserve the warmest praise and commendation. Many of them demonstrated leadership and ability of a high order, were placed in responsible positions afloat and ashore, and were animated by the true Navy spirit of giving the best service.

RECRUITING CAMPAIGN PROVING SUCCESSFUL.

Second only to the efforts to release the men who wished to get out of the service have been the efforts to get men into the Navy. With the first steps of demobilization came the realization that, unless active measures were taken to build up the personnel, it would fall below the strength required to keep our ships in proper condition. After the passage of the universal service law extending the age limits of 21 to 31 to 18 to 45, the Navy ceased recruiting and secured its recruits by induction through the draft boards.

On December 2, 1918, the President authorized the resumption of voluntary enlistments for the Navy, and on the following day an order was issued restoring its recruiting stations and districts, and directing resumption of enlistments. The former recruiting offices had not been closed but had been used as mobilization points for receiving inducted men.

STATIONS IN EVERY PART OF THE COUNTRY.

In the recruiting campaign many additional subrecruiting stations were opened up. At the present time there are 5 main and 17 substations in the New England district, with headquarters at Boston; 13 main and 62 substations in the eastern district, with headquarters at New York; 5 main and 33 substations in the southeastern district, with headquarters at Atlanta; 7 main and 40 substations in the central district, with headquarters at Chicago; 6 main and 33 substations in the west central district, with headquarters at Omaha; 6 main and 35 substations in the southern district, with headquarters at New Orleans; and 7 main and 47 substations in the western district, with headquarters at San Francisco.

SHIPS IN PORT AUTHORIZED TO RECRUIT DIRECT.

In addition to the work of the recruiting stations, extraordinary measures have been adopted. Ships in port have been authorized to enlist recruits and to retain such men on board for training and duty and have been directed to furnish recruiting parties to co

operate with local recruiting stations. Recruits so obtained have been sent to the ship concerned. One dreadnaught, the *North Dakota*, added to its personnel 456 men which were recruited by its own officers and men, setting an example for all ships in the fleet.

ANTISUBMARINE BOATS AND AIRCRAFT SENT ON TOURS.

As the Navy in seeking recruits must compete to some extent with the demand for men in civilian employments, it has been necessary to use special efforts to stimulate recruiting. An antisubmarine flotilla, which included patrol boats and aircraft, was sent up the Mississippi River and tributaries, and aroused great interest in that region. The seaplane *NC-4*, which made the trans-Atlantic flight, was sent on a tour of ports on the Atlantic and Gulf coasts. A recruiting train was sent through the Middle West, and naval exhibits were sent on a tour of leading State fairs.

A newspaper advertising campaign has been begun involving \$300,000, and wide publicity has been secured through the public press, moving pictures, posters and booklets and articles describing life in the Navy. A special school has been established for the training of recruiting personnel.

60,000 RECRUITS SECURED—MANY REENLISTMENTS.

As a result of these efforts, some 60,000 recruits have been enlisted, approximately 2,000 reservists transferred to the regular Navy, there have been nearly 13,000 reenlistments, and some 17,718 enlistments have been extended. Recruiting was resumed December 3, 1918, and in that month there were 1,684 first enlistments and 757 reenlistments. The progress of Navy recruiting during the present year, to November 1, is shown in the table below:

Month.	First enlistments.	Transfers from reserve.	Reenlistments.	Total.	Extensions of enlistments.	Grand total.
January.....	5,067		956	6,023	20	6,043
February.....	5,730		697	6,427	27	6,454
March.....	5,819		605	6,424	48	6,472
April.....	6,242		650	6,892	18	6,910
May.....	5,677		711	6,388	31	6,419
June.....	4,482		607	5,089	17	5,106
July.....	6,939	147	1,026	8,112	7,460	25,269
August.....	6,434	645	2,618	9,697		
September.....	5,980	585	2,353	8,918	6,936	15,854
October.....	5,970	612	1,782	8,364	3,161	11,525
Totals.....	58,340	1,989	12,005	72,334	17,718	90,052

SERVICE APPEALS PARTICULARLY TO YOUNG MEN.

Considering the difficult task placed before the recruiting service, the performance of the last few months has been very satisfactory and should continue so.

The Naval Service seems, at the present time, to appeal particularly to very young men, and most of the recruits obtained are just over the minimum age limit. Although these men are inexperienced, there is no doubt that with proper training they will develop into excellent men-o'-war-men.

PERMANENT TRAINING SCHOOLS.

During the war three of the permanent training stations were greatly expanded to meet present and future needs. Through them and the other stations there passed not less than 200,000 young Americans, who were taught the first rudiments which stood them well in hand when they later saw service afloat. These schools at Chicago, Norfolk, and Newport are much too large for present needs. The buildings not now in use are being preserved, ready for the occupancy of reserves who will be invited to take short courses of training each summer. For this purpose the excess in housing will be well utilized and will constitute an asset.

In these three and the other permanent training station at Yerba Buena, San Francisco Harbor, and in the temporary stations, a few still in operation, there are schools which give educational advantages to all young men who enlist in the Navy. They are taught arithmetic, reading, geography, grammar, and prepared for Naval Academy examinations. Instruction is given in every trade and occupation in the Navy, in aviation and mechanics and kindred subjects as well as in ordnance and aviation, pharmacy, stenography, nursing, cooking—in fact, in every branch of naval knowledge.

These schools are excellent, and many youths have emerged from this four or five months of instruction with a new capacity to learn and new ambition and better ability to do their part in making a better Navy. Education in the Navy is the first and last word—education called theoretical, and practical education. Youths denied the opportunity of education in civilian life can, by earnest application, increase their education in the Navy while earning their living. With increased knowledge and capacity comes advancement with larger pay, and there is no limit to advancement for youths of purpose and good minds.

2,086 MIDSHIPMEN AT NAVAL ACADEMY.

The Naval Academy, now that the additions to Bancroft Hall have been completed and occupied, gives accommodation to more than 2,000 midshipmen, and 2,086 were present at the opening of the fall session. Of these 709 were new men, making up the largest fourth class in the history of the Academy. The new wings of Bancroft Hall are of the same material and architecture as the original

building, and as completed this large and magnificent structure is dignified, stately, and ideally constructed for its uses. There were 460 graduates in the class who received their diplomas last June, whereas the number was 182 in the year preceding the war. The need for officers was foreseen before war was declared, and the course reduced from four to three years. The full four-year course has now been restored.

YEAR'S SERVICE IN RANKS WOULD BETTER FIT FOR COMMAND.

Now that the close of war lessens the pressing demand for officers it may be possible to carry out a policy long considered of increasing the course to five years, one year to be spent afloat as an enlisted man to learn the practical lessons below decks, which would be invaluable to every officer. No officer can command so well as the man of ability and knowledge who knows every character of service, from polishing the brass on board ship to the highest strategy and tactics.

FORMER ENLISTED MAN LED CLASS OF 1919.

The careers of the midshipmen who were appointed from the ranks has more than justified this departure from the old policy. The star graduate in the class of 1919 obtained his appointment by merit from the enlisted ranks. Other things being equal, such experience helps in the making of an officer. Fewer enlisted men have secured appointments as midshipmen than was expected because the stress and rigorous service of war left little or no time for study and preparation. Opportunity for instruction for ambitious youths in the service is now given to all who make application to stand the entrance examination.

FAVORS COMPETITIVE SYSTEM IN CONGRESSIONAL APPOINTMENTS.

The Board of Visitors in its valuable report (see Appendix K) reaffirms its recommendation that examinations for admission in the several congressional districts be by competitive examination, rather than by appointment without competition, by Senators and Representatives. They truly declare the competitive method "more democratic than the one now commonly practiced" and are convinced that it "would provide better candidates." In both respects they are eminently right.

One of the objections to the present system is that too large a number of young men solicit and obtain appointment primarily for the purpose of obtaining the excellent education which the Academy affords. Some of these youths have no love for the sea, no taste for the naval profession, and lack that zeal and enthusiasm for the life which is necessary for the highest attainment.

Appointment from the ranks is the best and the most democratic method and assures the matriculation only of young men with zest for naval service. The day will come when all young men desirous of joining this noble profession will obtain appointment to the Academy only by graduation from the enlisted service. But if Congressmen feel that such a radical departure might deny equal representation to every district and every State, which is to be desired and ought not to be lost, provision could be made by which the representation could be divided among the States, as now.

If, however, Congress insists upon naming the midshipmen from their States or districts, I venture to urge that the appointment be made by competitive examination rather than by personal selection. Most Congressmen name fit and worthy young men, but those who leave the field open to all aspirants have been gratified by the results, and the naval authorities have found that it gives us better officer material. As a rule the youths who win solely by merit are better prepared and have more enthusiasm and zeal.

PRACTICE CRUISE ON BATTLESHIPS.

Until a whole year's service in practical service afloat can be put into practice, the policy of an annual summer practice cruise on battleships is carried out. The results are excellent. During the past summer the cruise with the midshipmen embraced a voyage in the West Indies, to Guantanamo, through the Panama Canal, up the New England Coast and to Hampton Roads for target practice. Six battleships under command of Rear Admiral Roger Welles made the cruise, and the training in seamanship, gunnery and the actual duties aboard ship constitute experience that helps greatly in making the young men ready for their later duties as officers afloat.

THE POST-GRADUATE SCHOOL.

The post-graduate school for officers, adjourned during the war, has been reopened at Annapolis in model quarters in the building originally erected for marine barracks. During the war this building was used for the instruction of reserve and young officers. Forty-eight officers have taken the course since the reopening and under the able direction of Capt. E. J. King and capable assistants it is a stimulating course which it would be well if every officer in the Navy could enjoy in the early years of his career. A naval officer must have more kinds of knowledge than a man in any other profession, and it is the purpose of this school to afford the rounding out of naval education and opportunity for specialization.

NEARLY 1,000 RESERVE OFFICERS TRAINED.

The Academy has not only graduated 1,040 officers for the Regular Navy since March, 1917, but it gave special instruction to five large classes of specially selected reserves who were thus enabled to speedily perform important duties during the war, some of whom demonstrated such naval efficiency that it is hoped they will become a part of the permanent naval force. The number of line officers graduated was 1,730, while 200 staff officers also became ensigns after duty and examination.

IMPROVEMENTS AND EXTENSIONS.

The most important improvement to the Naval Academy has been the completion of the two extensions to Bancroft Hall, each 387 feet long by 54 feet wide, and each having two subsidiary wings 87 feet long by 46 feet wide. Begun on July 30, 1917, work was entirely completed six months ago, at a total cost of \$3,925,000. They provide 574 additional rooms for midshipmen, 52 rooms for use as class rooms, offices, etc., and enlarged spaces for the laundry and tailor shop.

SEAMANSHIP AND NAVIGATION BUILDING.

To provide additional classrooms and lecture rooms and laboratories for the departments of seamanship and navigation, made necessary by the increased number of midshipmen, a building for use of these two departments is now under construction, which it is estimated will cost about \$750,000. The building adjoins the present gymnasium, is of reinforced concrete and granite 327 feet long by 68 feet wide, and of the same general type of architecture as the gymnasium and the midshipmen's quarters. Provision is made for 45 classrooms, lecture rooms, and rigging loft.

To provide additional classrooms, shops, and drafting-room space, an addition to the present Isherwood Hall was constructed at a cost of \$285,000; and extensions were also made to the forge shop and foundry. The new reinforced concrete sea wall was completed in September; the central power plant has been enlarged to supply the new buildings; new artesian wells provide abundant good water; there are new and adequate storage plants, with a new garage; and the material development of the plant has kept pace with the increase in the number of midshipmen.

HOUSES NEEDED FOR TEACHING FORCE.

The problem of housing grows more and more acute. The teaching force has necessarily been increased. It is not possible to secure houses in Annapolis, and the need for homes for the teaching force, officers,

and professors, calls for the construction of new houses. Millions have been spent for dormitories and classrooms and lecture halls, but adequate provision has not been made for the teaching and training personnel. While the proper rounding out of the site would make the acquisition of the city lots adjoining the chapel most desirable, there is sufficient land in the grounds of the Academy for the buildings needed to house the teachers and their families.

NEW CHAPEL WOULD BE FITTING WAR MEMORIAL.

The chapel, once large enough to seat all the midshipmen, is now much too small, and religious services are conducted in both the chapel and in Bancroft Hall. The day is not far distant when it will be the part of wisdom to erect a chapel large enough for all the midshipmen to worship together. It must be architecturally in keeping with the other structures, and when it is completed the present chapel, unsuited for religious services and unfit by reason of bad acoustics, should be converted into a memorial building and museum. Plans for such change are in preparation and will be ready when Congress indicates that it will make the necessary appropriation. It would be a fitting memorial in appreciation of the splendid sacrifice made by the officers and men of the Navy in the World War as well as in its entire history from the days of Barry and Jones.

STAMPING OUT HAZING IN ITS INCEPTION.

Early in the present session there came rumors of a recurrence of hazing, arising out of the fact that two midshipmen attempted to commit suicide, and an increased number tendered their resignations. Investigation proved that there was no hazing as that term is understood by the student body, but there still existed a species of hazing called "running," which was unauthorized and indefensible.

Rear Admiral Scales, the capable and wise superintendent of the Naval Academy, Commandant Cluverius, and other officers, who enjoy the confidence and esteem of the student body, have met with the hearty cooperation of the midshipmen in removing any cause for criticism. All the midshipmen of the three higher classes have signed assurances that no hazing, or running, or anything in the nature of assuming authority over the youths in the entering class would be practiced or tolerated. It was established that neither hazing nor running was responsible for the attempted suicides.

CAUSES OF NUMEROUS RESIGNATIONS.

The resignations were due mainly to the same causes that have produced unrest in all the world since the close of the war. Many young men, under the impulse of war fervor, entered the Academy,

wishing by naval training and naval service to serve their country. When the impulse of war service passed they found that they were better qualified for civilian occupations and wished to prepare themselves for some other profession.

There has been no hesitation in accepting the resignations tendered, with the approval of their parents, of such young men. They will be better citizens and more useful in a calling which they love than to continue in the Navy where they would do well but not do their best. It is easy to secure all the ambitious youths who have a genuine love for the sea without keeping those whose heart lies elsewhere. In other cases resignations have come from midshipmen who find it difficult or impossible to keep up with some branch of instruction. With more than 2,000 at the Academy, the acceptance of such resignations in their first year is best for the youths, best for the Navy, and best for the country.

A subcommittee of the House Committee on Naval Affairs visited the Naval Academy when there were reports of hazing, made an investigation, and came back with high commendation for the authorities and their spirit and action.

HAZERS WILL BE SUMMARILY DISMISSED.

Parents were gratified when the student body, of their own free will, honored themselves by guaranteeing freedom from hazing or running, or anything similar, at the Academy. Hazing in any form is indefensible when practiced in a civilian institution of learning. It is unthinkable and intolerable in an institution in which young men are received as potential officers, educated at the expense of the taxpayers, and whose first duty is obedience to authority. Without rendering this obedience to the laws of Congress, they are unfit to command, and it is better to have a few hundred men who are learning to obey in order that they may wisely command than 2,000 if that number embraces those who find pleasure in violating instructions and disobeying laws.

THE NAVAL WAR COLLEGE.

The only efficient naval officer is the student. From the day of entrance to retirement every successive promotion comes only after examination and selection of the fittest for the higher command. There is always the dual temptation to men of differing temperaments. The man who loves books and has a mind for study pursues this bent, sometimes making it paramount to the practical duties, becoming what in naval phraseology is termed a theoretical officer. The other type, who loves the salt and is immersed in navigation and engineering and making the machine go round, has before him the

temptation of not finding time to keep abreast with naval thought as found in the writings of naval statesmen. He becomes an old-fashioned sea dog, who can do anything on or with his ship, but lacks the wider knowledge that should be superimposed upon efficiency afloat.

MOST EXACTING OF PROFESSIONS.

The naval profession is more exacting than any other. The tendency in medicine, in law, in all professions is toward specialization. No longer does the physician do general practice. He confines himself to certain specialties or diseases. In the navy the officer must be equally skilled as a navigator, electrician, engineer, gunner, plotter, executive, and must be familiar with international law and usage, as well as be posted in the latest strategy and tactics of land as well as sea warfare. In most other navies the line officer is not expected to be an engineer, but with us the call is for the captain of a ship to have mastered all the trades before reaching command, and the policy is to assign every officer during his career to every character of duty so that in emergency he may go into the engine room or the electrical department and be as fully at home as when he navigates the ship and directs its whole activities. This demand requires intense application and varied experience, leaving little time for specialization deemed essential for the highest efficiency.

AT THE APEX OF NAVAL EDUCATION.

At the apex of naval education is the Naval War College at Newport, R. I. The need of such a course and such an institution had been long felt by the ablest officers in the Navy, led by the late Rear Admiral Stephen B. Luce, who became its first president upon its establishment, on a small scale, in 1884. Its instruction was then limited to three months in the summer, and only a few officers were enabled to take advantage of the course. Admiral Alfred T. Mahan, now recognized through his works as the world's authority on Sea Power, was invited to become a member of the staff of the infant college.

MAHAN SAW GREAT OPPORTUNITY FOR SERVICE.

In answer to the invitation, he wrote from the U. S. S. *Wachusett*, at Guayaquil, September 4, 1884:

I should like the position, like it probably very much. I believe I have the capacity and perhaps some inherited aptitude for the particular study; but I do not, on questioning myself, find that now I have the special, accurate knowledge that I should think necessary. I fear you give me credit for know-

ing more than I do, and having given a special attention to the subject, which I have not.

I take it the subject proposed to me involves an amount of historical narrative, especially directed toward showing the causes of failure and success, and thus enforcing certain general principles. Whether to this is to be added any attempt at evolving systems of tactics applicable to modern naval warfare, I don't understand; but I suppose by naval tactics you scarcely mean a reproduction of Parker. Taking simply the first subject, as I turn over in my mind the naval battles, and naval and mixed expeditions, scattered through history, and think how little I know about them in detail, the work assumes very great proportions. To look up the authorities, master them, and digest and arrange the material thus acquired, bring together examples illustrating the same lessons, above all the criticism, every one of these steps is big. Yet, if I rightly understand the subject, no less could be considered adequate treatment. And then how large a mass must be gone through and in the end found useless.

As to preparation here on board ship, it is impossible. I have looked through the ship's library and find little material and less that is first rate. I can go through it all in a few weeks. Besides, I should have to give my whole mind to the matter, which in command (of a ship) is impossible. No man is less able to serve two masters.

My reply to you, then, is "Yes"; I should like to come if, after reading my letter, you still wish it. Indeed, I don't think I would be right in refusing to help in a new, difficult, and most needful work if, in the judgment of others, I can be useful. Meantime * * * I will work up what is at hand as though the matter were settled.

THERE WROTE STANDARD WORKS ON SEA POWER.

It was the opportunity afforded at the college, where few officers matriculated, and therefore there was leisure for the task, that may be said to have given the world Admiral Mahan's works, which are everywhere regarded as the last word in naval lore. His books may properly be called a product of the War College in its early days. Their teachings have been of such value that it may be truly said they have more than repaid the country for the entire cost of this institution.

The successors of Luce and Mahan labored industriously to make the course at the War College as essential as a tour of duty ashore or afloat, but it was years afterwards before any naval administration adopted that idea; and, just as it was becoming a fixed policy, the new and imperative demands for emergency service compelled it to wait upon peace.

ADMIRAL SIMS RETURNS TO PRESIDENCY.

Soon after the signing of the armistice, when the main duties for which he had been sent abroad in 1917 were ending, Admiral William S. Sims was reassigned to the position of president of the War College. Shortly before the war, at the termination of sea service as commander of the destroyer flotilla and in command of the new

dreadnaught, the *Nevada*, Capt. Sims had been assigned to the presidency of the War College before he was promoted to rear admiral. He had the vision of an enlarged and greater place in the Navy for the college, which he was translating into actual reality when the war made it necessary for him temporarily to take up a service of the highest importance to this and the allied nations.

GENIUS IN INSPIRING YOUNG OFFICERS.

In addition to his ability and brilliant achievements he had shown a genius in inspiring and stimulating young officers of the Navy, and nowhere could he exercise this gift so as to touch the whole fleet as in leadership in the study of tactics and strategy at the War College. It was because of his deep interest in progress and advancement of naval officers that, upon completing his mission abroad, his preference was to take up the work he had laid aside for active war service. He therefore entered upon a second term as president of the college in the early summer of 1919.

The Bureau of Navigation was directed to send 30 officers to take a full year's course at the college and to select as members of the class men who had demonstrated qualities that indicated fitness for command. Another class of 30 enters on December 1, which will give an attendance of 60 officers, with 509 other officers taking the correspondence course. This is in marked contrast with the lack of interest felt in the college in 1911 when only four officers were assigned to take the year's course.

CORRESPONDENCE COURSE VALUABLE TO OFFICERS.

There is sound reason why every officer should take the correspondence course, preparatory to later taking a course at the college if opportunity offers, or, if denied the privilege of attending the institution, of keeping up with the large problems studied there. The War College does not fulfill its mission unless the results of its games and instruction reach the whole fleet, and to that end, while no compulsory orders require officers to take the correspondence course, every ambitious officer should do so. Other things being equal, the man who masters what is taught and learned at the War College is more fit for high command than he who fails to add that preparation to active experience and practical operation of ships or fleets.

WILL BE NECESSARY TO HIGH COMMAND.

The day will come, after full opportunity to receive this college instruction is within the reach of all, when one of the requisites to command of a battleship, division, squadron, or fleet will be a diploma of graduation at the War College. This does not imply that in this

period preference shall be given to men with such training over officers of great ability who have demonstrated leadership though not privileged to attend the college. But the day is near at hand when, with opportunity to take the course, the Service will recognize it as giving superior knowledge and fitness. Two of the admirals of the three fleets have attended the War College, as have all the vice admirals and a number of the rear admirals. In the attendance now are included younger rear admirals and captains of high rank, who recognize that before they go afloat in command they will be greatly helped by mastering the course.

TO FURTHER DEVELOP "SCHOOL OF THE FLEET."

Valuable as its work has been in the past, the Naval War College has never been given the place of importance it should occupy in the training of naval officers in the art of conducting a naval war. We spend years of time and millions of dollars in teaching officers the rudiments of their profession, in fitting them for the performance of their duties on board a particular ship, and in these "duties of the ship" the Navy has developed a high state of efficiency. In accuracy of hitting at long ranges in target practice, in economy and efficiency of our engineering performances, and in all the things which go to make a single ship an effective fighting machine, whether it be a submarine chaser or the latest dreadnaught, we have obtained results of which we may well be proud. But the study of the problems in connection with the many possible conditions that would exist in time of war or threatened attack, and practice in solving these problems have not kept pace with the study and solution of the problems arising in the single ship—in other words, the "School of the Fleet" has not advanced as far as the "School of the Ship."

JOINT ARMY AND NAVY COLLEGE SUGGESTED.

The higher study of war by Army and Navy officers is alike in so many respects that both should study the same strategy and tactics. One war college for both, with separate sections for land and sea strategy, would be of such value that I venture to suggest that Congress might wisely consider establishing such a joint institution.

TO MAKE "HAPPY SHIPS" AND CONTENTED MEN.

One of the most important developments of naval thought and activity during the past year has been the establishment of the Sixth Division, Bureau of Navigation, an organization which has to do solely with the welfare and morale of the officers and men of the Navy. The vital importance of the human element is recognized, and from the efforts of this organization, composed of carefully

selected naval officers and men, the desired result should be attained with economy and efficiency.

One of the greatest of sea fighters said, "A happy ship is an efficient ship," and it is to make "happy" ships and stations with resultant efficiency that this division was organized. The young sailor, deprived of the sheltering influences of home and thrown upon his own resources for the first time, is often bewildered upon his entry in what is, to him, a strange world. Unaccustomed to the routine of naval life, he sometimes finds difficulty in adjusting himself to conditions. When he is given leave, he may be inclined to throw off all restraint, forget the teachings of his home, and commit excesses which may harm him for life.

EXTENDS A HELPING HAND TO THE NEW RECRUIT.

It is necessary, therefore, that a helping hand be extended the recruit as he makes his entry into naval life; that he find a kindliness and personal interest shown him which approximates that of his own home; and that when he goes on liberty, the homes of the community be opened to him. As he grows older and leaves the training station for service at sea, he again enters upon a new world on board ship. A helping hand here, a word of advice, and he soon fits into the organization and becomes an efficient unit.

When he goes ashore he must be given a decent place to visit; he must be made welcome in the homes of the citizens whose safety he guards and the integrity of whose Government he upholds. When the ships sail for foreign lands, he should be instructed as to the things worth while to see in the ports he will visit; not only that he may avoid the pitfalls laid for the sailor's foot the world over but also that his mind may be broadened by viewing with understanding other peoples and countries, their daily life and their treasures of art and history.

PROMOTES ATHLETICS, FURNISHES DIVERSION, TEACHES SOCIAL HYGIENE.

At the fleet bases and navy yards he should be given opportunities for healthful recreation and the development of eye, brain, and hand in competitive athletics. In the evening, when the labors of the day are over, he should be given the pleasure of seeing plays and motion pictures. The young American is ambitious; the peculiar genius of his race expresses itself in a never-ending struggle to rise, to better himself, and a rational system of education should be supplied and so planned that opportunity to learn and to improve is constantly at hand. It is necessary that the importance of social hygiene be taught the sailor, young and old alike. Here must be impressed on him the striking truth of the saying, "The wages of sin is death."

ATTENTION TO SPIRITUAL SIDE OF LIFE.

Men can be given education, travel instruction, helpful advice, competitive athletics, entertainment, social-hygiene instruction, the homes of the communities can be open to them, their minds can be relieved of worry over their families; all these things can be done, but unless the uplifting influence of religious belief is given due place, the greatest good can never be attained. Attention to the spiritual as well as the physical and the mental side of life is vitally necessary if the personnel of the Naval Service is to reach its maximum efficiency.

It is, then, to give helpful advice in the stations and aboard ships; to provide and encourage athletics, motion pictures, travel instruction, social-hygiene instruction, and to stimulate the development of the spiritual life that the Sixth Division is organized. It draws around the men of the Navy a circle in which the good is made more attractive than the evil. There is no suspicion of coddling here; the right of the individual young American to choose his own course of action in life is inalienable. The Navy here gives him the opportunity; the decision rests with him.

REPRESENTATIVES IN DISTRICTS AND TRAINING STATIONS.

The Sixth Division is organized to replace, with officers and men of the Navy, the Commission on Training Camp Activities and its civilian personnel, who, working with other organizations, rendered such splendid service during the war and the period of demobilization. It is an organization in the Navy Department, acting under the Bureau of Navigation, composed of a chief of division and sections as follows: Organization of Communities, Home Service, Religion, Recreation, Education, Dramatic Entertainments, Motion Pictures, Athletics, Travel, Lectures, and Social Hygiene. In each of the more important naval districts, in the large training stations, and in the forces of the Marine Corps there is an officer of rank and experience whose duty is to aid the constituted authorities in maintaining a higher morale; that is, to aid in making the men and officers more contented and therefore more efficient. The value of this organization has already been demonstrated.

BOOKLETS AND LECTURES DESCRIBE PORTS FLEETS VISIT.

The Pacific Fleet on its cruise through the canal carried with it complete illustrated lectures on the construction of the canal, and each man was provided with a booklet which enabled him to understand his cruise. Plans are now under way to provide illustrated lectures on each of the important ports of the world, and to give

to every man going on liberty in these ports a small but comprehensive and instructive guide book which will enable him to get the most out of his visit.

In athletics it is the aim of the division to develop the man who is not naturally an athlete and who is therefore barred from competition for the ship's team. Athletic gear is furnished to these men and every encouragement given them to participate in athletic sports. Plans are under way to bind the men closer to their homes and to open the doors of the communities to them.

MEN IN CHINA AND NORTH SEA PROVIDED FOR.

The men on the upper Yangtze River, in China, 1,200 miles from the sea, are helped by means of a clubhouse which is maintained by the division. The sailors on our mine sweepers which have been removing the mines laid in the North Sea have been adequately supplied with comforts and entertainment. As the division is in close touch with the Office of Naval Operations, every ship which is commissioned or which sails for foreign ports is equipped in ample time. Every Marine regiment which goes to serve in the field is furnished a special outfit. In short, the division is a business-like organization by which the Navy Department expresses its interest in the welfare of the entire personnel, and by which it hopes to realize the ideals of the American people for every man in the Navy.

GRATITUDE TO WELFARE ORGANIZATIONS.

During the war, and in peace, too, the welfare organizations have rendered a service to the young men of the Navy of a value too great to be computed. For many years the Young Men's Christian Association at all cities where young men have been trained has made them welcome in its large and well-appointed and well-conducted buildings. During the war its good work was many times multiplied. In many places that young men gathered to train or to fight, since the beginning of the war, the Knights of Columbus have maintained homes for young men and been helpful in giving recreation, diversion, and have contributed to the betterment of the young men to whom they ministered. In like manner the Young Men's Hebrew Association, the Salvation Army, the Library Association, the Commission on Training Camp Activities, the Red Cross, and the churches of every creed have stimulated right living and been spiritual leaders.

VAST RADIO SYSTEM BUILT UP BY THE NAVY.

Radio communication, essential in time of peace and absolutely vital in war, has never had its importance so signally demonstrated

as in the past three years. If the enemy had succeeded in cutting the cables, radio would have furnished our only immediate means of communication with Europe. During the peace negotiations and the demobilization of our European forces, when the cables were overloaded, our transocean system transmitted millions of words of official dispatches and press reports, rendering a service which could not have been performed by any other means.

GOVERNMENT SHOULD CONTROL ALL RADIO.

The war taught the supreme necessity of quick communication and our dependence upon "wireless." The Government ought, through the Navy, to be in exclusive control of all radio. In war it was seen to be essential and the Navy was given the task, which it performed in a way to make the enemy spy system and enemy propaganda ineffective. You can operate a score of telephone or telegraph wires without interference, and from the standpoint of practical operation there is no argument for Government ownership. With wireless it is different. To secure the best results, indeed to secure good results, when wireless is largely used, the Government must be in exclusive control or it must make it a monopoly in private hands. No other plan, no divided authority, is thinkable in war. No other plan guarantees the greatest success in peace. The department has presented its view fully and clearly upon this question, the importance of which can not be too highly emphasized, in letters to Congress recommending a national policy. Its views are set out in full in these letters, printed in this report as Appendix E.

MILLIONS OF WORDS FLASHED OVERSEAS.

The Naval Communication Office has handled during the past year (estimated at an average of 60 words per dispatch) a total of 71,347,860 words, as follows:

By high-power radio (trans-Atlantic and continental)	16, 215, 423
By coastal radio.....	1, 621, 542
By leased wires, Western Union and Postal.....	53, 500, 895

EXTENDS AROUND MOST OF THE GLOBE.

During the war period the Navy developed a vast wireless service which enabled us to keep in touch with our ships in all parts of the world, maintained continuous and rapid communication between the United States and Europe, South America, Central America, the West Indies, the Hawaiian Islands, Guam, Tutuila and the Far East, as well as between our own Atlantic and Pacific coasts.

To direct movements of convoys and transmit information regarding the enemy and issue orders to naval vessels and merchant

ships, a comprehensive system of transmission from shore was organized, making it unnecessary, except in rare instances, for ships at sea to use their radio apparatus, thus avoiding the possibility of revealing their location to enemy submarines. All United States merchant vessels were provided with Navy operators, to the number of about 5,000, insuring efficient radio service aboard ships.

RADIO COMPASSES AID MERCHANT MARINE.

The system of radio compasses on shore, which was established originally for the detection of submarines, proved such a useful aid to navigation that during the past year additional stations have been constructed. This system, which in war enabled us, by determining the direction and distance of radio messages sent by enemy submarines, to ascertain their location at sea, enables us now to aid ships, in fog or cloudy weather, to determine their position, thereby adding to the safety of navigation.

HANDLED LARGE AMOUNT OF COMMERCIAL TRAFFIC.

Many naval shore radio stations were opened for ship-to-shore commercial traffic on November 15, 1918, all restrictions being removed except from ships in the Atlantic which were west of the fortieth meridian. Since that time all stations have been opened to this traffic and all restrictions removed, there being about 75 shore stations doing active commercial work.

The total earnings for commercial traffic during the past fiscal year amounted to approximately \$437,000. Of this amount there has been turned into the Treasury, under "Miscellaneous Revenues," \$236,210.50. The difference between the earnings and the amount turned into the Treasury, approximately \$200,000, represents the working cash balance of \$25,000 and balances due the Naval Communication Service from other lines and steamship companies.

REOPENED CIRCUIT TO JAPAN AND PHILIPPINES.

Owing to the congestion of the Pacific cables the Naval Communication Service reopened the trans-Pacific circuit to Japan and the Philippines on December 19, 1918. This service took the place of that inaugurated by the Marconi Co. about three months previous to the outbreak of war, the Navy carrying out the service between San Francisco, Pearl Harbor, and Japan. Owing to the large volume of Government business this traffic was restricted to full-rate business only. The earnings from this circuit up to June 30, 1919, were approximately \$188,000.

TELEGRAPH AND TELEPHONE SYSTEM.

At the time of the armistice the telegraph system of the Navy Department included wires from Galveston, Tex., to Bar Harbor, Me. The leased telephone wires of the Navy Department extended from Norfolk, Va., to Portsmouth, N. H. The telegraph office of the Navy Department was handling 4,000 messages per day, and the Navy telephone exchange 18,000 telephone calls daily.

In addition, this division had constructed or leased duplicate wires for distant control of all radio stations and for operation of a large number of radio compass stations. The Naval Communication office was also cooperating with cable censorship, furnishing technical advice and censoring the official messages of the cable companies. This service was rapidly reduced after the armistice, only enough wires and personnel being retained to handle absolutely necessary business.

UNIFIED REGULATION AND CONTROL A NECESSITY.

The chief lesson learned during the war was the necessity of unified regulation and control of radio, and of having the coastal system under the exclusive supervision of the Navy Department.

The Navy has, well established and in successful operation, a shore radio system capable of reaching ships at sea and establishing communication with all United States territories and foreign countries. Our transocean stations on the Atlantic easily communicate with England, France, Germany, and Italy; by means of the stations on the Pacific coast at Pearl Harbor, Hawaii, Guam, and Cavite, we are in easy and constant communication with the Philippines and Japan; our stations are located at strategic points in our own possessions from the Panama Canal Zone to Alaska.

The Navy actually owns 174 of the 233 radio stations in the United States and its possessions, only five high-power stations being under private ownership. The stations now owned and operated by the Navy include 5 transocean, 140 ship-to-shore, and 24 radio compass stations.

WOULD GIVE GOOD SERVICE AND PRODUCE LARGE REVENUES.

This radio system is of the greatest value to the Navy in time of peace, and absolutely vital to our operations in war. In addition it can be made of the highest usefulness to our merchant marine and commercial interests. It is capable of handling, in addition to naval communications, a considerable amount of other business, marine, commercial, and press dispatches. If this were done, charging only very moderate rates, the system would produce a large revenue and

could be operated at the highest efficiency at a nominal cost to the Government.

DAILY SHIPPING BULLETIN HAS WIDE CIRCULATION.

The Daily Shipping Bulletin, which is issued by the Naval Communication Office, has grown to a circulation of nearly 2,000 copies per day. Of its subscribers some 1,400 are commercial firms, such as shipping companies, marine underwriters, ship brokers, exporters and importers, and press associations. The Bulletin contains the names of 12,500 ships with news of their last movements, and the record of nationality, register, tonnage, and cargo. The popular demand for the Bulletin is growing daily and its success as a Government activity seems to be assured.

CODES, CIPHERS, AND SIGNAL BOOKS.

The Code and Signal Section has been engaged in the compilation of the United States Naval codes, ciphers, signal books, radio, and visual call publications. These have been distributed to all men-of-war, and during hostilities were also circulated to merchant ships. During the last fiscal year 159 United States publications, 332,191 copies, and 378 Allied publications, 156,778 copies, have been received and the majority distributed.

WORLD'S MOST POWERFUL RADIO STATION BUILT IN FRANCE.

Work at the great Lafayette radio station near Bordeaux, France, was temporarily discontinued after the date of the armistice, but arrangements were made later whereby the French Government is to take over this station after its completion by the Navy. Twenty per cent of the actual erection was done at the time of the armistice, and a contract for about \$250,000 was let on March 19, 1919, for the completion of the towers. This work is now going forward at a rapid rate and is practically finished. No installation of similar size is known elsewhere in the world. The steel work consists of eight towers 820 feet high, each taller than any other structure save the Eiffel Tower, and their erection demands the most skilled practice of the structural steel industry. A sending voltage of 140,000 volts is proposed for the antenna system, enabling it to communicate with points in all parts of the world.

SURPLUS STOCKS REDUCED—CONTRACTS CANCELED.

Providing amply for war demands, the supply department of the Navy had accumulated stocks and stimulated production to meet all possible requirements. When hostilities ended the immense influx of

stocks of ship's supplies and all the other articles necessary to maintain the fleet. the shipbuilding and repair yards and the stations and districts at home and abroad had to be stopped, diverted, re-stored, salvaged, sold, or held in condition for reissue.

A survey of all outstanding contracts was immediately made, with the result that 1,495 contracts for supplies were canceled or reduced. Of this number, 934 were canceled without any liability on the part of the Government, the total cancellations amounting to \$26,392,194.95. On 272 contracts for which the contracting companies claimed damages, adjustments were made at a total cost of \$10,780,700.30. the value of the canceled portions aggregating \$46,397,322.98. The sum paid to the contractors represented the value of raw and partly finished material and special tools taken over by the Government, overhead expenses, depreciation in market prices, machinery and buildings taken over or amortized by the Government, and profit allowed on work in process. No profits have been paid on the unperformed portion of any contract.

SALVAGE AND SALES AMOUNT TO \$30,000,000.

The work of salvaging material returned from abroad, from abandoned stations in the United States, from vessels formerly operated by the Navy and the sale of scrap and condemned material to the best advantage was immediately taken in hand. Having in mind the desirability of relinquishing leased storage, segregation and retention of articles and materials suitable for stock, and disposal of materials no longer needed, special boards of survey, appraisal and sale were established in the various naval districts. The total proceeds from sales conducted since the armistice was signed approximate \$30,000,000.

Paralleling the customary Navy procedure in the purchase of supplies, every effort is made, in making sales, to obtain the widest competition by advertising in the public press and by the issuance of schedules of sale to all prospective bidders on extensive mailing lists maintained for the purpose. The sales are made attractive to the smaller dealers by permitting bids on small or partial lots. Excess war stocks of certain articles of textiles, clothing, and provisions were authorized sold to the mechanics and laboring force of the various Navy yards and stations.

OVER \$7,000,000 REALIZED FROM WOOL SOLD AT AUCTION.

The success which attended the Navy's importation of wool from Australia for naval purposes was finally completed by the sale at public auction of the quantities which remained on hand in excess of the requirements. over \$7,000,000 being realized from the two sales held.

SALE OF VESSELS, SMALL YACHTS, AND MOTOR BOATS.

In view of the large number of vessels to be sold, it was found advisable to modify a number of unnecessary restrictions which tended to discourage bidding. The mailing list of interested parties was enlarged to nearly 5,000 concerns interested in this business. The vessels sold, or to be sold, are mostly small yachts and motor boats, and about \$900,000 has been realized from these sales so far. Many vessels listed for sale have not yet been disposed of, but every effort is being made to sell them to the best possible advantage.

ALL BUT 300 NAVY ORDERS HAVE BEEN SETTLED.

Although the Navy's commandeering powers were in no wise vitiated by the cessation of hostilities, the guiding principle followed has been that the department should lend its influence in so far as practicable toward the resumption of normal business conditions; and Navy orders have been issued only as a last resort, in but a few cases, and then only when it appeared that real competition was lacking or that unfair prices were being demanded.

Out of a total of 6,200 Navy orders issued during the war, all have been settled with the exception of 300, these awaiting final price fixing, and in most of these cases the delay has been due to causes beyond our control. It is believed that not more than a dozen cases of price fixing by the Navy will require final adjudication in the Court of Claims.

GREAT REDUCTION IN PURCHASES.

The opening of bids, the making of awards, and the preparation of contracts assumed a normal status with the return to peace conditions. Since November 11, 1918, requisitions have been filled from excess stock left over from war-time purchases whenever possible and a total of 640 advertised schedules, involving supplies to the value of \$58,575,239, have been canceled prior to award.

EXCESS STOCKS UTILIZED, ENFORCING ECONOMY.

In order that the excess stocks of materials available at the various navy yards and stations might be utilized and purchases reduced to a minimum, a system of inactive and excess stock reports has been centralized in the Navy Department, against which all requisitions are checked and substitutions made when necessary. By this clearing-house method there have been shipped between yards materials to the value of \$13,962,976, and requisitions canceled aggregating \$4,802,673. The Navy is in constant touch with other departments of the Government and with the Emergency Fleet Corporation, with a view to utilizing excess stocks.

SURPLUS PROVISIONS AND CLOTHING.

In its plans for demobilization, the Navy had a serious problem confronting it in the disposition of the excess stocks of provisions and clothing. During the late summer and fall of 1918, the estimates of quantities of provisions and clothing were based on an ultimate strength of 750,000 men; whereas demobilization commenced before the enlisted strength increased beyond 550,000 men. Stocks of provisions had been allocated through the Food Purchase Board when the season's crop was being harvested and the armistice, therefore, found the Navy with excess stocks on hand of practically all items of provisions.

Immediate steps were taken to cancel or reduce the contracts for clothing and small stores and as many items as possible of provisions were canceled; others were disposed of to the allied Governments, and others placed on sale at our yards and stations or sold by competition to the highest bidder. The clothing factories at Charleston and New York have been shut down, and efforts are being made to dispose of the excess stocks. All deliveries under the war-time contracts which could not be canceled have been completed.

THE NAVY RATION—ALLOWANCE ON SHIPS STANDARDIZED.

During the war, the rise in the cost of all staple articles of provisions was so great that it became increasingly difficult to establish an equitable ration allowance for destroyers and other vessels not carrying supply officers, the crews of which were subsisted on a money basis, due to the fact that there was no supply officer attached. Recognizing the necessity for increasing the ration allowance to keep pace with the rise in the cost of provisions during the war, this was done several times—first to 50 cents, then to 55 cents, and later on to 60 cents per man per day.

As requests for increases in the allowance continued to be received from individual vessels, a plan for determining what the allowance ought to be, based on the average rise in the provision market, was devised, and this plan has proved an admirable solution of the problem. The first allowance established as a result of this procedure was 66 cents; three months later it was automatically increased to 68 cents. It then became obvious that the percentage of increase (25 per cent) over the average cost of the ration in the battle fleet was too great; and it was accordingly reduced to 20 per cent. As a result of the latest computations, the allowance is now 72 cents, the average cost of the ration in the battle fleet being \$0.5999 for the preceding three months. The average cost of the ration during the year was \$0.5571 per man per day, as compared with \$0.4853 for the previous fiscal year.

FED 1,700,000 TROOPS RETURNING HOME ON TRANSPORTS.

Under the arrangement with the Army, the Navy had charge of the feeding of troops on transports, and the greatly accelerated movement in bringing home the American Expeditionary Force imposed a tremendous task upon the Supply Corps. Large amounts of supplies had to be provided and issued as needed, immense quantities of food cooked and served in limited time and space. The utilization of all space that could be made available for troops and the large numbers carried on vessels complicated the problem. When it is considered that 1,700,000 troops and passengers were fed on returning transports, in addition to their officers and crews; that on a vessel like the *Leviathan* more than 200,000 meals were served on a single voyage, the magnitude of such an accomplishment can be realized. It is estimated that a total of over 60,000,000 meals were served during the year aboard vessels of the Cruiser and Transport Force, to Army personnel, in addition to Navy personnel, crews, and passengers.

Three hundred and eighty-two supply officers were required for this work; and they have most efficiently performed their arduous duties.

NAME CHANGED FROM "PAY CORPS" TO "SUPPLY CORPS."

The naval appropriation act passed last July contains a provision for changing the name of the Pay Corps to Supply Corps. It had long been recognized that the work of the corps had far outgrown the name "pay" and that consequently the retention of this word in its title was not only inappropriate but actually misleading.

FUELING OPERATIONS—AMPLE FACILITIES PROVIDED.

From November 11, 1918, fueling requirements continued toward the peak and demanded special attention on account of heavy troop-return movements. The constantly increasing demands necessitated expedition in construction work, increase of storage space, and bunkering facilities. Stream-fueling barges of modern type, floating storage, additional coal towers, coal elevators, special mechanical coaling devices for bunkering side-port ships, locomotive cranes, and other equipment were acquired, enabling the Navy to keep pace with needs and providing ample facilities to meet the demands at important ports. The shore storage plant at Constable Hook proved equal to the demands expected of it and removed all anxiety and uncertainty in the matter of an adequate supply of coal for the large number of troop and other vessels operating out of New York. The mechanical bunkering equipment installed by the Navy at the

Hoboken piers proved entirely satisfactory for the quick turn around of troop transports and enabled the bunkering of ships at the rate of 8,000 tons in 16 hours, with a total turnover of 60,000 tons per week to vessels' bunkers.

The fuel depots at Newport News and Sewalls Point, Va., were completed, giving the Navy two well-equipped storage plants, with a capacity of 300,000 tons each. These depots are capable of delivering 3,000 tons in 24 hours to vessels at the piers, and coal can be stored at the same rate. Operations at the special bunkering depots—Lamberts Point and Newport News—were carried on with satisfactory results, permitting the issue of 3,000 to 5,000 tons of coal in 24 hours.

3,795,000 TONS COAL, 10,500,000 BARRELS FUEL OIL.

During the last fiscal year about 3,700,000 tons of bituminous and 95,000 tons of anthracite coal were required. The consumption of fuel oil, approximately 10,500,000 barrels, showed a tremendous increase over the previous fiscal year, and the consumption during that year (1918) was treble that of the fiscal year 1917. The total quantity of gasoline used was 13,645,000 gallons as compared with 11,500,000 gallons in 1918; also an increase of about 28,000 barrels of gas oil is noted, in that 68,000 and 40,000 barrels were used during 1919 and 1918, respectively. For aviation purposes, there were furnished 1,750,000 gallons of gasoline.

PLANS FOR DEVELOPING ALASKAN COAL FIELDS.

The Navy commission which recently investigated the Alaskan coal fields has submitted its report, which is being given full consideration in connection with the plans for the future development of those fields. This should, in time, prove a valuable source of supply for the Pacific Fleet and our bases, yards, and stations on the Pacific coast.

FIREPROOF STOREHOUSES FOR FLEET SUPPLIES.

The Navy has developed during the war—and particularly in the past year—some excellent examples of the modern fireproof storehouse. The Naval supply bases at New York and Hampton Roads were designed to carry out the idea of segregating fleet supply from industrial stock, thus relieving the local navy yard of a part of the supply work which had no direct connection with its normal activities. The system has worked out so well that it may be applied to other stations when funds are available for the development of these projects.

SPECIAL EXAMINATIONS MADE TO DETERMINE COMPENSATION.

Up to the end of the fiscal year, 518 special cost examinations had been made in connection with determination of fair compensation on Navy orders, the awarding of fixed price contracts, the approval of price on material orders for ships under construction, general price policies, etc. These examinations involved \$56,900,000, and the price reductions made on the basis of the cost examinations amounted to \$19,300,000. On June 30 there remained 232 special cost examinations to be made, involving \$33,200,000, principally in connection with cancellations of fixed price contracts.

DISBURSING OFFICERS MADE EXCELLENT RECORD.

Advances of funds to disbursing officers during the fiscal year amounted to \$2,047,573,981.33, the peak having been reached in October, 1918, when 418 requisitions were drawn on the Treasury for an aggregate of \$226,000,000.

The money expended by disbursing officers during this period of stress has been satisfactorily accounted for, except in a comparatively few cases, notwithstanding the tremendous volume and pressure of work. Many accounts, however, covering the principal period of activity remain to be examined by the Auditor for the Navy Department.

FOREIGN EXCHANGE—FRENCH CREDITS ADJUSTED.

In March the machinery which had been used to maintain definite rates of sterling, franc, and lire exchange was done away with, and exchange allowed to find its own level. This resulted in a general depreciation and fluctuation which still exists, involving many debits and credits to the appropriation "Pay, miscellaneous," on account of losses and gains on balances. Upon the basis of an understanding arrived at by the Treasury Department, a payment of \$107,000 was made to the French Government in June to adjust prior differences on French credits to Navy disbursing officers between the standard rate of francs and the current rates on dates negotiated; the current rates, although controlled, having been at times slightly higher or lower than the agreed rate.

TOTAL NET APPROPRIATIONS FOR THE WAR, \$3,357,993,878.

The following statement shows the amount of money made available to the Navy for the prosecution of the war:

Available balance, Apr. 1, 1917-----	\$26, 716, 218. 48
Naval act, Mar. 4, 1917-----	516, 607, 387. 08
Deficiency act, Apr. 17, 1917-----	9, 081, 569. 71

Deficiency act, June 15, 1917-----	\$514,805,033.87
Deficiency act, Oct. 6, 1917-----	561,483,059.29
Public No. 62, Oct. 6, 1917-----	150,000.00
Deficiency act, Mar. 28, 1918-----	63,569,809.25
Public No. 140, Apr. 26, 1918-----	1,000,000.00
Deficiency act, June 4, 1918-----	25,907,000.00
Naval act, July 1, 1918-----	1,573,388,360.84
Deficiency act, July 8, 1918-----	8,322,208.24
Public No. 223, Oct. 17, 1918-----	4,550,000.00
Deficiency act, Nov. 4, 1918-----	107,928,043.69
Deficiency act, Feb. 25, 1919-----	276,962,225.36
Allotted by President from appropriation "National security and defense"-----	1,883,408.90
Total amount appropriated-----	3,692,354,324.71
Less amount returned to Treasury by second deficiency act approved Feb. 25, 1919-----	334,360,446.65
Net total-----	3,357,993,878.06

AMOUNTS DISTRIBUTED TO VARIOUS BUREAUS.

The amounts appropriated were distributed to the various bureaus of the Navy Department as follows:

	Amount appropriated.	Amount returned to Treasury by act of Feb. 25, 1919.	Net amount avail- able for expendi- tures.
Office of the Secretary-----	\$1,195,993,614.05	\$98,000,000.00	\$1,097,993,614.05
Bureau of Yards and Docks-----	223,370,706.57	2,713,627.00	220,657,079.57
Bureau of Navigation-----	81,819,937.43	4,500,000.00	77,319,937.43
Bureau of Ordnance-----	825,314,875.87	164,833,843.69	660,481,032.18
Bureau of Construction and Repair-----	117,322,371.87		117,322,371.87
Bureau of Steam Engineering-----	110,011,296.59		110,011,296.59
Bureau of Supplies and Accounts-----	833,783,351.04	23,096,000.00	816,487,351.04
Bureau of Medicine and Surgery-----	38,032,937.09		38,032,937.09
Marine Corps-----	204,186,012.72	41,216,975.96	162,969,036.76
Amount available Apr. 1, 1917-----			26,716,218.48
Total-----	3,665,638,106.23	334,360,446.65	3,357,993,878.06

ACTUAL WAR COST APPROXIMATELY \$2,982,000,000.

The funds made available for the use of the Navy during the period from April 1, 1917, to June 30, 1919, amounted to \$3,357,993,878.06. Assuming that the expenditures for the Navy on a peace basis during this period would have continued to increase at the same rate as during the decade from 1907 to 1916, in which time the annual cost of the Navy grew from \$98,392,144.07 to \$152,821,540.67, the total expenditures for the Navy on a peace basis from April 1, 1917, to June 30, 1919, would have been \$375,598,947.77. Deducting this from the total available amount of \$3,357,993,878.06 shows that the additional amount of money required by the Navy on account of the war was \$2,982,394,930.29.

ESTIMATES REPRESENT ACTUAL NEEDS.

The estimates, by appropriation titles, of the amounts required for the support of the naval establishment and the Navy Department during the fiscal year ending June 30, 1921, will be found as an appendix to this report. I have endeavored to have them represent the irreducible minimum, although that is not easy of accomplishment with an accounting system, originated in 1906, which does not give expenditure figures according to the various objects into which lump-sum appropriations are divided.

A pressing need exists for textual improvement in many of our appropriations, but it would seem unwise materially to disturb the present order and arrangement until all accounting incident to the war shall have been completed. To do otherwise obviously would tend to confusion in the preparation of financial statements and reports of various characters covering the war period, for which a demand very probably will exist for a number of years to come.

\$40,115,584 LESS THAN FOR CURRENT YEAR.

The estimates for the naval establishment amount, in all, to \$573,-131,254.80, or \$40,115,584.08 less than the appropriations for the current fiscal year. Other than for ship construction, the appropriations recommended amount to \$387,883,254.80, or less than two and one-quarter times the appropriations carried for like purposes in the naval appropriation act approved August 29, 1916, despite the growth of the fleet, the shore establishment, and the personnel, to say nothing of advanced labor and material costs.

\$185,248,000 FOR CONTINUING WORK ON VESSELS.

The amount requested for continuing work on vessels heretofore authorized (\$185,248,000) is well in excess of the sum provided for the current fiscal year, but it is no more than necessary if work on the vessels is to proceed without interruption. There should be but one more appropriation necessary to complete the vessels of the 3-year program, authorized in the act of August 29, 1916.

AS TO THE NEW BUILDING PROGRAM.

The estimates contain no recommendation for the appropriation of money or for an authorization to proceed with any new ship construction. A separate estimate will be presented when the department has determined upon its recommendation as to new construction. I have before me the recommendations of the General Board, which are presented as Appendix A, and I will give these careful consideration and be prepared to state my views when the estimates are taken up for consideration by Congress.

REDUCTION IN ESTIMATES FOR DEPARTMENT.

For the Navy Department proper the total amount recommended is \$3,097,870. Included in this sum is \$819,510 for the pay of members of the Naval Reserve Force who were transferred to inactive duty and given employment in civil ratings pursuant to the legislation carried in the naval appropriation act approved July 11, 1919, and \$180,460 for pay of employees in the office of the Director of Naval Communications, heretofore paid from the naval appropriation "Engineering." Eliminating, for comparative purposes, these two amounts, the estimates for 1921 are \$125,110 less than for the current fiscal year. Actually the reduction is much larger, because the total of the annual compensation of those members of the Naval Reserve Force who were transferred to inactive duty and given employment in civil ratings in the Navy Department proper was \$2,835,566.80 at the time of transfer, whereas for 1921 the amount recommended is \$819,510.

PRESSING NEED FOR SALARY RECLASSIFICATION.

In view of the report and recommendations required by law to be submitted to Congress on or before January 12, 1920, by the Joint Commission on Reclassification of Salaries, no increases of pay have been recommended in the estimates for 1921. There is a real and pressing need for a salary reclassification such as contemplated by the act of March 1, 1919, and I earnestly hope that the commission's labors will bring early and satisfactory results. The civilian personnel of the Navy at Washington, in navy yards, and all Navy bases and stations, during the war vied with men in uniform in patriotic service. They received only small increase by Congress. Those whose efficiency and devotion aided so materially deserve just and adequate compensation.

CARED FOR SICK AND WOUNDED ON TRANSPORTS.

Caring for the sick and wounded, guarding the health of United States troops transported from Europe, in addition to the large Navy personnel, imposed heavy duties upon the medical department of the Navy, and its untiring vigilance and energy in meeting these demands deserves the highest praise.

Especial credit is due the medical officers and hospital apprentices assigned to the Cruiser and Transport Force, who, making voyage after voyage in constant attendance on the sick, with even their few hours in port devoted to securing needed supplies and equipment, displayed the most unflagging devotion to duty. They aided Army and Navy authorities in insuring, in the many vessels converted into

troopships, sufficient accommodation for sick and wounded, with provision for treatment according to modern hospital standards, and facilities for maintaining sanitary conditions aboard ship, the detection of contagious diseases and eradication of vermin to prevent the introduction of typhus fever into this country. In caring for the wounded and the sick aboard, the efficiency of the personnel increased with every voyage. The many expressions of appreciation from men of the Army have been very gratifying to the Navy, which was more than pleased to be able to render this service, and the fewness of the complaints testifies to the success with which this duty was performed under trying conditions.

FEWER INFLUENZA CASES ON SHIPS THAN ASHORE.

During the terrible influenza epidemic our medical officers and hospital corpsmen on the transports worked to the point of physical exhaustion, but they were rewarded by the fact that there were fewer cases, in proportion to numbers, on ships than there were on land, and lower mortality than among troops or naval personnel ashore.

Five hundred medical officers were assigned to the Cruiser and Transport Force. With the sick-bays on converted vessels and other transports, the Navy was prepared to handle on troopships 15,000 stretcher cases per month. This was 80 per cent of the total sick-bay accommodation, the remaining 20 per cent being reserved for the casual sick of crews and troops and returning sick and wounded of the Navy.

151,650 SICK AND WOUNDED BROUGHT BACK.

When it is considered that 1,700,000 troops and passengers were brought back on United States transports, that 151,650 sick and wounded were returned to this country, and that, during the period of hostilities, more than 900,000 troops had been carried to France on vessels manned by the Navy, some idea can be gained of our Medical Department's task in connection with troop transportation.

This was in addition to its vastly increased duties in caring for the health of the Navy and Marine Corps personnel, which expanded to ten times the number in service before the war, and was rendered more difficult by the influx of hundreds of thousands of recruits, the large forces serving abroad and the hundreds of added vessels for which medical attendance had to be provided.

In time of war one of the most difficult tasks is to prevent contagion and the spread of disease, liability to which is vastly increased by the gathering of great masses of men in armies and navies. Rigid sanitary measures and constant vigilance are required, and these were early provided for and well carried out. Only one really wide-

spread epidemic occurred in our forces, that of influenza, which swept over the world and affected civilian populations even more seriously than it did armies and navies. But even with the ravages of this disease, which all efforts could not prevent, the deaths from disease in the Navy and Marine Corps were much fewer, in proportion, than in previous wars. With the decline of influenza, conditions rapidly improved, and the showing in health and sanitation during the past year has been gratifying.

MEDICAL SERVICE ABROAD.

With well-equipped hospitals at or near important bases in England, France, and Ireland we were well prepared to care for our personnel. The best possible provisions were made for those on our ships in European service. Our battleships on duty in the North Sea were prepared for any emergency. Battle dressing stations were provided with reserve lighting devices, lockers were stored with surgical dressings, and there was every facility for the handling of wounded. Medical, dental, and nursing staffs were up to the complement and fully trained. Destroyers and smaller craft carried competent hospital corpsmen and more skilled medical assistance was within easy reach.

HOSPITAL CORPSMEN ON CARGO SHIPS.

Every vessel of the hundreds of cargo ships operated by the Naval Overseas Transportation Service carried trained hospital corpsmen. This first-aid and sanitary service was under the supervision of experienced medical officers stationed at New York, Baltimore, and Norfolk, who, with their assistants, visited each incoming or outgoing cargo carrier, saw to its medical equipment, and arranged for dispensary treatment, ambulance, hospital, and laboratory service, where required.

CARING FOR AIR SERVICE IN EUROPE.

In connection with the naval air service in Europe there were on duty in England, Ireland, France, and Italy 72 medical officers, 15 dental officers, and 298 members of the hospital corps. The sick and injured were cared for in buildings of the dispensary type—hutments and tents—or in permanent buildings assigned, loaned, or rented and modified to serve for the reception of the sick. Whenever neighboring hospitals were not available for major cases, local facilities were provided at the air stations.

SERVICE WITH MARINE REGIMENTS IN FRANCE.

Serving with marine regiments in France were 60 medical officers, 12 dental surgeons, and 500 hospital corpsmen. More than 300 cita-

tions, awards, or recommendations for honors were made in favor of these officers and men. Of the total medical department force with the Marines, 109 were wounded or gassed, 13 were killed, and 1 taken prisoner.

The base hospitals abroad were demobilized as soon as the occasion for their services passed. The last to be put out of commission was Base Hospital No. 5 at Brest, which had been the first to begin operations and had connected with it a medical supply depot. That portion of the personnel of these hospitals enrolled for temporary service has been discharged as fast as practicable.

DUTIES INCREASED AFTER THE ARMISTICE.

Instead of decreasing, as in most other branches of the service, the demands on the Medical, Dental, and Hospital Corps increased after the armistice, owing to the larger troop movement. From January 1 to July 30, 1919, 112,131 sick and wounded were returned from abroad by the Cruiser and Transport Force; in July and August the number was 8,538, of which 628 were men of the Navy and Marine Corps. At the height of troop transportation 300,000 men per month were embarked on transports. The health of all these had to be looked after, and, clearly, none of the medical officers in the transport service could be dispensed with. Even with the release of reserves and considerable numbers of the regular Navy, there still remained a large Navy and Marine Corps personnel to be cared for. So, demobilization of the Medical and Hospital Corps was necessarily slower than in any other branch of the service, but this has been accomplished as rapidly as conditions permitted.

REDUCTION IN MEDICAL PERSONNEL.

On July 1, 1919, the medical corps of the Navy consisted of 592 officers of the Reserve Force, 865 of the Permanent Establishment, and 315 holding temporary appointments. This left the corps far below its authorized complement for the existing strength of the Navy and Marine Corps. Medical officers of the Naval Reserve Force to the number of 749 had already been demobilized, as had 116 officers holding temporary commissions who presented urgent reasons for prompt return to civil life.

It was hoped that after the war many of the younger reserve officers and of those serving under temporary commissions would decide to remain in the service, but this has not proved to be the case, and new efforts must be made to induce more qualified physicians to enter the Medical Corps, which should appeal especially to those who have a special love for the sea, for change and travel. It offers the opportunity for service of the highest value not only

on ships and at stations but in the territories under our jurisdiction, such as Samoa, Guam, the Virgin Islands, and the Philippines.

MORE MEDICAL OFFICERS NEEDED.

The proper care of our sick requires that our hospitals shall always be sufficiently manned to permit the clinical, laboratory, X-ray, and surgical work and special treatment to be done by men of appropriate training, and our medical officers must have opportunity for study and special clinical work, and for this ample personnel must be provided.

There is a moral obligation not only to continue but expand the work of elevating and developing the population of our various island possessions or dependences, which rests largely on the medical officers and hospital corpsmen of the Navy. Our nurses are doing a noble work for the people of Haiti, Guam, and Samoa by the training of native nurses. Recently most of the inhabitants of the Virgin Islands have been, by vaccination, rendered temporarily immune to typhoid fever, and this is to be repeated hereafter periodically. These are only a few examples of the work we are doing, and must continue.

DENTAL CORPS HAS PROVED ITS VALUE.

Reports from all ships and stations continue to demonstrate the great value of the work of the dental officer, and many dental surgeons are needed. Before the establishment of this corps, our enlisted men were often exploited by men of inferior ability ashore, to the financial detriment of the men and involving loss of time to the service. Few remedial measures of recent years have given more satisfaction to enlisted men than the establishment of this corps.

REHABILITATION AND VOCATIONAL TRAINING.

Carefully elaborated plans were put into operation at various yards and stations by which the victims of war wounds received, through the cooperation of the local commandant, commanding officers of naval hospitals and a representative of the Federal Board for Vocational Training, splendid opportunities for reeducation and training in government workshops under medical and industrial supervision. Fortunately the number of cases in the Navy and Marine Corps requiring reeducation and training of this character was very small and when, in August, those who had been undergoing it at the request of the Federal Board had completed the course, it was discontinued.

BRINGING HOME THE REMAINS OF OUR DEAD.

Every effort has been made to comply with the wishes of the relatives of those who died at sea or ashore abroad during the war in regard to the disposition of remains. Members of the Hospital Corps received special instruction in embalming and a number of experienced licensed embalmers were enlisted in the Navy and Naval Reserve, so that, except in the case of those dying in France, it has been possible to return, for interment at home, the bodies of our men who died in Europe. There have been 29 burials at sea and upwards of 500 bodies have been embalmed and brought home.

The situation with regard to the 366 Navy and 2,800 Marine Corps dead in France and Belgium is complicated by the laws of those countries, and dependent, to a large extent, upon the ultimate disposition of the far larger number of Army dead. The practicability of exhumation and return of the remains of men who died in France has not been determined, but in the meanwhile all graves abroad have been carefully located, marked, and registered.

NAVAL MEDICAL SCHOOL DOING IMPORTANT WORK.

During the fiscal year the laboratories of the Naval Medical School, at Washington, made 13,000 clinical examinations of blood, sputum, etc., and 7,625 examinations of material sent in from cruising vessels and stations in the campaign to eliminate hookworm. In the chemical department 8,200 analyses, many of them of an intricate nature, have been carried out. The laboratories are of great value in facilitating diagnosis not only for the medical officers on duty in the naval hospital and naval dispensary, at Washington, but also for those stationed elsewhere. Various classes of instruction have been conducted for hospital corpsmen as well as medical officers, and a class for medical officers was begun on September 29 with a membership of 30.

DISTINGUISHED HONORS TO THE SURGEON GENERAL.

Recognition of the excellence of the work of the medical department of the Navy, under the direction of Surgeon General Braisted, has come from medical authorities at home and abroad. At the last session of the American Medical Association, Admiral Braisted was elected its president, the highest honor that can come to an American physician. This was not only a personal tribute to the Surgeon General but a tribute as well to the naval medical force. It is gratifying also to record that he has been made an Honorary Fellow of the Royal College of Surgeons of Scotland, one of the few Americans upon whom this honor has been conferred.

MARINES COMPLETE SPLENDID SERVICE ABROAD.

The marines who served with the Army in France have all returned from Europe, with the exception of a provisional battalion of 26 officers and 700 men. The record they made will remain one of the undying glories of the corps and the country. Upon their detachment from the American Expeditionary Force, the Secretary of War addressed the following letter to the Secretary of the Navy:

WAR DEPARTMENT, *August 12, 1919.*

Hon. JOSEPHUS DANIELS,
Secretary of the Navy.

MY DEAR MR. SECRETARY: In the process of demobilization the Marine Brigade, which by the President's order became a part of the American Expeditionary Force and was thus a part of the forces under the control of the War Department and under the command of Gen. Pershing, has now been returned to this country, detached from the Army, and restored to the control of the Navy Department.

I can not permit this heroic force to terminate its association with the Army without expressing to you, and through you to the officers and men of the Marine Corps, the deep sentiment of the War Department and the Army toward it. The whole history of the brigade in France is one of conspicuous service; when it was finally incorporated into the Second Division of the American Army it had early an opportunity to give a heroic demonstration of the unconquerable tenacity and dauntless courage of American soldiers. From then on in successive, almost continuous, battles the Marine Brigade and the division of which it was a part fought sternly and successfully until victory was obtained for the allied armies. Throughout this long contest the Marines, both by their valor and their tragic losses, heroically sustained, added an imperishable chapter to the history of America's participation in the World War.

On behalf of the Army I congratulate the Navy Department, the major general commanding the marines, those who have been instrumental in the formation and training of this splendid organization, and the officers and men of the organization itself.

Cordially yours,

NEWTON D. BAKER.

FOUGHT UP TO THE HOUR HOSTILITIES ENDED.

As a part of the Second Division, fighting shoulder to shoulder with their comrades of the Army, the Fourth Brigade of marines was in continuous service at the front from May 30, 1918, up to the moment hostilities ended, crossing the Meuse River under fire the morning of November 11, and establishing an important position along the heights of the river's far bank before 11 a. m., the hour at which the armistice went into effect.

Following more than six weeks' occupation of a sector south of Verdun, the marines were sent to the sector northwest of Chateau-Thierry, where, in June, they took part in the historic battles in which Hill 142 and the town of Bouresches were captured and the Belleau Woods cleared of German machine-gun nests, after weeks of

desperate fighting. On July 18, in spite of two sleepless nights and forced marches through rain and mud, the Fourth Brigade of marines, under command of Brig. Gen. Wendell C. Neville, participated in the surprise attack south of Soissons, one of the greatest strategical successes of Marshal Foch, and which marked the beginning of the "drive" which never ended until the retreating Germans sued for peace. During the better part of August the marines occupied the Marbach trench sector near Pont-a-Mousson, opposite the fortifications of Metz.

In the all-American offensive in September, which wiped out the huge salient of St. Mihiel, the marines shared with their fellows of the Army the glories of that brilliant operation.

Following a rest period of not more than seven days, they were again called upon, as part of the famous Second Division, to participate in an operation which has since gone down in history as the Battle of Blanc Mont Ridge.

BLANC MONT THE KEY TO RHEIMS.

Blanc Mont Ridge was the key to Rheims. It had to be taken to relieve that city, under fire for four years, from the German menace. Fought from October 3 to 9, the battle which resulted in its capture proved one of the most powerful and effective of the sledgehammer blows struck by Marshal Foch against the retreating Germans, and compelled the abandonment of the whole Rheims massif and a new German retirement of many kilometers on an extended front.

The general advance of the Allies during September paved the way for the assault on Blanc Mont. All along the line they struck in accordance with Foch's plan. Far to the west on the shores of the English Channel the little Belgian Army started the ball, striking viciously at the enslavers of their country. Eastward the reorganized British Army struck on a front between Cambrai and St. Quentin. The new-fledged American forces wiped out the St. Mihiel salient and struck again with greater vigor in the Argonne Forest, while all along the front from Suippes to the Argonne the French attacked in force.

ATTACKED, TIME AND AGAIN, WITHOUT SUCCESS.

By the end of September, however, the allied advance became slower and slower, the pendulum which had swung back from German gains of the spring and summer wavered and at last seemed to come to rest in what the Germans hoped would prove stable equilibrium to last throughout the winter. From the Channel to the Swiss border the line held, and the Germans worked feverishly

strengthening their defenses and preparing for winter. The allied High Command, however, had no idea of ending the campaign and going into winter quarters at that time. Foch and his staff studied maps and intelligence reports to determine where the next blow might be struck with the greatest promise of success, and the German line in the Champagne, north of the town of Suippes and Souain, was chosen as offering the greatest prospect of success at moderate cost, together with great strategic possibilities. Accordingly, an attack was planned, and the Fourth French Army, under command of Gen. Gouraud, the one-armed hero of Gallipoli, was sent forward to the assault. Two lines of German defenses were penetrated, then the advance was halted, and although five attacks in all were made by the crack shock troops of the French Army, no further progress could be made.

SECOND DIVISION SELECTED TO LEAD THE ATTACK.

Having used up several of his best divisions, and not desiring to deplete further the French reserves, Marshal Foch then decided to employ the Second American Division as the spearhead for this new decisive drive. On September 25 Maj. Gen. John A. Lejeune, of the Marine Corps, than whom America has no abler military leader, commanding the Second Division, reported to Gen. Gouraud at Chalons, and on the 28th and 29th the division arrived in the neighborhood of Suippes, becoming a part of the French reserve. On September 27 Gen. Lejeune was summoned to the headquarters of the Fourth French Army, where Gen. Gouraud and his staff were assembled around a large relief map of the sector in which the attacks had been delivered.

“WE CAN TAKE IT,” LEJEUNE TOLD GOURAUD.

Gen. Gouraud placed his hand upon the range of hills on the map representing Blanc Mont Ridge. Turning to Gen. Lejeune, he said:

“General, this position is the key of all the German defense of this sector, including the whole Rheims Massif. If this ridge can be taken, the Germans will be obliged to retreat along the whole front 30 kilometers to the River Aisne. Do you think your division could effect its capture?”

Gen. Lejeune responded that he felt certain the Second Division could take this German stronghold. Told that he would be ordered to make the attack within a few days, he was directed to prepare a plan for the assault.

HIGH PRAISE FROM COMMANDER OF FRENCH FOURTH ARMY.

How successful this attack proved, and the vital and brilliant results accomplished were set forth in the letter from Gen. Gouraud

to Marshal Foch, in which he recommended the citation of the Second Division:

Because of the brilliant part played by this "grand unit" in the offensive of the Fourth Army, during the autumn of 1918, I propose the Second American Division for a citation in "The Order of the Army" upon the following specific grounds:

The Second Infantry Division, United States, brilliantly commanded by Gen. Lejeune, played a glorious part in the operations of the Fourth Army in the Champagne in October, 1918. On the 3d of October this division drove forward and seized in a single assault the strongly entrenched German positions between Blanc Mont and Medeah Ferme, and again pressing forward to the outskirts of St. Etienne-a-Arnes, it made in the course of the day, an advance of about 6 kilometers.

It captured several thousand prisoners, many cannon and machine guns, and a large quantity of other military material. This attack, combined with that of the French divisions on its left and right, resulted in the evacuation by the enemy of his positions on both sides of the River Suippe and his withdrawal from the Massif de Notre des Champs.

TOOK PART IN ARGONNE-MEUSE OFFENSIVE.

Following a brief period of rest, during which replacements were received and the marine regiments were brought up to battle strength, orders were received detaching the Fourth Brigade from the Second Division and placing it under the orders of the Ninth French Corps, under whose orders the brigade undertook a forced march to Leffincourt, where they expected to enter the line. Orders were suddenly changed, however, and the brigade rejoined the Second Division to participate in the Argonne-Meuse operation. They marched more than a hundred kilometers in four days, with but one day of rest. The weather was bad and the roads ankle deep in mud.

Relieving elements of the Forty-second American Division, just south of Landre-et-St. George, the marines "jumped off," following a terrific barrage, at dawn on the morning of November 1, for their final operation of the Great War, the conclusion of which, after an advance of 40 kilometers, found them firmly established on the heights on the west banks of the Meuse.

DESTROYED LAST STRONGHOLD OF HINDENBURG LINE.

The result of the first day's advance is summed up in the following letter written on November 2 by the commanding general of the Fifth American Army Corps, under whose orders the Second Division was operating, to Gen. Lejeune:

I desire to add to my telephone message the assurance of my deep appreciation and profound admiration for the manner in which the Second Division executed the missions allotted to it on November 1.

The division's brilliant advance of more than 9 kilometers, destroying the last stronghold of the Hindenburg line, capturing the Freya Stellung, and

going more than 9 kilometers against not only the permanent but the relieving forces in their front, may justly be regarded as one of the most remarkable achievements made by any troops in this war. For the first time, perhaps, in our experience the losses inflicted by your division upon the enemy in the offensive greatly exceeded the casualties of the division. The reports indicate, moreover, that in a single day the division has captured more artillery and machine guns than usually falls to the lot of a command during several days of hard fighting. These results must be attributed to the great dash and speed of the troops and to the irresistible force with which they struck and overcame the enemy.

The division has more than justified the distinguished confidence placed in it by the commander in chief when it was selected to take the lead in the advance from which such great results are expected. It is an honor to command such troops and they have richly deserved a place in history and in the affection of their countrymen, which is not exceeded or perhaps paralleled in the life of our Nation.

I desire that you convey these sentiments to the officers and soldiers of the Second Division, and that you assure them of my abiding wishes for their continued success in the campaigns that lie before it.

DROVE GERMANS ACROSS THE RIVER.

During the early hours of November 2 orders were received to continue the attack, and that night the Second Division moved forward, overcoming the resistance of the enemy's advanced lines, and at 6 o'clock the next morning attacked and seized the German defense position on the ridge southeast of Vaux-en-Dieulet. Late in the afternoon another successful attack was made and after nightfall, in a heavy rain, the Americans pressed forward through the forest of Belval and occupied a position on the heights south of Beaumont, 8 kilometers in advance of the divisions on the right and left. During the night of November 4 the division again attacked, occupied the town of Beaumont and Letanne and threw the enemy on its front across the Meuse River.

ENEMY BARRAGE PREVENTED LAYING OF BRIDGES.

Plans were made to effect a crossing of the Meuse with the view of commanding the heights on the east bank of the river. After darkness had set in, November 10, two bridges were to be thrown across the river by the Engineers, one north of Mouzon and the other near Letanne. At the first intimation of a crossing the Germans laid down a violent counter artillery and machine-gun barrage along the entire river front. Their fire immediately blotted out all attempts to throw bridges across the river north of Mouzon, and although continued efforts were made by the Engineers throughout the night, the bridges could not be placed in position. The Letanne force was more fortunate, as the enemy fire did not develop in strength until preparations were nearly completed.

MARINES CROSSED MEUSE UNDER HEAVY FIRE.

In spite of the heavy fire two battalions of the Fifth Regiment of Marines crossed the river by 11.30 p. m. and advanced into the woods, cleaning up machine-gun outposts en route. Here they met with strong resistance, and were forced to wait until daylight in order to continue. By 10 o'clock the morning of November 11 the objective, which was the heights commanding the valley of the Meuse, had been reached; and the marines were "digging in." The armistice went into effect at 11 o'clock.

THE MARCH TO THE RHINE.

The Second Division being selected as a part of the American Army of Occupation, on November 17 the marines began their march to the Rhine, passing through Belgium and Luxemburg. During the march through the recently evacuated towns of France and Belgium the troops were enthusiastically cheered. Each little town was decorated with flags, bunting, and flowers; and committees of townfolk, headed by the mayor, met and welcomed the victorious division. In Luxemburg the enthusiasm was less marked, naturally decreasing as the division neared the border.

CROSSED GERMAN FRONTIER DECEMBER 1, 1918.

The German frontier was crossed on the morning of December 1. During the entire march the Americans followed closely upon the heels of the retiring Germans. The crossing of the Rhine was effected on December 13, and the marine brigade took up its position on the extreme left of the Coblenz bridgehead area.

During the early days of the occupation the Allies were by no means certain that the war was finally over. In the opinion of the commanding generals hostile outbreaks on the part of the Germans were to be expected, and a concerted attack against the armies of occupation was by no means beyond the bounds of possibility. While Germany was in a chaotic condition, the old Imperial Government had been overthrown and many provincial and local governments overturned, the German general staff and the national military organization were still intact; and the German Army was assembled, awaiting orders for demobilization.

KEPT IN HIGH STATE OF PREPAREDNESS.

Accordingly the strictest vigilance and the utmost precautions against surprise were maintained, outpost positions and patrols were established, and a strict guard maintained, which prevented Germans from leaving occupied territory or from entering from the neutral zone.

Drills were held constantly, evolutions practiced, equipment inspected and renewed, and the army of occupation maintained in a state of preparedness for any emergency. It was not until late in April that the German demobilization was complete, and the Army could, to some extent, relax this rigid vigilance. Regimental, brigade, division, and corps maneuvers were held at intervals. A great deal of excellent work was accomplished by the Red Cross, the Knights of Columbus, and the Y. M. C. A. workers in providing entertainment for the troops.

MARINES OPERATED RIVER PATROL ON THE RHINE.

A Rhine River patrol, with a number of boats in operation, was established. This patrol consisted entirely of marines, who manned the boats which plied up and down the river.

UPHELD BEST AMERICAN TRADITIONS.

It was my privilege, in the early part of April, to spend several days with the army of occupation in Germany, and to observe for myself the splendid bearing and efficiency of the celebrated Second Division, commanded by Gen. Lejeune, composed of Marines and men of the Army. Upon a review on the heights of Vallendar, overlooking the junction of the Rhine and Moselle Rivers, they bore themselves honorably as the victorious crusaders and defenders of right. Their record as preservers of order, dispensers of justice, and exemplars of Americanism won them as much reputation as their courage in battle.

Charged with a difficult duty, living in the midst of a conquered people, they upheld the best traditions of American soldiers, and by their self-restraint and quiet efficiency showed that an army of occupation can enforce the decrees of its government without harshness or bitterness. The people about them soon realized that they had the job of carrying out the terms of the armistice—that and nothing more—and that the officers and men bore them no malice and would permit no injustice to the native population. I was proud to be an American when privileged, in the occupied territories, to observe their efficient administration. Soldiers and marines alike refrained from any such acts as have so often in history brought a stain upon a victorious army of occupation.

The latter part of June the marine brigade, as part of the Second Division, concentrated upon the advanced line of the bridgehead area, remaining there until the Germans signed the peace treaty at Versailles. On July 16 entraining began and the division was taken by train to Brest. Sailing from Brest July 26 the division arrived

in New York early in August. During the entire period from July 29, 1918, the Second Division was commanded by Maj. Gen. John A. Lejeune, United States Marine Corps, and the Fourth Marine Brigade by Brig. Gen. Wendell C. Neville, United States Marine Corps.

REVIEWED RECORD OF SECOND DIVISION.

Recounting the record of the Second Division, which was composed of two brigades of infantry, one Army and one of Marines; two machine-gun battalions, one Army and one Marine; three regiments of field artillery, one regiment of engineers, one field battalion; train, sanitary, and other auxiliaries; the commanding general, Third American Army, addressed, on July 2, 1919, the following letter to Gen. Lejeune, commanding the division:

As your magnificent division is about to leave his command, it is with a sense of gratitude for its splendid achievements while in the American Expeditionary Force that the Army commander expresses to you and to your gallant officers and men his appreciation of your services.

After occupying a defensive sector between Verdun and St. Mihiel, you were placed in the line of battle, and met, with stubborn resistance, the onslaughts of the enemy's hordes near Chateau-Thierry. Your action at Belleau Wood and your attack upon the capture of Vaux must ever remain brilliant exploits in our military history.

At Soissons, side by side with a veteran French division, you proved to our Allies the fighting value of the Army of the United States, and at St. Mihiel, in the first great American offensive, your prowess in attack was irresistible.

When, in October, 1918, the allied high command desired to reinforce the French Army by American troops of great offensive worth, by real "shock troops," you were loaned to Gen. Gouraud's Fourth French Army, and delivered your famous assault on Blanc Mont Ridge, releasing from German menace the historic city of Rheims.

In the closing phase of the Meuse-Argonne operations, certainly no troops contributed more to the enemy's destruction than your division. After taking Landres-et-St. Georges, Bayonville-et-Chennery, and the Bois-de-LaFolie, you pierced the Bois-de-Belval, and by skillful night fighting and marching you cleared the enemy from the left bank of the Meuse and forced a crossing of the river.

Your brilliant exploits in battle are paralleled by the splendid example of soldierly bearing and discipline set by your officers and men while a part of the Army of Occupation. That spirit and dash which carried your men through the enemy's defenses still predominated when the Army was recently concentrated, preparatory to a further advance into unoccupied Germany.

Officers and soldiers of the Second Division, your achievements and sacrifices have earned for you and for your fallen comrades the praise and gratitude of our Nation.

MARINES SUSTAINED 11,968 CASUALTIES.

According to General Orders No. 66, Second Division, American Expeditionary Forces, published July 2, 1919, the Fourth Marine

Brigade sustained the following casualties between March 15 and November 11, 1918:

Killed, 55 officers and 1,459 men; died of wounds, 25 officers and 753 men; missing, 161 men; wounded (all classes), 252 officers and 8,277 men; gassed, 24 officers and 962 men; total casualties, 356 officers and 11,612 men.

MANY AWARDED MEDALS AND DISTINCTIONS.

One officer (Lient. Louis Cukela), and four enlisted men (Gunnery Sergt. Charles F. Hoffman, Sergt. Matej Kocak, Corpl. John H. Pruitt, and Pvt. John J. Kelly) were awarded Army medals of honor for various acts of gallantry and heroism above and beyond the call of duty while serving with the American Expeditionary Force in France. In addition to medals of honor, four officers were decorated with the Distinguished Service Medal, 88 officers and 261 men with the Distinguished Service Cross, 226 officers and 1,011 men with the Croix-de-Guerre (French), 15 officers with the Legion of Honor (French), 1 officer and 8 enlisted men with the Medaille Militaire (French), 1 officer with the Ordre de la Couronne (Belgian), 1 enlisted man with the Croix-de-Guerre (Belgian), and 1 officer and 5 men with the Croix-de-Guerre (Italian). All these decorations were for service with the American Expeditionary Force.

PARADED IN NEW YORK AND WASHINGTON.

Upon the return of the Fourth Brigade of Marines to this country in August, 1919, it paraded in New York as a part of the Second Division, and in Washington, the Fourth Brigade alone, as a part of the naval service, was reviewed by the President.

WHAT MARINES DID AT PONTANEZEN.

The largest concentration camp in France was established by the Army at Brest. In the early days when American troops were transported to France other ports were assigned as the ports for American transports, but later many men were diverted to Brest and the old camp built by Napoleon was assigned to the American forces. It answered for a few troops, who stayed a night and were then carried to the front, but as the number increased from thousands to hundreds of thousands in a short time, the task of enlarging the camp in a place where it rained incessantly proved to be one of the biggest jobs in France. Shortly after Gen. (then Col.) Smedley D. Butler, of the Marine Corps, arrived in Brest with his Thirteenth Regiment of Marines, he was placed in command of Camp Pontanezen. During the year beginning September 1, 1918, approximately

1,400,000 soldiers passed through this camp, at first hastening to the front, and after the armistice being routed through Brest for home. Gen. Butler converted a small and hastily improvised muddy camp into a great camp capable of caring for 106,000 soldiers, combatted the daily rains and defied the powers of mud, and made the camp clean, comfortable, sanitary, healthy, where soldiers found the best of food and the best possible surroundings. It was one of the big jobs in France, and Gen. Butler's excellent work won commendation in France and in America. His achievement was alike worthy of his great ability and of Marine Corps training and traditions.

MARINES DEMOBILIZED AFTER EUROPEAN SERVICE.

Although the act of July 1, 1918, temporarily increased the authorized strength of the Marine Corps from 693 officers and 30,000 men to 3,017 officers and 75,500 men, this total authorized strength was never reached, due to the cessation of hostilities on November 11, 1918. The highest strength was reached on December 11, 1918, when there were 1,678 officers, 257 warrant officers, and 65,666 enlisted men in the regular Marine Corps, and 452 officers, 31 warrant officers, and 6,704 enlisted men in the Marine Corps Reserve. Voluntary enlistments in the Marine Corps were resumed on December 4, 1918, and on the same date, enrollments in the Marine Corps Reserve were stopped.

RELEASE OF "DURATION-OF-WAR" MEN AND RESERVES.

With the signing of the armistice, demobilization became of paramount importance, and plans were at once put into effect for the release from service of duration-of-war men and reservists. However, as a wholesale reduction of personnel at that time would have seriously crippled the efficiency of the corps, it was decided to first release members of the Marine Corps Reserve and those men of the regular service who enlisted for the duration of the war, who wished to complete their education, or who had urgent family or business interests demanding immediate and personal attention, and an order to this effect was issued on November 20, 1918; on May 1, 1919, however, due to the demands of the service and the reduction of the enlisted personnel, it became necessary to limit the privilege of discharge to men whose release was necessary for urgent financial dependency reasons. Following the approval of the naval appropriation act on July 11, 1919, which provided sufficient funds to maintain the corps only at an average strength of 27,400, demobilization centers were established, and duration-of-war men were discharged rapidly.

TWO BRIGADES DEMOBILIZED IN TWO DAYS.

In August, 1919, the Fourth and Fifth Brigades of Marines, which had been serving with the Army in France, were returned to the Marine Barracks, Quantico, Va., and the naval operating base, Hampton Roads, Va., respectively, at which places the demobilization of these two organizations was effected. There were discharged or transferred to an inactive status, 6,677 enlisted men of the Fourth Brigade and 6,671 enlisted men of the Fifth Brigade, and this task was accomplished in the remarkably short time of two days. There were also about 200 officers of the two brigades who were either discharged or transferred to an inactive status in the reserve.

OFFICERS OBTAINED BY PROMOTION FROM THE RANKS.

Four hundred and thirty enlisted men were graduated from the second officers' training camp at Quantico, and 172 from the Army candidate school in France. These men were immediately enrolled as second lieutenants (provisional) in class 4, Marine Corps Reserve, and were subsequently appointed temporary second lieutenants in the Marine Corps. From the third officers' training camp at Quantico there were 235 graduates, who were immediately enrolled as second lieutenants (provisional) in class 4, Marine Corps Reserve, and immediately assigned to inactive duty. There were also 48 graduates of the Army candidate school in France who were enrolled as second lieutenants (provisional) in class 4, Marine Corps Reserve, and who were either discharged or placed on inactive duty upon their return to the United States, with the exception of 4 who were transferred to the temporary service.

The advisability of obtaining officers from the ranks was never better demonstrated than during the late war, and I believe that by making all appointments to fill vacancies in the future from the ranks, with the exception of such graduates of the Naval Academy as may be assigned to the Marine Corps, we will obtain the highest and most efficient class of officers.

RECRUITING AND RECRUIT DEPOTS.

Enlistments for the duration of the war were stopped immediately upon the signing of the armistice, and voluntary enlistments were resumed on December 4, 1918. With the cessation of hostilities, the principal incentive for enlisting no longer existed, and with the demands for men in all civil occupations and the high wages paid, the corps has found it difficult to obtain recruits. However, considering all the circumstances, the recruiting service has done remarkably well. During May, 1919, recruits were obtained for "special temporary limited service in France," with the understanding

that they would be discharged upon their return to the United States in the autumn when the purpose for which they enlisted would have been accomplished. These enlistments were discontinued on June 10.

TWO, THREE, OR FOUR YEAR ENLISTMENTS AUTHORIZED.

The naval appropriation act of July 11, 1919, authorized the transfer to the Regular Service of Marine Corps reservists, and also authorized the extension of enlistments of those men who had enlisted for the duration of the war. The results in securing men by such transfers and extensions have been very satisfactory. On September 18, the President authorized, until June 30, 1920, enlistments in the Marine Corps for a period of two, three, or four years, and this will prove a decided help in obtaining recruits.

The two recruit depots of the Marine Corps, at Parris Island, S. C., and Mare Island, Calif., were enlarged to take care of the temporary increase in strength authorized for the war, and were able to meet all demands made upon them.

AVIATORS AID MARINES IN HAITI AND SANTO DOMINGO.

Land and water flying with heavier and lighter-than-air craft at home and abroad is being accomplished by the Aviation Section of the Marine Corps, and marine aviation forces served with credit during the war on the northern sector of the western front and at Naval Base No. 13, in the Azores. Two squadrons are operating in Haiti and Santo Domingo, working in conjunction with the marine brigades in those places in the campaign to break up the bands of outlaws with which the countries have been infested, and have rendered valuable services.

THREE AVIATION FIELDS FOR MARINES.

Flying fields are under construction at Quantico, Va., and Parris Island, S. C., which will form the home stations for the aviation forces operating with the Atlantic coast advanced base and expeditionary forces. The construction of a marine flying field at San Diego, Calif., has been approved to accommodate the aviation forces operating with the Pacific coast advanced base and expeditionary forces.

AUTHORIZED STRENGTH OF CORPS, 27,400 MEN.

The naval appropriation bill, approved July 11, 1919, provided for an authorized enlisted strength of the Marine Corps, for the next fiscal year, of 27,400 men, plus such number of men as may be temporarily serving with the American Expeditionary Force abroad.

The demobilization of the two brigades which returned from France in August, and the discharge of duration-of-war men and reservists has reduced the strength of the corps so that the average strength for the year will not exceed the 27,400 authorized.

The bill also provided for the placing on inactive duty within 30 days of all female members of the Marine Corps Reserve, but also provided for the retention of such as were necessary and whose services were satisfactory, in the capacity of temporary civil appointments; and about 75 per cent were retained under this arrangement.

In accordance with my previous recommendations, I again recommend that for the next fiscal year the permanent authorized enlisted strength of the Marine Corps be 20 per cent of the present permanent authorized strength of the Navy plus the necessary allowance for aviation purposes. This would make a total enlisted strength of 27,467.

Special grades for enlisted men performing the duties of aviation mechanics are needed for the Marine Corps. Both the Army and the Navy now have these grades, and qualified men will not enlist in the Marine Corps for these duties when they can get higher pay for the same work in the Army and Navy.

In order to place the Marine Corps on a footing with the Navy, and to accelerate recruiting, it is recommended that the term of enlistment in the Marine Corps be the same as that provided for the Navy. This has been partly accomplished temporarily under an Executive order, but it is desired that the change be made permanent.

100 OFFICERS NEEDED FOR MARINE AVIATION.

To carry out the aviation program assigned the Marine Corps, 100 officers will be required. Forty of these will be automatically obtained by an increase of 1,000 men, and 60 additional officers are specifically asked for in the proposed legislation, as they can not be taken from the regular authorized strength without loss of efficiency.

If the permanent enlisted strength of the corps is increased as recommended, all of the present temporary officers who are eligible for transfer to the permanent commissioned personnel should be given an opportunity to qualify for such transfer.

SHOULD ESTABLISH GRADE OF CHIEF WARRANT OFFICER.

Twenty-five additional marine gunners and 25 additional quartermaster clerks are recommended, and it is also recommended that the grade of chief warrant officer be established in order that warrant officers of the Marine Corps may be on a parity with officers of the same grade in the Navy.

IN CUBA, HAITI, AND SANTO DOMINGO.

Expeditionary forces have been maintained, as in previous years, in Cuba, Haiti, and Santo Domingo. While there have been some outbreaks of bandits, the gendarmerie in Haiti and the constabulary in Santo Domingo, which are officered by members of the Navy and Marine Corps, have proven of the utmost value in maintaining peace and order.

ON DUTY IN ISLANDS AND ON SHIPS.

The regular Marine Corps posts have been maintained in the Virgin Islands; at Managua, Nicaragua; Cavite and Olongapo, P. I.; Peking, China; Guam, and Honolulu, as have also the marine detachments on board the larger ships of the Navy. All demands made upon the corps by the naval service have been met, and such duties satisfactorily performed.

WILL TRANSFER ADVANCED BASE FORCE TO QUANTICO.

The advanced base force was held available for service with the Navy during the past year. Since the signing of the armistice and the consequent demobilization of the war strength of the corps the personnel has been greatly reduced, but this will be remedied and the force reorganized as the men become available. The fixed defense part of this force, which has been stationed at Philadelphia, will be transferred to Quantico, Va., as soon as proper facilities are available at that station.

NEW RECORDS MADE IN MARKSMANSHIP.

Target practice was given special attention during the past year, and excellent results obtained, there being an extremely high number of qualifications in the grades of expert rifleman and sharpshooter. The Marine Corps rifle team squad was entered in the national matches, the National Rifle Association matches, and the Sea Girt tournament, and established a new record by winning 27 of the 34 matches in which they fired. Among the events won were the President's match, the national individual match, the united service match, the national team match, and the Sea Girt championship match.

DEPOT OF SUPPLIES, PHILADELPHIA.

Additional storage space at the supply depot, Philadelphia, is desired. There is sufficient ground, owned by the Government, adjoining the present building to accommodate a 10-story structure. During the war the depot outfitted and equipped 26 expeditionary units

for service in France and the West Indies. Nowhere in the Army or Navy was there superior efficiency shown than by Col. Cyrus Radford, in charge of this depot.

PARRIS ISLAND AND QUANTICO TRAINING STATIONS.

In accordance with the authority contained in the naval appropriation act of July 1, 1918, the Government on September 19, 1918, took possession of the balance of the land at Parris Island, and arrangements are being made for payment for the various properties involved. Additional barracks accommodations for about 4,100 men, messing facilities for 5,600, latrines and bathing facilities for 8,000 men, and quarters for 56 officers, besides larger storage facilities, dredging water approaches, extending sewer, light and power systems, new roads and walks and improvements along the water front, have been completed, and various other improvements are being made.

At Quantico the land we were authorized to buy has been acquired, and additional housing facilities begun have been completed, new water system installed, and we are making numerous other improvements.

BUILDING NEW BASE AT SAN DIEGO.

The preliminary work of dredging and filling in the land for the Marine Corps base at San Diego, Calif., is under way and is nearing completion. Six barracks buildings are in course of construction, and plans and specifications are being prepared for storehouses, power plant, laundry, etc.

FEWER COURTS-MARTIAL—MORE OFFENDERS RESTORED.

In the administration of its judicial system the Navy has sought to maintain discipline by the certainty and promptness of punishment with mercy, rather than the imposition of severe penalties. In instances which required imprisonment it has been enforced, except in the most serious cases, as a corrective, with the purpose of rehabilitating the offender by putting him on probation at as early a period as would justify a reasonable hope of success. The large majority of offenses are not criminal in their nature, but rather due to thoughtlessness and the failure to realize the importance of military obligations.

Never losing sight of the necessity of enforcing upon offenders penalties sufficient to preserve discipline, the Navy has sought to temper justice with judgment, not to resort to court-martial proceedings except in serious cases, and to avoid long and unprofitable sentences. Service on probation has been substituted for confinement whenever it was to be reasonably expected that benefit to the offender and the

service would result, and this has proved successful in a very large proportion of the cases. This was especially true in regard to men temporarily in the service who violated laws or regulations. It was realized that it would not be just to punish them with the same severity as might be applied to men of longer training thoroughly familiar with the necessary restrictions and regulations of military life, yet they had to be dealt with rigorously enough to maintain discipline. Demobilization, with the consequent release of so many men from service, increased the difficulty of this problem, and that it has been dealt with so successfully evidences the wisdom of the policies adopted.

FEWER TRIALS PROPORTIONATELY IN WAR THAN IN PEACE TIME.

It is a striking fact that instead of increasing in the war period the percentage of trials showed a decided decrease from that in time of peace. Not only was this true in regard to courts-martial, but also in regard to minor courts and punishments in general. In the fiscal year 1916 the percentage of men in the service tried by courts-martial was 2.35; in 1917, 1.75; in 1918, 1.17; in 1919, 1.24. By summary courts-martial, 1916, 15.72 per cent; 1917, 9.83; 1918, 3.84; 1919, 5.36. By deck court, 1916, 8.68; 1917, 4.93; 1918, 2.81; 1919, 4.01. In spite of the increased size of the Navy in the fiscal year ending June 30, 1919, when the average number of men under naval jurisdiction was 447,199, the number committed to prison was much less than during the preceding year, the percentage being reduced from 1.07 to 0.7, and the number of men in prison at the end of the fiscal year was 900 less than on June 30, 1918, though the average number of men in service had increased 35,000. During the year 897 men were restored to duty from naval prisons and 489 convicted by courts-martial were placed on probation for one year, sentence of confinement being held in abeyance.

RELIEF FOR MEN WHOSE TRIALS WERE DELAYED.

Delay in the disposition of some cases was unavoidable, especially in the period of demobilization, owing to the time required to trace service records and pay accounts, ascertain and prefer charges and specifications and issue instructions; but where this occurred steps were taken to remedy any injustice. On August 1, 1919, an order was issued providing for the restoration to duty of men who had been held for 60 days or more in confinement, or under restriction pending disciplinary action at navy yards, naval stations, and receiving ships, except those serving sentence of a court-martial, or convicted awaiting promulgation of the action in their cases; those

charged with offenses involving crime or moral turpitude, aggravated military offenses or graft. Under this order a number of men charged with minor offenses were restored to service, it being considered that the confinement they had undergone was sufficient punishment.

A JUDGE ADVOCATE CORPS SUGGESTED.

The Judge Advocate General has recommended, in his annual report, legislation establishing a judge advocate corps as an integral part of the Navy, and that provision be made for a law member to sit with each general court-martial, his decision upon questions of law arising in the conduct of the hearing to be binding upon the court, but he to have no voice in determining matters of fact which are at issue. The department has in a number of cases recently granted to accused persons a new trial when vital errors of law have transpired in the conduct of the hearing. Such errors, rare as they may be, tend to create a doubt as to the justice of the verdict. The retrial of cases is obviously expensive and productive of delay, which might be avoided if the courts had available men trained in the law. It is this which the creation of a distinct judge advocate corps would provide.

NAVAL PRISON—1,500 MEN RESTORED TO DUTY.

While 2,666 men were sent to the naval prison at Portsmouth, N. H., during the past fiscal year, on July 1, 1919, there were only 1,367 in the prison, as compared with 2,331 on the same date a year before. Two thousand men had been discharged after serving sentence, and 1,563, who, by good conduct, gave promise of restoration, were restored to duty. Of the 5,000 who were in the prison, at one time or another, during the year, only five escaped, and two of these returned later; and there were but 28 deaths. This gives some indication of the success of the policy which seeks to give men who have been convicted of offenses every opportunity for restoration.

SOME LAPSES INEVITABLE, BUT MANY "MAKE GOOD."

Individual lapses of conduct in prison, and failures among those restored to the service do occur, in spite of all efforts; but this is not a valid argument against the welfare league system, put in operation by Commander Thomas Mott Osborne, commandant of the prison. The prison does not deal with the best men in the Navy, but with the delinquent. Any salvage is an asset to the service, and there is no question that many of those restored have "made good."

Some have argued that restoring prisoners to the service might lower its morale, through the association of these men with their shipmates and loss of the fear which the severity of the old system

inspired. But fear has never proved effective in increasing efficiency and good conduct, and this is particularly true of the Navy. A man who has to be frightened into good conduct can never be of great value to the service. The effectiveness of any disciplinary institution depends much more upon the curtailment of liberty and the disgrace attendant upon it than it does upon severity. The effect upon his shipmates of a restored prisoner "going straight" and "making good" far outweighs the bad results that may result from failures.

COULD NOT HAVE BEEN HANDLED UNDER OLD SYSTEM.

The improvement in administration of the naval prison can not be appreciated without taking into account the many difficulties and complications arising from its fluctuating population as well as the much larger numbers received. It is not easy to conduct a prison with a stable population of 1,400, but when this fluctuates between 1,300 and 2,500, the total movement reaching 5,000 yearly, the difficulties are multiplied.

It would not have been possible to handle the problem satisfactorily under the old system. Three thousand guards, it was estimated; would have been required for patrol duty. Actually not more than 150 men have been employed for all purposes of guarding, including the work details in the navy yard. The prison was built, originally, to hold only 320 prisoners. To meet war requirements, a number of barracks were built in the immediate neighborhood. Under the old system it would have been necessary to surround these with high walls and extensive wire fortifications well guarded, in addition to the bolts and bars necessary for the prison buildings themselves. As a matter of fact, only a light wire fence has been necessary around a part of the inclosure, and no bars or gratings were placed in the buildings. The opportunities for escape were, of course, greatly increased, but notwithstanding this, only a very small proportion of the prisoners made any attempt to break out. But five remained away, and of these two returned, so that during the entire year the actual loss by escape has been three men.

FINE RESULTS OF SELF-GOVERNMENT PLAN.

There were during the year no riots, excellent conditions of discipline, and a minimum of punishments. These results have been obtained through the participation of the prisoners themselves in the discipline and government of the institution. It has been found wise to have the work gangs of prisoners directed by leaders appointed from among the prisoners, and the interior discipline of the

prison is entirely handled by officials selected by the prisoners' system of self-government known as the Mutual Welfare League. In this organization of their own, the prisoners take a pride, and toward it they manifest notable loyalty. The credit, therefore, for the excellent record in labor and good conduct while in confinement belongs largely to the prisoners themselves, who have shown that when faith is placed in them and opportunity given them to show whether this trust is deserved, they have risen finely to their opportunities.

PARDON FOR YOUNG OFFENDERS.

Under present laws conviction of desertion carries with it permanent penalties, the Attorney General having rendered an opinion that no man so convicted can reenlist or be reinstated in the naval service, even after pardon by the President. In some cases of desertion, especially by boys who do not realize fully the seriousness of their act, there are mitigating circumstances which deserve consideration. I have recommended a change in the law giving the President power, in his discretion, to grant a pardon to these offenders, allowing their reinstatement, with the provision that they shall serve such part of their enlistment as may have been lost on account of confinement under sentence imposed by court-martial.

SOCIAL HYGIENE BOARD DOING AN IMPORTANT WORK.

The Interdepartmental Social Hygiene Board, of which I have the honor of being chairman, has been in existence since July, 1918. Constituted by Congress, the membership of this board is made up of the Secretary of the Treasury, who is represented by Assistant Secretary of the Treasury J. H. Moyle; the Secretary of War; the Secretary of the Navy; Col. P. M. Ashburn, designated by the Secretary of War to succeed Lieut. Col. W. F. Snow, who resigned in September; Lieut. Commander J. R. Phelps, Medical Corps, United States Navy, designated by the Secretary of the Navy; and Asst. Surg. Gen. C. C. Pierce, United States Public Health Service, designated by the Secretary of the Treasury. The executive secretary is Dr. T. A. Storey, professor of hygiene, College of the City of New York. The work of the board has, unfortunately, been delayed because of the unavailability of the original administrative appropriation. This was made available through congressional amendment last July, and the organization is now being developed as rapidly as the Federal civil service machinery will permit.

THIRTY-ONE EDUCATIONAL INSTITUTIONS AIDED.

In spite of these unavoidable delays the board has accomplished some very important results the past year in its program for the

control of venereal diseases. Appropriations from its educational research and development fund have made possible the establishment or enlargement of departments of hygiene in 11 normal schools, 3 teachers' colleges, 3 colleges, and 14 universities. Among these 31 normal schools, colleges, and universities there are 3 institutions for the education of colored people. The institutions aided are located in 24 States. The curriculum of these departments of hygiene includes courses, conferences, and training in hygiene and its application, emphasizing the serious importance of venereal diseases, their causes, carriers, and prevention, as well as the other important facts and applications of general, individual, group, and intergroup hygiene.

The scientific research fund of the board has furnished appropriations to 15 scientific laboratories for the discovery of better medical methods in the treatment and prevention of venereal diseases. Twenty-eight researches are now being undertaken, carried out under the direction and by the expert service of 34 capable scientific investigators.

410 CLINICS ESTABLISHED IN 46 STATES.

Forty-six States have received allotments for assisting their departments of health in the prevention, treatment, and control of venereal diseases, under regulations promulgated by the Secretary of the Treasury through the United States Public Health Service. As a result 410 venereal-disease clinics have been established in the United States, thousands of individuals have been treated therein, and an extensive campaign has been carried on for the distribution of information relative to the hygiene of venereal diseases.

"RED-LIGHT" DISTRICTS KEPT CLOSED.

The civilian quarantine and isolation fund furnished support for the law-enforcement division of the Army and Navy Commissions on Training Camp Activities in its work relating to women from December, 1918, until March, 1919. On April 1 practically all of these law-enforcement activities of the Commission on Training Camps were transferred to the Social Hygiene Board. This field service of the board has given powerful assistance to State and other agencies, which have kept closed some 124 "red-light" districts that were closed up originally by the law-enforcement division of the Training Camp Commissions. During April, May, and June more than 6,000 delinquent women and girls were either sent home, placed on parole, or committed to some institution for treatment and care. This fund furnished also financial support for

assistance in the maintenance of venereally infected persons in 21 reformatories, detention homes, and hospitals who otherwise would have been a menace to the military and naval forces.

BOARD'S PROGRAM FOR THE COMING YEAR.

The program of the board for the coming year is actively concerned with (1) establishing departments of hygiene in normal schools, colleges, and universities, and establishing divisions of educational hygiene in State departments of education for the purpose of securing an appropriate and effective emphasis upon the hygiene of venereal diseases, their causes, carriers, injuries, and preventions; (2) furnishing resources for selected psychological and sociological researches for the discovery of better educational methods in the prevention of venereal diseases; (3) supporting selected scientific investigations for the discovery of better medical methods of prevention and treatment of venereal diseases; (4) assisting State departments of health in the organization of bureaus of protective social measures which shall be concerned with (a) "investigations of social conditions which make for the spread of venereal diseases and a search for foci of infection with a view to securing a proper care or detention of civilian persons infected with venereal diseases; (b) investigation of social influences that produce carriers of venereal diseases, and the follow-up work with persons who have been carriers, to prevent them from again subjecting themselves to conditions which may lead to infection; (c) investigation of prevention and facilities for the care and the maintenance of persons infected with venereal diseases;" (5) the allotment of funds to State departments of health for the continuation of the program laid out by the Secretary of the Treasury for the prevention, treatment, and control of venereal diseases, as directed by Congress.

NATIONAL RIFLE MATCHES HELD ON NAVY RANGE.

In recognition of the valuable service rendered in small-arms training, the National Board for the Promotion of Rifle Practice recommended that the national matches, heretofore conducted annually by the War Department, be conducted this year by the Navy Department on one of its own ranges, exemplifying its development in rifle-range construction and operation.

The national matches 1919 were held at the Navy range near Caldwell, N. J., the largest small-arms range in America, having 250 rifle targets and the additional advantage of being located within accessible distance of about 10,000,000 people. At the conclusion of the national matches the Navy transferred the improvements to the War Department and hopes to see this range become a center for the de-

velopment of rifle practice rivaling in importance the famous British range at Bisley, England.

ARMY FURNISHED BIG WAR EXHIBITION.

One of the pleasing features of the matches was the fine spirit of cooperation of Army and Navy. The War Department spared no effort to contribute to the success of the event, detailing for duty officers of special ability and furnishing ample motor transport facilities, a quantity of material salvaged from near-by Army stations, and ordnance supplies.

The War Department gathered at the matches the largest collection of war material yet assembled for exhibition; furnished a detachment from the Infantry School of Arms at Camp Benning, Ga., to demonstrate the most modern developments of all types of weapons used by infantry, and an aviation detachment, which gave demonstrations of the work of aviation forces in war. These special features attracted many thousands of interested visitors, and made this year's national matches the most successful ever held.

OPERATED BY NAVY AND MARINE VOLUNTEERS.

The force required to operate the range and serve the 5,000 visiting riflemen was composed of men of the Navy and Marine Corps who volunteered to remain in service beyond the time when many of them might have obtained their release. In spite of the breaking of a reservoir dam, inundating the whole region and undoing much of the arduous work of preparation, officers and men redoubled their efforts and accomplished their task in a most commendable spirit. Lieut. Col. William C. Harlee, United States Marine Corps, was the executive officer and had general charge of the arrangements, and to him is due a large measure of credit for the success of the national matches.

INTERNATIONAL MATCH WON BY AMERICANS.

A record number of entries were made in the individual matches, including the classic events of the National Rifle Association, which were held in conjunction with the national matches. The events included not only matches with the military rifle, but also daily pistol, small-bore and trap-shooting events, among them the notable international small-bore team match which was fired simultaneously in America and in England and was won by the American team at the national matches.

72 TEAMS IN NATIONAL TEAM MATCH.

More teams than have ever before competed in a national team match were entered. The 72 teams included the team from the Ameri-

can Expeditionary Force, the victor of the interallied team matches in France; four teams, the Infantry, the Cavalry, the Coast Artillery Corps, and the Philippine Scouts, from the Army; a team from the Navy at large, teams from the Great Lakes and Hampton Roads Naval Training Stations, a Marine Corps team, 15 National Guard teams, 8 college and reserve officer training camp teams, and 39 civilian State teams, including one from Porto Rico.

MARINES WON; A. E. F. CHAMPIONS SECOND.

After a warmly contested match, the match was won by the team from the United States Marine Corps, with the splendid team from the American Expeditionary Force as its closest competitor. The A. E. F. team was selected from the interallied matches by a tryout in France, in which all the regiments of the American Army were represented and among its 12 principals were 5 officers and men of the Marine Corps. The Marine Corps team, by a series of competitions beginning at practically every station of the corps and culminating in a final tryout, reflected their thorough training in rifle practice.

SMALL-ARMS PRACTICE—EIGHT RANGES RETAINED.

Seventeen small-arms ranges were being operated to full capacity by the Navy when the armistice went into effect. With an operating force of about 5,000, they were giving each month training in the operation, use and care of rifles and machine guns to more than 30,000 men of the Navy, Marine Corps, Army, and State Guards. These ranges were also open to all citizens capable of bearing arms, and were utilized by large numbers of civilians subject to call for military service.

Nine ranges—six of large and three of small capacity—have been closed, leaving eight ranges maintained under Navy control, these being at Wakefield, Mass.; Navy Yard, Philadelphia; Naval Academy, Annapolis; Virginia Beach; Great Lakes Training Station; Mare Island Navy Yard, Guantanamo, Cuba; and Olongapo, P. I.

General Board—Study of War and Peace Problems.

During the period of hostilities many important questions of naval policy were referred to the General Board, which also initiated suggestions and recommendations for the prosecution of the war; and since the armistice the board has made a comprehensive study of naval problems and recommended plans for the readjustment of the Navy on a peace-time basis.

Many of the questions proposed have required consideration of the latest and most approved practice upon methods abroad, as well as at home. To secure the best information possible, officers of our

Navy and Army and of foreign services and civilians having special knowledge and experience of the subjects under consideration were called for hearings. The stenographic report of these statements and proceedings furnishes a valuable documentary record. There were no fewer than 82 of these hearings, embracing a wide range of subjects.

The board considered and reported upon various problems, including aviation improvements in battleships, destroyers, and submarines, mine layers and mining operations, stabilizers for battleships and battle cruisers, submarine and aviation bases, fuel storage, armament of naval auxiliaries, and general naval conditions and policies.

CHANGES IN CAPITAL SHIPS CONSIDERED.

After the signing of the armistice the study of possible changes in the capital ships authorized was taken up. There was a feeling upon the part of some of the ablest naval officers that a new type of ship, a composite of the merits of the battle cruiser and the dreadnaught, might wisely be substituted for the two types. One of the objects of the visit of the Secretary of the Navy, Admiral Griffin, Admiral Taylor, and Admiral Earle to the allied nations of Europe was to confer with their naval experts as to the lessons the war had taught in the design and construction of capital ships.

Upon their return the result of their observations and conferences were made available to the General Board. That body, after giving hearings to officers of different views, arrived at a conclusion as to the military characteristics of the new capital ships which met the approval of the whole Navy, and it is upon plans approved by the General Board that these ships are being constructed.

It is believed that the recommendation of this body of naval statesmen, concurred in by the heads of the technical bureaus, will give to our Navy the mightiest fighting ships afloat, embodying the best features of ships abroad as well as at home.

Their annual report, embracing recommendations for a new building program, is printed as Appendix A of this report.

The Naval Consulting Board.

When our country entered the war and the Council of National Defense undertook its gigantic task, it found the Naval Consulting Board a working and efficient organization and formally requested it to become the War Inventions Board. Its head, the distinguished Thomas A. Edison, gave virtually all his time to that board and to naval study and experiment. He lived much of the time on a ship, worked in close harmony with naval officers, gave valuable assistance in the fight against the submarine menace, and aided in other

war measures. Under the direction of Mr. W. L. Saunders, active chairman, the members were assigned to special committees and too much commendation can not be given to their devotion and contributions along many lines of war efficiency.

UNDERTOOK EXPERIMENTAL WORK.

Beginning with the industrial inventory that stirred the country to a state of preparedness, and enlisted in this service a large number of technical men, the interest of scientists was thoroughly aroused by a special meeting in New York on March 3, 1917, at which there were present nearly all of the members of the board, representative naval officers, including Admiral Sims, and 35 well-known scientists representing principally the subjects of electricity, sound, and light. This was the first large gathering of highly trained technical men and naval officials held under the cognizance of the department. As a result of the meeting, considerable experimental work was undertaken particularly on the subject of submarine warfare, and several very interesting and instructive papers have been written and released for publication.

ANTISUBMARINE DEVICES—SHIP PROTECTION.

In June, 1917, the department found it advisable to place all activities on antisubmarine work under the direction of a special board with the commanding officer of the submarine flotilla as senior officer, and a member of the Naval Consulting Board was selected as advisory member of this board.

The ship protection committee of the Emergency Fleet Corporation, formed upon the initiative of Chairman Saunders, did work of special value to the merchant marine. Indeed, no subject received more study nor greater consideration from a large number of experienced authorities than that of protection of merchant vessels from submarine attack.

The New York office, under the management of the board's secretary, accomplished an immense amount of work in sifting ideas and granting interviews with those who submitted inventions or suggestions, and in this was ably assisted by the Chicago branch and the office in San Francisco.

One of the most important subjects investigated was that of the aerial torpedo and, while this device was not fully perfected, the difficulties are now understood, and we are nearer a solution of the problem.

Possessing several members who are authorities in the science of aeronautics, opinions of the board on many ideas submitted were of special value. Considerable research was undertaken in fuels and

their handling, particularly with the reduction of smoke and lessening the visibility of vessels at sea, and through the work of the board the rate of insurance was reduced on vessels complying with instructions worked out.

A complete and illuminating history of the Naval Consulting Board since its organization in 1915 is being prepared under the direction of a committee of the board. It will deal particularly with the activities and useful and patriotic service of the members of the board during the World War and its preparation activities before the war, and will be one of the most valued stories of scientific war work.

Council of National Defense.

The Council of National Defense gave full proof of its value to the Republic in time of war. But it is not entirely a war organization. Before the war it had secured inventories and obtained information that were of great service when active measures were undertaken to supply the Army and Navy. It is taking up the work of preparation and investigation, and will be the repository of information and the clearing house for all agencies that will be ready to be helpful in war. Working members from the six departments of the Government represented in the Council of National Defense are as busy to-day as in war, to keep track of industries and facilities which the Republic will need in any emergency.

The Compensation Board.

It was impossible during the war to obtain fixed-price contracts for the building or repair of ships, big ordnance material, and other munitions and extensions of naval equipment and naval plant. It was, therefore, necessary to make contracts for a fixed fee, leaving it to the Navy to pay the costs as ascertained. These so-called "Navy orders" saved millions of dollars, but required a large number of inspectors, skilled accountants, and clerks to check up every item of expense. The Compensation Board, headed by Rear Admiral Capps, has done a stupendous work in a way that would win the approval of all taxpayers if they could know the diligence and vigilance of the board. This work will continue until all contracts are completed.

Board of Inspection and Survey.

The taking over of ships in the early days of the war, the strenuous duties required of them during and since the war, the completion of new ships, and the survey and sale of many vessels this year, have imposed arduous and important duties upon the Board of Inspection and Survey, headed by Rear Admiral G. W. Kline. Indeed, it may be said that no officers have been given heavier or more difficult

duties, and they have performed them in a manner worthy of high commendation.

The Virgin Islands.

Since the Virgin Islands came under the control of the Navy, it has been the policy of the department to learn the needs of the people, aid in sound development, and give assistance and direction in necessary improvements. The annual deficits of \$225,000 have been met by appropriations by Congress, and this money has been administered in sanitation, health, education, public safety, preservation of law and order, public improvement, agricultural development, and relief of the poor.

Navy doctors, Navy nurses, and hospital corpsmen, aided by the American Red Cross, have waged a war against disease. A dearth of hospitals, surgical instruments, and laboratory appliances at first impeded the work, but these are being obtained. A training school for native nurses has been established in every municipal hospital. Modern surgery has been introduced, there has been a general decrease in the mortality of the islands, and, in general, the health of the population has improved under naval government. It was early seen that sanitation, preventive medicine, surgical hospitals, must be the first steps taken, and, with better sanitary conditions, betterment along all lines, educational and economical, has been advanced. Vigorous efforts are being made to stamp out venereal diseases, which are prevalent. Malaria is endemic and naval medical men are combating it.

There have been few breaches of the peace, and these have been met with firmness by the marines. Reports of race riots and disorder have been greatly exaggerated. The governor of the islands and all in authority have inculcated American principles of government, and are animated by the single purpose to give to the inhabitants of these islands the leadership and aid that will be most helpful to them.

Haiti and Santo Domingo.

Under the naval administration of Haiti the marine forces have assisted the Haitian gendarmerie in maintaining the established government and preserving order and suppressing banditry and robbery by the criminal and disaffected elements. Conditions have improved and the bandits are being dissipated or have surrendered. The education and health of the people have been improved, and the enforcement of law has been followed by prosperous days to the industrious residents.

Under American direction the financial condition of Santo Domingo shows steady improvement. When the military government was instituted in November, 1917, there was but \$35,000 in the treas-

ury, whereas on June 30, 1919, there was a balance of \$3,875,183.13. The school system has been reorganized and its capacity increased fivefold; the penal proceedings have been modified with the resulting acceleration of the progress of the administration of justice; the prison system has been improved; a new concrete wharf and customhouse and important port developments have been made; a national trunk line highway across the island has been surveyed, and is 30 per cent completed, and other important highways are under construction; improvements in agriculture have been made, the agricultural experiment station buildings completed, and the foundations laid for an agricultural college; the railroad service in the north of the island has been greatly improved; and a clean administration solely in the interest of the people has been the constant and successful aim of those to whom this trust has been committed.

Called to restore order and administer the finances of these governments close to us in geography and in interest, it is gratifying to report that there has been freedom from all suggestion of selfish aims on the part of the occupying civilian and military agencies. The development of the country, the education and welfare of the people, improvement in agriculture, the firm and kind administration of justice have born their fruit in the most prosperous era in the history of these neighbor governments.

Samoa and Guam.

These two islands came under Navy control after the Spanish-American War, and the Navy Department administers them through naval officers who have the title and authority of governors. Under such government the one care is the welfare and development of the people.

The terrible epidemic of influenza, which swept the South Pacific as well as other parts of the world, left American Samoa untouched, while there were thousands of deaths in other Samoan and South Sea islands. This was due to the rigid precautions adopted and sanitary measures enforced by our authorities. The natives this year received the highest price on record for their copra, which our authorities handle at their request; and conditions generally are so good that for the first time at the annual council of chiefs held on "Fono Day," not one complaint or suggestion of a change in laws or regulations was proposed.

The General Board has developed plans for making Guam, the center of a large area in the western Pacific, a strongly fortified naval base.

Distinguished Service Recognized.

The distinguished and meritorious service of the Navy personnel in the World War has been recognized and honored. Allied

nations have decorated a large number of officers and men of the Navy and Marine Corps who were privileged to serve across the seas. In pursuance of an act of Congress, the Navy Department was authorized to award distinguished-service medals and Navy crosses to officers and men who had rendered distinguished or conspicuous service. The act of Congress, authorizing these medals, sets forth as follows the character of service for which these distinctions are awarded:

That the President of the United States be, and he is hereby, authorized to present, in the name of Congress, a medal of honor to any person who, while in the naval service of the United States, shall, in action involving actual conflict with the enemy, distinguish himself conspicuously by gallantry and intrepidity at the risk of his life above and beyond the call of duty and without detriment to the mission of his command or the command to which attached.

That the President be, and he hereby is, further authorized to present, but not in the name of Congress, a distinguished-service medal of appropriate design, and a ribbon together with a rosette or other device to be worn in lieu thereof, to any person who, while in the naval service of the United States, since the 6th day of April, 1917, has distinguished, or who hereafter shall distinguish, himself by exceptionally meritorious service to the Government in a duty of great responsibility.

That the President be, and he hereby is, further authorized to present, but not in the name of Congress, a Navy cross of appropriate design and a ribbon, together with a rosette or other device to be worn in lieu thereof, to any person who, while in the naval service of the United States since the 6th day of April, 1917, has distinguished, or who shall hereafter distinguish, himself by extraordinary heroism or distinguished service in the line of his profession, such heroism or service not being sufficient to justify the award of a medal of honor or a distinguished-service medal.

A board, headed by Rear Admiral Knight, has given much time to the study of records, with an earnest desire to give recognition of courage and distinguished service. In a period when it may be truly said that every man in the Navy, at home and abroad, gave devoted and patriotic consecration to the duty assigned, medals might well have been given to hundreds of thousands. To select those who embraced opportunity for conspicuous service and valor has been no easy task. The duty has been conscientiously performed.

Naval Observatory's Work and Plans.

An international radio determination of differences of longitude to encircle the globe is proposed, and astronomers have indicated their desire that the Naval Observatory undertake this Government's share of the astronomical work and that the radio part be done by the Navy's radio service.

To furnish data needed for the American Ephemeris and Nautical Almanac, and improve the tables of the planets, moon, and stars,

the Naval Observatory plans to continue its observations for absolute positions of the fundamental stars and of the positions of stars, moon, and planets with reference to the equator and equinoxes. Demand for the American Nautical Almanac has largely increased, 5,153 copies of the 1918 issue being required, as compared with 1,165 copies of the 1916 edition. Five hundred copies of the Ephemeris were furnished to the American Expeditionary Force.

The production of navigational instruments by American manufacturers progressed so rapidly during the war that by November, 1918, the observatory was not only supplying the Navy but also 600 Shipping Board vessels and many Army transports and leased ships. The surplus remaining after the armistice has been absorbed by the requirements of vessels being completed by the Shipping Board, providing these ships with standard equipment.

Practically all the 32,000 glasses loaned by patriotic citizens to the Navy have been returned, with suitable acknowledgment of our appreciation of this valuable service.

The many instruments being turned in by vessels going out of commission are being sent to the repair shop of the observatory, and while this entails a large amount of work, it will convert what would otherwise be useless material into serviceable instruments.

Naval Intelligence.

Upon the close of hostilities the duties of Naval Intelligence reverted to normal operation. During the war it not only kept in touch with the naval thought and naval development throughout the world, but at home and abroad developed into a secret service agency that was the dread of spies, traitors, slackers, profiteers, and other evil forces that fatten on war. The story of its war work is one that will show its efficiency when written by those who were a part of this vigilant department of naval activity.

Naval History Being Recorded and Preserved.

The Navy made history in the World War, and it is our duty to see that it is recorded and preserved for our own as well as future generations. With this in view, there has been established a historical section, which is collecting, filing, and indexing naval war records, so they will be available for reference and for the use of historians. A number of monographs describing important naval activities are being prepared for publication. There is also in preparation a volume describing briefly the principal activities of the Navy, which we expect to have ready for publication early in 1920.

Efforts are being made to secure as complete a collection as possible of photographs, charts, maps, drawings, and publications relating to the work of the Navy. It is hoped that firms and private individuals, as well as men who served in the Navy, who have photo-

graphs or other material of historical interest will send either the originals or copies to the Historical Section, Navy Department, so that they may be preserved in our permanent war records.

Coast Guard's Service with the Navy.

The United States Coast Guard, which, in accordance with law, operated under the Navy Department for the period of the war, was by Executive order, transferred back to the Treasury Department on August 28, 1919. Its vessels and personnel made a valuable addition to our forces afloat, and its experienced officers and men proved their worth in service with those of the regular Navy and Naval Reserve Force.

Six Coast Guard cutters were employed in convoy and escort duty in European waters, the *Ossipee*, *Seneca*, *Yamacraw*, *Algonquin*, *Manning*, and *Tampa* forming a part of our forces based on Gibraltar, which escorted hundreds of vessels between the Mediterranean and Great Britain. It was while engaged in this duty that the *Tampa* was lost, with all her gallant officers and men, sunk at night in the English Channel by mine or torpedo. Only a short time before Rear Admiral Niblack had commended the *Tampa* in the warmest terms, recalling that it had steamed an average of 3,566 miles a month, being under way more than 50 per cent of the time; had escorted 18 convoys and had been kept in a state of high efficiency with an excellent ship spirit. This was typical of the service of the Coast Guard cutters in the war zone, and of the excellent record made by the Coast Guard while operating with the Navy. I wish to express my appreciation of the hearty cooperation of its officers and men, and of the way in which experience demonstrated the wisdom of the legislation which, in time of war, makes available the addition of this branch to our fighting forces.

A bill is pending in Congress to transfer the Coast Guard from the Treasury Department to the Navy. There is good reason and sound policy in putting all the Government's ships under the Navy, which has the facilities and the trained personnel and experience for their operation and care.

Coast and Lighthouse Service.

The Coast and Geodetic Service, assigned to duty with the Navy during the war, has been returned to the Department of Commerce. This service gave to the Navy good ships, capable navigators, and expert scientific men whose cooperation was so agreeable that the Navy parted from them with regret.

Women in the Navy.

There was a time when the Navy was said to be the one department of Government that could get along without women. But the war taught us that this supposition was incorrect. Before the

war it had been found necessary to enroll women nurses in naval hospitals and in aiding the native women of the Philippines, Guam, Samoa, and the Virgin Islands. Their service entitles them to the highest consideration. The imperative need for thousands of stenographers, typewriters and clerks in the early days of the war was met by enlisting women in the yeoman branch of the enlisted force, and, in all, more than 11,000 were enrolled. It had never been done before, but there was no law against it, and the new departure enabled the Navy to meet the emergency call and aided it greatly in the good record it made for efficiency. In obedience to the act of Congress, all the Yeomen (F), as they were called, (F signifying female), have been demobilized. Many of them remain as civilian clerks, Congress having made provision for their retention as clerks for the fiscal year. Numbers have taken the civil-service examination and will have permanent positions.

It was with genuine regret that the Yeomen (F) passed with the passing of war. They were truly enlisted for patriotic service in Washington and in every shore station, they released men for duty as soldier or sailor, and made a record of efficient performance of duty when their service was of the highest importance. Women also served in making and assembling the more delicate parts of torpedoes and in other branches of war service calling for skill and dexterity.

War Risk Insurance.

Upon their enlistment many men in the Navy availed themselves of the privilege of war risk insurance. It was a happy thought that placed such insurance within the reach of every man wearing his country's uniform. The opportunity of continuing this insurance should be embraced by every sailor and marine, and those who have permitted it to expire should see that their policies are restored. I chanced a few days ago to be looking over the papers of a 17-year-old boy from the mountains of Kentucky who was making his first cruise, and was glad to see that he had taken out \$10,000 worth of insurance and had made his mother the beneficiary.

Not a few mothers and wives live in comfort because their sons or husbands carried insurance policies in Uncle Sam's great insurance company. The sure way to induce Congress to make insurance permanent is for men in uniform to show their appreciation of the legislation. Why should not insurance at cost be extended by the Government to all in the public service?

Millions Invested in Liberty Bonds.

The men in the Navy did not stop buying bonds when the armistice was signed. They were among the largest buyers of Victory bonds,

and, upon pay that has been decreased by the decline in the purchasing power of a dollar, many of them have paid for these bonds by an economy which has required real sacrifice of the comforts of life. They were not only ready to give their lives in war, but to help pay the cost of war in peace.

Distinguished Visitors from Other Countries.

The country was honored, last June, by a visit from the President of Brazil, Dr. Epitacio Pessoa, who was returning from the peace conference in Paris to assume the duties of the high office to which he had been elected. An accident having occurred to the ship on which he embarked from France, a Navy transport took aboard President Pessoa and his party and brought them to America, and after his brief stay in this country we were privileged to convey him to Brazil in a United States battleship.

The visit of the King and Queen of the Belgians and Cardinal Mercier gave Americans an opportunity to express their admiration of that noble people who so bravely resisted invasion and by their heroic sacrifices rendered an invaluable service to civilization. They were accorded every honor, and the Navy was privileged not only to have them as guests on its vessels on voyage to and from Europe, but also on visits to the Naval Academy and other institutions.

The close cooperation of the British and American Navies during the war and their cordial relations made of especial interest the coming of the Prince of Wales, whose visit to the Naval Academy was one of the pleasing events of his brief stay in this country.

During the year ships of the British, French, Japanese, and Italian Navies have visited our ports, and we have been delighted to entertain officers and men of the forces with which we were associated in the war. Rear Admiral Johnke, of the Royal Danish Navy, director of the ministry of marine of Denmark, was one of our distinguished guests.

The Navy and the Peace Treaty.

The war demonstrated the wisdom of the epoch-making naval bill of August 29, 1916. Peace also bears testimony to its wisdom. Prior to the enactment of that legislation naval expansion was possible only by piecemeal in annual appropriations and authorizations. That act authorized the construction of 157 ships of the Navy, made provision for the necessary navy-yard expansion to make possible the construction of a portion of these ships in naval establishments by Navy personnel, and made the radical departure from the precedent of one-year to three-year provision. The coming of the war immediately demanding destroyers and more destroyers and small craft to meet submarine warfare, compelled concentration upon the

construction of the smaller craft and consequent delay in building the cruisers, dreadnaughts, and scout cruisers. As soon, however, as this pressing need was met, attention was given to the plans and contracts for the great ships authorized in the three-year program. Contracts have been let for all the ships authorized upon plans to incorporate the knowledge imparted by actual war conditions.

There was one provision in the Navy bill of 1916 which marked a departure in naval legislation which overrode precedent in the earnest desire to secure international agreement to prevent competition in big Navy building and the heavy burden it imposes upon the taxpayers of the world. That provision was the first recognition that it is to a war-making branch of government we may look for the longest step toward international peace the world has taken. Its significance was recognized by the President, who in his address in the evening of the day when he reviewed the Pacific Fleet in Puget Sound at Seattle, September 13, 1919, said:

All the nations agree to join in devising a plan for general disarmament. You have heard that this covenant was a plan for bringing on war. Well, it is going to bring on war by means of disarmament and also by establishing a permanent court of international justice. When I voted for that, I was obeying the mandate of the Congress of the United States. In a very unexpected place, namely, in a naval appropriation bill passed in 1916, it was declared to be the policy of the United States to bring about a general disarmament by common agreement, and the President of the United States was requested to call a conference not later than the close of the then present war for the purpose of consulting and agreeing upon a plan for a permanent court of international justice; and he was authorized, in case such an agreement could be reached, to stop the building program provided for by that naval appropriation bill. The Congress of the United States deliberately not only accepted, but directed the President to promote an agreement of this sort for disarmament and a permanent court of international justice. You know what a permanent court of international justice implies. You can not set up a court without respecting its decrees. You can not make a toy of it. You can not make a mockery of it. If you, indeed, want a court, then you must abide by the judgments of the court. And we have declared already that we are willing to abide by the judgments of a court of international justice.

The direction to which the President referred was incorporated in that section of the naval bill which authorized the three-year program. It has such international and lasting importance that the words of the text in the bill are incorporated here:

It is hereby declared to be the policy of the United States to adjust and settle its international disputes through mediation or arbitration, to the end that war may be honorably avoided. It looks with apprehension and disfavor upon a general increase of armament throughout the world, but it realizes that no single nation can disarm, and that without a common agreement upon the subject every considerable power must maintain a relative standing in military strength.

In view of the premises, the President is authorized and requested to invite, at an appropriate time, not later than the close of the war in Europe, all the

great Governments of the world to send representatives to a conference which shall be charged with the duty of formulating a plan for a court of arbitration or other tribunal, to which disputed questions between nations shall be referred for adjudication and peaceful settlement, and to consider the question of disarmament and submit their recommendation to their respective Governments for approval. The President is hereby authorized to appoint nine citizens of the United States, who, in his judgment, shall be qualified for the mission by eminence in the law and by devotion to the cause of peace, to be representatives of the United States in such a conference. The President shall fix the compensation of said representatives, and such secretaries and other employees as may be needed. Two hundred thousand dollars, or so much thereof as may be necessary, is hereby appropriated and set aside and placed at the disposal of the President to carry into effect the provisions of this paragraph.

If at any time before the construction authorized by this act shall have been contracted for there shall have been established, with the cooperation of the United States of America, an international tribunal or tribunals competent to secure peaceful determinations of all international disputes, and which shall render unnecessary the maintenance of competitive armaments, then and in that case such naval expenditures as may be inconsistent with the engagements made in the establishment of such tribunal or tribunals may be suspended when so ordered by the President of the United States.

It is ordinarily supposed not to be the function of navies, or within the province of a naval committee, to draft the chart by which a peace-loving nation hopes to navigate all ships of state into honorable and abiding peace. It is the glory of the Congress of 1916 that it forgot tradition and made a new precedent which guided the President and the American Peace Commission in proposing reduction of armament in the peace treaty. It is popularly supposed that the Navy is a fighting institution. It is that, and unless it is an effective instrument of war it fails in the purpose for which it was established. But fighting men, ready to surrender their lives for their country, and joyously, are the first to welcome sound measures to safely reduce armament and settle international differences in the forum of reason rather than in the conflict of battle. They agree with Joubert that there are two forces that rule the world—Force and Right—and they recognize with the great Frenchman that Force must rule until Right is ready. It was to open the way for the sway of Right that the 1916 bill authorized a conference like that which met at Paris and held out the hope to a war-troubled and war-cursed world that international agreements were possible and safe with the assurance that, when organized and functioning, reduction of armaments and reduced cost of war preparation would follow.

JOSEPHUS DANIELS.

REPORT OF THE SECRETARY OF THE INTERIOR.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., November 20, 1919.

MY DEAR MR. PRESIDENT: I wish to make report upon the administration of this department for the past year and in doing so to primarily deal with coal, electricity, and petroleum, as the three sources of light, heat, and power, and the need for the adoption of certain constructive policies affecting their production and distribution.

In an age of machinery the measure of a people's industrial capacity seems to be surely fixed by its motive power possibilities. Civilized nations regard an adequate fuel supply as the very foundation of national prosperity—indeed, almost as the very foundation of national possibility. I am convinced that there will be a reaction against the intense industrialism of the present, but as it must be agreed that the race for industrial supremacy is on between the nations of the world, America may well take stock of her own power possibilities and concern herself more actively with their development and wisest use.

THE COAL STRIKE.

The coal strike has brought concretely before us the disturbing fact that modern society is so involved that we live virtually by unanimous consent. Let less than one-half of 1 per cent of our population quit their work of digging coal and we are threatened with the combined horrors of pestilence and famine.

It did not take many hours after it was realized that the coal miners were in earnest for the American imagination to conceive what might be the state of the country in perhaps another 30 days. Industries closed, railroads stopped, streets dark, food cut off, houses freezing, idle men by the million hungry and in the dark—this was the picture, and not a very pleasant one to contemplate. There was an immediate demand for facts.

How much coal is normally mined in this country?

By whom is it mined?

What is its quality?

To what uses is it put?

Who gets it?

How much less could be mined if coal were conserved instead of wasted?

What better methods have been developed for using coal than those of ancient custom?

Who is to blame that so small a supply is on the surface?

Why should we live from day to day in so vital a matter as a **fuel supply?**

What substitutes can be found for coal and how quickly may these be made available?

This is by no means an exhaustive category of the questions which were put to this department when the strike came. And these came tumbling in by wire, by mail, by hand, from all parts of the country, mixed with disquisitions upon the duty of Government, the rights of individuals as against the rights of society, the need for strength in times of crisis, calls for nationalization of the coal industry, for the destruction of labor unions, for troops to mine coal, and much else that was more or less germane to the question before the country.

Many of these questions we were able to answer. But if coal operators themselves had not carried over the statistical machinery developed during the war, we would have been forced to the humiliating confession that we did not know facts which at the time were of the most vital importance.

In a time of stress it is not enough to be able to say that the United States contains more than one-half of the known world supply of coal; that we, while only 8 per cent of the world's population, produce annually 46 per cent of all coal that is taken from the ground; that 35 per cent of the railroad traffic is coal; that in less than 100 years we have grown in production from 100,000 tons to 700,000,000 tons per annum; that if last year's coal were used as construction material it would build a wall as huge as the Great Wall of China around every boundary of the United States from Maine to Vancouver, down the Pacific to San Diego and eastward following the Mexican border and the coast to Maine again; and that this same coal contains latent power sufficient to lift this same wall 200 miles high in the air, according to one of our greatest engineers (Steinmetz).

Such facts are surely startling. They serve to stimulate a certain pride and give us a great confidence in our industrial future; yet they are not as immediately important, when the mines threaten to close, as would be a few figures showing how much coal we have in stock piles and where it is! And months since we called upon Congress to grant the money that we might secure these figures, but no notice was taken of the urged requests until, late in the summer, a committee of the Senate awoke to this need and indorsed our petition.

NATIONAL STOCK TAKING.

The Government should have a more complete knowledge of the coal and of other foundation industries than can be found elsewhere, and we should not fear national stock taking as a continuing process. It is indeed the beginning of wisdom. The war revealed to us how

delinquent in this regard we had been in the past. One day when the full story is told of the struggle of the Army engineer to meet war emergency demands, and this is supplemented by the tale of the effort made by the Council of National Defense and the War Industries Board, it will be realized more seriously than now how little of stock taking we have done in this generous, optimistic land.

When any such undertaking is proposed, however, it at once appears to arouse the fear that it is somehow the beginning of a malevolent policy called "conservation," and conservation has had a mean meaning to many ears. It connoted stinginess and a provincial thrift, spies in the guise of Government inspectors, hateful interferences with individual enterprise and initiative, governmental haltings and cowardices, and all the constrictions of an arrogant, narrow, and academic-minded bureaucracy which can not think largely and feels no responsibility for national progress. Needless to say this fear should not, need not be. The word should mean helpfulness, not hindrance—helpfulness to all who wish to use a resource and think in larger terms than that of the greatest immediate profit; hindrance only to those who are spendthrifts. A conservation which results in a stalemate as between the forces of progress and governmental inertia is criminal, while a conservation that is based on the fuller, the more essential use of a resource is statesmanship.

To know what we have and what we can do with it—and what we should not do with it, also!—is a policy of wisdom, a policy of lasting progress. And in furtherance of such a policy the first step is to know our resources—our national wealth in things and in their possibilities; the second step is to know their availability for immediate use; the third step is to guard them against waste either through ignorance or wantonness; and the fourth step is to prolong their life by invention and discovery.

COAL AS A NATIONAL ASSET.

Enough has been said, perhaps, to indicate how vast are the fields of coal which this country holds. It may be that any day some genius will release from nature a power that will make of little value our carboniferous deposits save for their chemical content. By the application of the sun's rays, or the use of the unceasing motion of the waves of the sea, the whole dependence of the world upon coal may be upset. That day, however, has not yet come; and until it does we may consider our coal as the surest insurance which we can have that America can meet the severest contest that any industrial rival can present. It is more than insurance—it is an asset which can bring to us the certainty of great wealth, and if we care to exercise it, a mastery over the fate and fortunes of other peoples.

Next to the fertility of our soil, we have no physical asset as valuable as our coal deposits. Although we are sometimes alarmed because those deposits nearest to the industrial centers are rapidly declining and we can already see within this century the end of the anthracite field, if it is made to yield as much continuously as at present, yet it is a safe generalization that we have sufficient coal in the United States to last our people for centuries to come. An extra scuttleful on the fire or shovelful in the furnace does not threaten the life of the race, even if some Russian or Chinese of the future does not resolve the atom or harness the hidden forces of the air. Whatever fears other nations may justifiably have as to their ability to continue in the vast rush of a machine world, there can be no question of our ability to last.

The present strike, however, makes quite clear, perhaps for the first time, that it is not the coal in the mountain that is of value, but that which is in the yard. And between the two there may be a great gulf fixed. Therefore, we are put to it to make the best of what we have. We turn from telling how much coal we use to a study of how little we can live upon and do the day's work of the Nation. And this is, I believe, as it should be. Indeed I feel justified in saying that the problem of this strike is not to be solved in its deeper significances until we know much more about coal than we know now, and this especially as to the manner in which it is taken from its bed and brought to our cellars.

PUBLIC RESPONSIBILITY.

This transfer is effected by a kind of carrier chain, the links of which are the operator, the miner, the railroad, and the public. We choose, to please ourselves, the link in this chain upon which we place the responsibility for its failure to work; but before indulging ourselves in abuse of arrogant coal barons or dictatorial labor unions, it may be as well to ask whether we of the public are not responsible in some part for this failure to function. I do not refer now to the failure of society to provide methods of industrial mediation or other adjustment of such labor difficulties. My question is, whether or not the public is at all at fault when a nation wealthy beyond all others in coal finds itself with so small a supply on hand when a strike comes—but a few days removed from the gravest troubles. The answer, to my mind, turns upon the manner in which we have done business.

We have been content to go without insurance as to a coal reserve. Each day has brought its daily supply. There was no thought of railroads stopping or mines closing down, so that large storage facilities have not been provided, and, indeed, we would rebel at paying for our coal the added cost of caring for it outside its native warehouse. We have not thought in terms of apprehension, but, as

always, in the calm certainty that the stream of supply would flow without ceasing. In some way there would be coal into which we could drive our shovels when the need was felt.

No wonder, therefore, that we are rudely disturbed when one link in the carrier chain—from coal-in-place to coal-in-the-furnace breaks. It simply is one of those things which doesn't happen. And not having happened sufficiently often to give us fear, we have had no thought that we should provide against it. It is a most heterodox thing to say, but we may find that a bit more foresight on the part of the public would certainly have made less sudden the present crisis. Let us look, for instance, into the matter of the coal miners' year and see if it is not fixed in some degree by the habit of the public in its purchasing.

THE MINERS' YEAR.

The record year, 1918, with everything to stimulate production had an average of only 249 working days for the bituminous mines of the country. This average of the country included a minimum among the principal coal-producing States of 204 days for Arkansas and a maximum of 301 for New Mexico. In such a State as Ohio the average working year is under 200 days. In 1917 the miners of New Mexico reached an average of 321 days, and in the largest field, the Raton field, it was actually 336—probably the record for steady operation.

This short year in coal-mine operation is due in part to seasonal fluctuation in demand. The mines averaged only 24 hours a week during the spring months. The weekly report of that date showed that 80 per cent of the lost time was due to "no market" and only 15 per cent to "labor shortage," while "car shortage" was a negligible factor. In contrast with this should be taken the last week before the strike, when the average hours operated were 39 and "no market" was a negligible item in lost time, while "car shortage" was by far the largest item. It follows that the short year is a source of loss to both operator and mine worker and is a tax on the consumer.¹

¹ In spite of the strike order, effective the last day of the week, the production of soft coal during the seven days Oct. 26–Nov. 1 was greater than in any week this year save one. The exception was the preceding week, that of Oct. 25, which full reports now confirm as the record in the history of coal mining in the United States. The total production during the week ended Nov. 1 (including lignite and coal made into coke) is estimated at 12,142,000 net tons, an average per working day of 2,024,000 tons.

Indeed had it not been for the strike, curtailing the output of Saturday, the week of Nov. 1 would have far outstripped its predecessor. The extraordinary efforts made by the railroads to provide cars bore fruit in a rate of production during the first five days of the week which, if maintained for the 304 working days of full-time year, would yield 715,000,000 tons of coal. It is worth noting that this figure is almost identical with the 700,000,000 tons accepted early in 1918 by the Geological Survey and the Railroad Administration as representing the country's annual capacity. During these five days, therefore, the soft-coal mines were working close to actual capacity. There can be little doubt that the output on Monday, Oct. 27, was the largest ever attained in a single day. (U. S. Geol. Survey Bull.)

With substantially the same number of mines and miners working this year as last, the accumulative production for the first 10 months of this year is 100,000,000 tons less than that mined in the same period last year. This 25 per cent loss in output means that both plant and labor have been less productive, and, in terms of capital and labor, coal cost the Nation more this year than last. For in the long run both capital and labor require a living wage.

The public must accept responsibility for the coal industry and pay for carrying it on the year round. Mine operators and mine workers of whatever mines are necessary to meet the needs of the country must be paid for a year's work. The shorter the working year the less coal is mined per man and per dollar invested in plant, and eventually the higher priced must be the coal. It is obvious that the 264 short tons of coal mined by the average British miner last year could not be as cheap per ton as the 942 tons mined by the average American mine worker, backed up as he was with more efficient plant. (A proud contrast!)

It would clearly appear that the coal business may be stabilized, not wholly, but in a very large measure, in some of the western fields,¹ if the public does not regard its supply of coal as it does its supply of domestic water, which requires only that the faucet shall be opened to bring forth a gushing supply. Coal does not have pressure behind it which forces it out of the mine and into the coal yard. It rather must be drawn out by the suction of demand. And herein the public must play its part by keeping that demand as steady and uniform as possible.

HAVE WE TOO MANY MINES AND MINERS?

The problem of the miner and his industry may be stated in another way. We consume all the coal we produce. We produce it with labor that upon social and economic grounds works as a rule too few days in the year. We therefore must have a longer miners' year and fewer miners or a longer miners' year and additional markets. One or the other is inevitable unless we are to carry on the industry as a whole as an emergency industry, holding men ready for work when they are not needed in order that they may be ready for duty when the need arises. There are too many mines to keep all the miners employed all of the time or to give them a reasonable year's work. This conclusion is based on the assumption that we now produce only enough coal from all the mines to meet the country's demand, which is the fact. More coal produced would not sell more coal, but more coal demanded would result in greater

¹ It is the western and southern fields that are most affected by the seasonal demand. As a typical example, Illinois may be cited, with 18 per cent of the year's production in 25 per cent of the time, April, May, and June, in 1915, and 15 per cent in 1916. Retail dealers received 27 per cent of the coal from Illinois in the period from August, 1918, to February, 1919, compared with 4 per cent from the Pittsburgh, Pa., field.

coal production. With the full demand met by men working two-thirds or less of the time in the year there can not be a longer year given to all the miners without more demand for coal. This seems to be manifest. Therefore the miners must remain working but part time as now, or fewer miners must work more days, or market must be found for more coal and thus all the miners given a longer year. If we worked all of our miners in all of our mines a reasonable year, we would have a great overproduction. And to have all our mines work a longer period means that we must find some place in which to sell more coal, either at home or abroad.

Why have we so many mines working so many miners? There can be no one-word reply to this question. It penetrates into almost every social and economic condition of the country—the initiative of capital, the size of the country, the pride of localities, the intense competition between railroads, their inability to furnish cars when needed, the manner in which cars are apportioned between mines, the manner in which the railroads are operated so that movement is slow and equipment is short, and this runs into the need for new facilities, such as more yards, more tracks, more equipment, which brings us into the need for more capital and so on and on.

We have none too many mines or too many miners to supply our need if the mines are operated as at present. But we have too many to fill that need if they are operated on a basis nearer to 100 per cent of possible production.

THE LONG VIEW.

Passing from the labor phase of the coal situation to the larger aspect of our coal supply as related to the whole problem of the economical production of light, heat, and power, which Sir William Crookes has characterized as “first among the immediate practical problems of science,” we find ourselves both rich and wasteful, following the primrose path, heedless of the morrow and not yet conscious that the morrow is to be a day of battle.

In the first place we treat coal as if it were a thing which was exclusively for home use, a nonexportable commodity which must be used “on the farm,” whereas it should be treated with profound respect, because we know from Paris that sacred treaties and national boundaries turn on its presence. The world wants our coal, envies us for having it, fears us because of it. It is not only useful to us, but it has a cash value in the markets of the world. Therefore it should be saved.

In the next place we treat coal as if it were all alike, not selected by nature for specific uses; whereas we should choose our coal with as scientific a judgment as we choose our reading glasses. There is coal for coke and coal for furnaces and coal for house use and coal

adapted for one kind of boiler and a different kind of coal for a different kind of boiler. Therefore we should discriminate in coal.

And again we have shown little willingness to dignify coal by seeking to draw out by improved mechanical processes all the stored content of heat in this lump of carbon. Instead we content ourselves by giving it a mere pauper touch, driving off the greater volume of its value into the air. This is a task for the mechanical engineer.

Then, too, there is the problem of using coal in the form of steam or in the more exalted form of electric current. The lifting, bobbing lid of James Watt's teakettle did not speak the last word in power. We are only beginning to know how we may move on from one form of motive power to another. The wastefulness of steam power as contrasted with electric power is a real challenging problem in conservation by itself.

And then we naturally ask, Why this long haul over mountains and through tunnels and across bridges and along streets and into houses, by railroad, truck, and on the backs of men, when at the very pit mouth, or within the mine itself, this same coal might be transformed into electricity and by wire served into factories and homes 100, 200, 300 miles from the mine? Why burden our congested railroads with this traffic? Why strew our streets with this dirt? This may be a practicable thing, a wise thing; it deserves study if coal is worth conserving.

Are there no substitutes for coal which we can use and can not export? This question immediately raises the water-power possibilities of our land, of which only the most superficial study has been made. Sell coal and use electricity would appear a thrifty policy.

As petroleum is being used as a substitute for coal—and inasmuch as the whole problem of fuel supply is one—we are ultimately compelled to an investigation of the ability of our petroleum supply to meet its present drain and to meet the expansion in its use, which is the most surprising development of our day in the study of power creation.

This spells a program of development and conservation which should challenge the ambitions of this Nation, and on a few of its features perhaps a few further words would be justified.

SAVING COAL.

The two ways by which coal in greatest volume can be saved are the discovery of the method by which more power can be taken from the ton and the discovery of what kind of coal is best fitted for any particular use.

It has been everyone's business to save coal, hence The railroads have experimented with some success. They get perhaps 10 per

cent of the heat energy from a ton shoveled beneath the locomotive boiler, 10 per cent of the total in the ton. They use one-quarter of all the coal mined. Next to labor this is the greatest expense which our railroads have. This shows how great the problem is to them. Some have adopted a system of paying a bonus for the greatest distance made on a given quantity of a given coal. But this laudable effort has not met with the cooperation that would be expected from the firemen, for reasons that go far afield. Industries, especially those which generate electric power, have made similar effort to gain from their fuel its greatest potentiality, and with varying success. We can overlook the stoking of the domestic furnace as a national concern, for the amount of coal used in this way amounts to not more than 17 per cent of the national coal bill, and this whole charge could be saved, it is estimated, by giving care to the 75 per cent of our coal which is burned under boilers to make steam. Here there is a maximum figure of 13 per cent of the energy of the coal put into harness, and the average is less than 10 per cent, even in the larger plants.

In one establishment visited by the fuel engineers of this department during the war a preventable waste of 40,000 tons a year was discovered. By changes in the admission of air to the furnaces and in the "baffling" of the boilers the engineers of the Bureau of Mines are confident that they have been able to increase the economy of coal in the ships of the Emergency Fleet Corporation by 16 per cent, making 6 pounds of coal do the work of 7. If such a percentage of economy could be generally effected it would mean the saving of as much coal as France and Italy together will need in this year of their greatest distress.

COAL AND COAL.

The Government should sample and certify coal. We do this as to wheat and meat; it is just as necessary to avoid injustice in the case of coal, and it is thoroughly practicable. The public should know the kind of coal it is buying, because it should buy the coal it needs. There need be no prohibition against the mining or selling of any coal,¹ but coal should sell in terms of its capacity to de-

¹ In every trainload of coal hauled from the mines to our coal bins, 1 carload out of every 5 is going nowhere. In a train of 40 cars, the last 8 are dead load that might better have been left in the bowels of the earth. No less an authority than Martin A. Rooney states: "Every fifth shovel full of coal that the average fireman throws into his furnace serves no more useful purpose than to decorate the atmosphere with a long black stream of precious soot. At best one-fifth of all our coal is wasted."

The first requisite toward effecting fuel economy is to secure cooperation between owners, managers, and the men who fire the coal. Mechanical devices to increase efficiency in the use of coal can not produce satisfactory results unless the operators who handle them are impressed with the importance of their duties.

It is not essential for the plant manager to be a fuel expert, but he should be familiar with the instruments that give a check on the daily operations. It is a mistake not to provide proper instruments, for they guide the firemen and show the management what

liver heat. Some coal that is only a pint bottle is selling as a quart bottle. And the quart is hurt by the competition of the pint. A bill to effect such fuel inspection has been drafted and will be presented to Congress. It is not a bill commanding anything, but rather gives to those who are willing an opportunity to have their product inspected and attested and thus acquire merit in the eye of the world as against those who are not willing to subject their coal to the official test tube. Coal is coal in the sense of the classic traffic classification. Coal is, however, not always coal, nor is it altogether coal when put to the pragmatic test of the furnace. If such a bill were passed it would promote the interests of those who schedule their price upon the merit of their goods and make against the hauling of slate and dirt, its storage and handling under an assumed name. The plan is not to punish the malefactor who attempts to impose upon the public a slender number of thermal units as a ton of coal, but rather to give to every man an opportunity to advertise the number of such units which his particular article contains, thus enabling the injured public to strike against an unfair mine.

Furthermore we are to become great exporters of coal, unless all signs fail, and such certification should be required as to every ton sent abroad.

EXPANSION ABROAD.

It has been said that we have too many mines in operation, as we appear to have too many miners, if we are to maintain only our present output. Rapid expansion in the development of industry in general may justify the existence of such mines and so large a corps of workers, even with an adequate car supply and more abundant local storage facilities, which are greatly needed in almost all places, and a more even demand. If, however, this should not be so, there is a foreign demand for the best of our bituminous coals, which at present we are altogether unable to meet for lack of credits on the part of those who wish the coal, and lack of ships to carry it. England's annual production has fallen 100,000,000 tons, according to

has taken place daily. Instruments provided for the boiler room manifest the interest taken by the management toward conserving fuel. It indicates cooperation and encourages the firemen to work harder to increase the efficiency.

A second factor effecting fuel economy is the selection of fuel for the particular plant. It is not expected of a plant manager that he should be thoroughly informed as to the character of all fuels; but he can enlist the services of a man who is thoroughly trained in this field. The Bureau of Mines has compiled valuable information on the character and analyses of coal from almost every field in the United States. Information concerning the character and chemical constituents of the coal, together with knowledge pertaining to the equipment of the plant, makes it possible to select a fuel adapted to the equipment, thereby insuring better combustion. Hundreds of boiler plants operate at no greater than 60 per cent efficiency, and it would be a comparatively simple matter to bring them up to 70 per cent efficiency. The saving in tonnage would be more than the combined yearly coal-carrying capacity of the Baltimore & Ohio and the Southern Railway systems. The direct saving to our industries at \$5 per ton would amount to \$200,000,000 worth of coal per year.

Mr. Hoover, and the European demand next year will be more than 150,000,000 tons above her production. Whatever the world need, it can not be supplied. It is too large for any possible supply by ship, even if all necessary financial arrangements could be made, either by loan or credit. Europe, indeed, will sadly learn through this winter how little coal she can live on and how more than perilous is the state of a people who are short of power, light, and heat.

As this country prior to the war sold abroad no more than 4,500,000 tons as against England's 77,000,000, it is quite manifest that here will be a new field for American enterprise, the enterprise being needed not for the winning of markets as much as for finding ways of dealing with the larger phases of a heavy overseas trade with those who are without immediate resources.

SAVING COAL BY SAVING ELECTRICITY.

It is three years since Congress was urged that we should be empowered to make a study of the power possibilities of the congested industrial part of the Atlantic seaboard, with a view to developing not only the fact that there could be effected a great saving in power and a much larger actual use secured out of that now produced, but also that new supplies could be obtained both from running water and from the conversion of coal at the mines instead of after a long rail haul. A stream of power paralleling the Atlantic from Richmond to Boston, a main channel into which run many minor feeding streams and from which diverge an infinite number of small delivering lines—the whole an interlocking system that would take from the coal mine and the railroad a part of their present burden and insure the operation of street lights, street cars, elevators, and essential industries in the face of railroad delinquencies—this is the dream of our engineers, and a very possible dream it has seemed to me; of such value, indeed, that we might well spend a few thousand dollars in studying it, not with the thought that the Government would construct or operate even the trunk line, but that it might so attract the attention of the engineering and financial world as to make it a reality.

To tie together the separated power plants of 10 States so that one can give aid to the other, so that one can take the place of the other, so that all may join their power for good in any great drive that may be projected—this would be the prime purpose of the plan; and from this would evolve the development of the most practicable method of supplying this vast interdependent system with more power—perhaps from the conversion of coal, as it drops from the very tippie, using the mine as one might use a waterfall, or by the development of great hydroelectric plants on the many streams from the Androscoggin to the James.

WHITE COAL AND BLACK.

This would be a plan for the wedding of the stream and the mine, the white coal with the black. "White coal" they call it in imaginative France, this tumbling water which is converted into so many forms; and a much cleaner, handier kind of coal it is than its black brother. And cheaper, for the water goes on to return again and fall once more and forever into the pockets of the turbine which whirls the dynamo and so gathers or releases that mystery which we name but never define. Farsighted, purposeful Germany fought four and a half years upon the strength of great power plants run by the snows of the Alps. She did not rely on these alone for power, nor were they her main reliance, but they gave her a lasting power which otherwise she would not have had. And we may expect her to improve on that war-time experience for the conduct of the hard fight she is to make in the industrial field. France saved enough territory from the invader to permit her to make new adventures into this field and so to some degree offset the coal loss of Lens. Italy found that she had still left unused opportunities for hydroelectric development sufficient with the coal she could secure from England and America to see her through the war. And with coal conditions as they are in Europe we may expect a still greater push to make use of water power to turn the industrial wheels of peace. It must be so likewise here.

And it is likely that the long-pending power bill which will make available the dam and reservoir sites on withdrawn public lands and make feasible the financing of many projects on both navigable and unnavigable streams will soon have become law. We shall then have an opportunity that never before has been given us to develop the hydroelectric possibilities of the country. And this raises the question as to their extent.

The theoretical maximum quantity of hydroelectric power that can be produced in the United States has recently been estimated by Dr. Steinmetz, who calculates that if every stream could be fully utilized throughout its length at all seasons, the power obtained would be 230,000,000 kilowatts (320,000,000 horsepower). It is clear that only a fraction of this absolute maximum can ever be made available. The Geological Survey estimates that the water power in this country that is available for ultimate development amounts to 54,000,000 continuous horsepower.

The census of 1912 showed that the country's developed water power was 4,870,000 horsepower, about 9 per cent of the maximum power available for economic development and less than 2 per cent of the total that may be supplied by the streams as estimated by Dr. Steinmetz. According to the census, stationary prime movers representing a capacity of more than 30,000,000 horsepower, fur-

nished by water, steam, and gas, were in operation in the United States in 1912. (This amount does not, of course, include power generated by locomotives, marine engines, automobiles, and similar mobile apparatus.) The average power furnished by these stationary prime movers was probably not more than 20 per cent of their installed capacity, so that the power produced in 1912 was equivalent to probably not more than 6,000,000 continuous horsepower.

As the estimated available water power given above represents continuous power the country evidently possesses much more water power than it now requires, so that there would be an ample surplus for many years if the power were so distributed geographically that it could be economically supplied to the industries that need it. But as a matter of fact the water-power resources of the country are by no means evenly distributed. Over 70 per cent of the available water power is west of the Mississippi, whereas over 70 per cent of the total horsepower now installed in prime movers is east of the river. Therefore unless the East is to lose its industrial supremacy it must press and press hard for the development of all water-power possibilities!

THE AGE OF PETROLEUM.

For a full century now we have been passing through different phases of industrial and commercial life which have been characterized by some form of power. First the age of steam, and then the age of electricity. We have passed out of neither and yet we have come into another age—that of petroleum. As a lubricant, it has become of such universal use that it has been called the barometer of industry, and no doubt after it has ceased to be a popular illuminant or a source of power it will live invaluable as the thing which lets the wheels go round. Its greatest popularity now arises out of its use in the internal-combustion engine, and of the making of these there is no end. It draws railroad trains and drives street cars. It pumps water, lifts heavy loads, has taken the place of millions of horses, and in 20 years has become a farming, industrial, business, and social necessity. The naval and the merchant ships of this country and of England are fitted and being fitted to use it either under steam boilers as fuel or directly in the Diesel engine. The airplane has been made possible by it. It propels that modern juggernaut, the tank. In the air it has no rival, while on land and sea it threatens the supremacy of its rivals whenever it appears. There has been no such magician since the day of Aladdin as this drop of mineral oil. Medicines and dyes and high explosives are distilled from it. No one knows whence it cometh or whither it goeth. Men search for it with the passion of the early Argonauts, and the promise now is that nations will yet fight to gain the fitful bed in which it lies.

In Persia and in Palestine, in Java and in China, in southern Russia and in Rumania we know that petroleum is, for it has been found there. How great these fields or others in Europe, Asia, or Africa may be no one would dare to say. As yet, however, the petroleum of the world has come from this hemisphere.

The "oil spring" which George Washington found in western Virginia and by his last will called to the especial consideration of his trustees was the promise of a continental well which last year yielded 356,000,000 barrels. Each year has seen the prophecy unfulfilled that the peak of the possible yield had been reached.

From the mountains of western Pennsylvania into the very ocean bed of the Pacific and even beyond and into the broken strata of upturned Alaska, the oil prospector bored with his sharp tooth of steel and found oil. Hardly has one field fallen into a decline when another has come rushing into service. Only three years ago and all hopes were centered in Oklahoma, and then came Kansas, and then the turn went south again to Texas, and now it looks toward Louisiana. Geologists have estimated and estimated, and they do not differ widely, for few give more than thirty years of life to the petroleum sands of this country if the present yield is insisted upon. And yet there is so much of mystery in the hiding of this strange subterranean liquid that honest men will not say but that it will become a permanent factor in the world of light, heat, and power. If this is not so we are a fatuous people, for with every fifth man in the country the owner of an automobile and the expenditure of hundreds of millions of dollars for roads fit only for their use, and with ships by the hundred specially constructed to burn oil, we have surely given a large fortune in pledge of our faith that our pools of petroleum will not soon be drained dry, or that others elsewhere will come to our help.

In 1908 the country's production of oil was 178,500,000 barrels, and there was a surplus above consumption of more than 20,000,000 barrels available to go into storage. In 1918, 10 years later, the oil wells of the United States yielded 356,000,000 barrels—nearly twice the yield of 1908—but to meet the demands of the increased consumption more than 24,000,000 barrels had to be drawn from storage. The annual fuel-oil consumption of the railroads alone has increased from $16\frac{2}{3}$ to $36\frac{3}{4}$ million barrels; the annual gasoline production from 540,000,000 gallons in 1909 to 3,500,000,000 gallons in 1918. This reference to the record of the past may be taken not only as justifying the earlier appeal for Federal action, but as warranting deliberate attention to the oil problem of to-day.

Fuel oil, gasoline, lubricating oil—for these three essentials are there no practical substitutes or other adequate sources? The obvious answer is in terms of cost: the real answer is in terms of man power. Whether on land or sea, fuel oil is preferred to coal because it re-

quires fewer firemen, and back of that, in the man power required in its mining, preparation, and transportation the advantage on the side of oil is even greater. So, too, the substitute for gasoline in internal-combustion engines, whether alcohol or benzol, means higher cost and larger expenditure of labor in its production.

There are large bodies of public land now withdrawn, which, under the new leasing bill which seems so near to final passage after seven years of struggle and baffled hope, will in all likelihood make a further rich contribution to the American supply.

OIL SHALE.

And beyond these in point of time lie the vast deposits of oil shale which by a comparatively cheap refining process can be made to yield vastly more oil than has yet been found in pools or sands. The value of this oil shale will depend upon the cheapness of its reduction, and this must be greatly lessened by the value of by-products before it can compete with coal or the oil from wells. There is every reason to believe, however, that some day the production of oil from shale will be a great and a permanent industry. And the country could make no better immediate investment than to give a large appropriation for the development of an economical shale-reducing plant.

So conservative an authority as the Geological Survey estimates that the oil shales of the Western States alone contain many times over the quantity of oil that will be recovered from our oil wells. The retorting of oil from oil shale has been a commercial industry for many years in Scotland and France; in fact, oil was obtained from oil shale here in the United States before the first oil well was drilled. The industry is in process of redevelopment to-day and if successful will assure us of a future supply, but at the best it will take years of time and a vast investment of capital to build up the industry to such a point that it can supply any considerable proportion of our needs. It is imperative, however, that the development of this latent resource be furthered and brought to a state of commercial development as soon as possible.

SAVE OIL.

Yet with all the optimism that can be justified I would urge a policy of saving as to petroleum that should be rigid in the extreme. If we are to long enjoy the benefits of a petroleum age, which we must frankly admit fits into the comfort-loving and the speed-loving side of the American nature, we must save this oil.

We must save it before it leaves the well; keep it from being lost; keep it from being flooded out, driven away by water. Through the cementing of wells in the Cushing field, Oklahoma, the daily volume of water lifted from the wells was decreased from 7,520 barrels to 628 barrels, while the daily volume of oil produced was increased

from 412 barrels to 4,716. These instances show what can and should be done in our known oil fields.

We must save the oil after it leaves the well, save it from draining off and sinking into the soil, save it from leaking away at pipe joinings, save it from the wastes of imperfect storage.

Then we come to the refining of the oil. How welcome now would be the knowledge that we could recover what was thrown away when kerosene was petroleum's one great fraction. (The loss in refineries is still startling, some 14,556,000 barrels last year—4½ per cent of the crude run in the refineries.)

The self-interest of the American refiner, notably the Standard Oil Co., has done a work that probably no mere scientific or noncommercial impulse could have equaled, in torturing out of petroleum the secrets of its inmost nature. And yet the thought will not altogether give place that in that residue which goes to the making of roads or to be burned in some crude way there may be things chemical that will work largely for man's betterment. This is the fact, too—that where the oil is produced by some small companies which have not the financial ability to make it yield its full riches there is a greater danger of loss of this kind. It would be well indeed if there could be such regulation as would require that all petroleum must be refined. That this is done generally is not denied. It should be universal. And all the skill and study and knowledge of the ablest of chemists and mechanicians should find themselves challenged by the problem of petroleum.

Coming to the use of petroleum in its various forms we find a field of promise. The engine that doubles the number of miles that can be made on a gallon of gasoline doubles our supply. There is where we can apply the principle of true conservation—find how little you need; use what you must, but treat your resource with respect. Has the last word been said as to the carburetor? Mechanical engineers do not think so. Have all possible mixtures which will save oil and substitute cheaper and less rare combustibles therefor been tried? Men by the hundred are making these experiments, and almost daily the quack or the stock promoter comes forward with the announcement of a discovery which proves to be a revelation—a revelation of human stupidity or criminal cupidity. On this line the men of science do not sing a song of the richest hope; they shrug their shoulders, exclaiming with uplifted hands: "Well, may be, may be."

There are possible substitutes for some petroleum products, but not for the whole barrel of oil; furthermore, petroleum is the cheapest material, speaking quantitatively, from which liquid fuels and lubricants can be made; therefore, any substitutes obtained in quantity must cost more. Alcohol can be substituted for gasoline, but

only in limited quantity and at increased cost. Benzol from by-product coking ovens also can be used, but quantitatively is totally inadequate. For kerosene no quantitative substitute is known. Lubricants can be obtained from animal and vegetable fats, but mostly are inferior in quality, and there seems no hope of obtaining them in quantity. Fuel oil can be largely supplanted by coal, but for the internal-combustion engine there is no quantitative substitute.

USE THE DIESEL ENGINE.

We have ventured on a great shipbuilding program. Our people are to once again respond to the call of the sea. On private ways and on Government ways ships are being built to go round the world—ships that are to burn oil under boilers and produce steam. I presume that there is a justification for this policy, perhaps one that is as good, if not better, than can be made for the railroads of the West pursuing the same policy. I submit, however, that there should be justification shown for the construction of any oil-burning ship which does not use an engine of the Diesel type. To burn oil under a boiler and convert it into steam releases but 10 per cent of the thermal units in the oil, whereas if this same fuel oil were used directly in a Diesel engine, 30 to 35 per cent of the power in the oil would be secured. Substitute the internal-combustion engine for the steam boiler and we multiply by three or three and one-half the supply of fuel oil in the United States. Instead of our fuel-oil supply being, let us say, 200,000,000 barrels, it would at once rise to 600,000,000 barrels or 700,000,000. I recognize that this is an impractical and unrealizable hope as applied to things as they are, but there is no reason why this should not be a very definite policy as to things that are to be.

This Government might itself well undertake to develop an engine of this type for use on its ships, tractors, and trucks. We simply can not afford to preach economy in oil when we do not promote by every means the use of the internal-combustion engine for its consumption. No other one thing that can be done by the Government, our industries, or the people will save as much oil from being wasted and thereby multiply the real production of the United States. If such engines are delicate of handling and need specially trained engineers, which appears to be the fact, there should be little difficulty experienced in training men for such work. A nation that could educate 10,000 automobile mechanics in 60 days might indeed develop 1,000 Diesel engineers in a year. The matter is of too great moment for delay. It touches the interest of everyone. We are in the petroleum age, and how long it will last depends upon our own foresight, inventiveness, and wisdom.

WANTED—A FOREIGN SUPPLY.

Already we are importers of petroleum. We are to be larger importers year by year if we continue—and we will—to invent and build machines which will rely upon oil or its derivatives as fuel. Our business methods have been and doubtless will continue to be developed along lines that make a continuing oil supply a necessity. Some of that oil must come from abroad, as nearly 40,000,000 barrels did last year, and for that we must compete with the world. For while we are the discoverers of oil and of the methods of securing it and refining it, piping it, and using it, our pioneering is but a service unto the world.

This situation calls for a policy prompt, determined, and looking many years ahead. For the American Navy and the American merchant marine and American trade abroad must depend to some extent upon our being able to secure, not merely for to-day but for to-morrow as well, an equal opportunity with other nations to gain a petroleum supply from the fields of the world. We are now in the world and of it in every possible sense, otherwise our Navy and our merchant fleet would have no excuse. No one needs to justify them—they are the expression of an ambition that carries no danger to any people. For their support we can ask no preference, but in their maintenance we can insist that they shall not be discriminated against.

Sometime since I presented to a board of geologists, engineers, and economists in this department this question:

If in the next five years there should develop a new demand for petroleum over and above that now existing, which would amount to 100,000,000 barrels a year, where could such a supply be found, and what policy should be adopted to secure it?

The conclusions of this board may be summarized as follows:

- (1) Such an oil need could not be met from domestic sources of supply.
- (2) It could not be assured unless equal opportunities were given our nationals for commercial development of foreign oils.
- (3) Assurance of this oil supply therefore inevitably entails political as well as commercial competition with other nationals, as other nationals controlling foreign sources of supply have adopted policies that discriminate against, hinder, and even prevent our nationals entering foreign fields.
- (4) The encouragement of and effective assistance to our nationals in developing foreign fields is essential to securing the oil needed.
- (5) Commercial control by our nationals over large foreign sources of supply will be essential if the estimated requirements are to be assured.
- (6) It is necessary that all countries be induced to abandon or adequately modify present discriminatory policies and that the interest of our nationals be protected.
- (7) Some form of world-wide oil-producing, purchasing, and marketing agency fostered by this Government seems essential to assure the commercial control over sufficient resources to meet the competition of other nationals. England has apparently adopted such a policy.

This board proposed the following program of action:

(1) To secure the removal of all discriminations to the end that our nationals may enjoy in other countries all the privileges now enjoyed by other nationals in ours:

(a) By appropriate diplomatic and trade measures.

(b) By securing equal rights to our nationals in countries newly organized as mandatories.

(2) To encourage our nationals to acquire, develop, and market oil in foreign countries:

(a) By assured adequate protection of our citizens engaged in securing and developing foreign oil fields.

(b) By promotion of syndication of our nationals engaged in foreign business, in order to effectually conduct oil development and distribution of petroleum and its products abroad.

(3) Governmental action—through special agency or board:

(a) Through the organization of a subsidiary governmental corporation with power to produce, purchase, refine, transport, store, and market oil and oil products.

(b) Through the formation of a permanent petroleum administration.

(4) To assure to our nationals the exclusive opportunity to explore, develop, and market the oil resources of the Philippine Islands, provided discriminatory policies of other nations against our nationals are not abandoned or satisfactorily modified.

I have given much thought during the past year to this problem of adding to our petroleum supply, and it has seemed to me but fair that we should first make every effort to increase the domestic supply through the methods that have been indicated—

(1) The saving of that which is now wasted, below ground and above ground.

(2) The more intensive use, through new machinery and devices, of the supply which we have.

(3) The development of oil fields on our withdrawn territory and in new areas such as the Philippines.

In addition, we must look abroad for a supplemental supply, and this may be secured through American enterprise if we do these things:

(1) Assure American capital that if it goes into a foreign country and secures the right to drill for oil on a legal and fair basis (all of which must be shown to the State Department) that it will be protected against confiscation or discrimination. This should be a known, published policy.

(2) Require every American corporation producing oil in a foreign country to take out a Federal charter for such enterprise under which whatever oil it produces should be subject to a preferential right on the part of this Government to take all of its supply or a percentage thereof at any time on payment of the market price.

(3) Sell no oil to a vessel carrying a charter from any foreign government either at an American port or at any American bunker

when that government does not sell oil at a nondiscriminatory price to our vessels at its bunkers or ports.

The oil industry is more distinctively American than any other of the great basic industries. It has been the creation of no one class or group but of many men of many kinds—the hardy, keen-eyed prospector with a “nose for oil” who spent his months upon the deserts and in the mountains searching for seepages and tracing them to their source; the rough and two-fisted driller, a man generally of unusual physical strength, who handled the great tools of his trade; the venturesome “wildcatter,” part prospector, part promoter, part operator, the “marine” of the industry, “soldier and sailor too”; the geologist who through his study of the anatomy of the earth crust could map the pools and sands almost as if he saw them; the inventor; the chemist with still and furnace; the genius who found that oil would run in a pipe—these and many more, in most of the sciences and in nearly all of the crafts, have created this American industry. If they are permitted they will reveal the world supply of oil. And upon that supply the industries of our country will come to be increasingly dependent year by year.

BY WAY OF SUMMARY.

It would seem to be our plain duty to discover how little coal we need to use. To do this we must dignify coal by grading it in terms not merely of convenience as to size, but in terms of service as to its power. We should save it, if for no better reason than that we may sell it to a coal-hungry world. We should develop water power as an inexhaustible substitute for coal and if necessary compel the coordination of all power plants which serve a common territory. New petroleum supplies have become a national necessity, so quickly have we adapted ourselves to this new fuel and so extravagantly have we given ourselves over to its adaptability. To save that we may use abundantly, to develop that we may never be weak, to bring together into greater effectiveness all power possibilities—these would seem to be national duties, dictated by a large self-interest.

I have gone only sufficiently far into this whole question to realize that it is as fundamental and of as deep public concern as the railroad question and that it is even more complex. No one, so far as I can learn, has mastered all of its various phases; in fact, there are few who know even one sector of the great battle front of power. A Foch is needed, one in whom would center a knowledge of all the activities and the inactivities of these three great industries, which in reality are but a single industry. We should know more than we do, far more about the ways and means by which our unequalled wealth in all three divisions can be used and made interdependent, and the moral and the legal strength of the Nation should be behind a studied, fact-based, long-viewed plan to make America the

home of the cheapest and the most abundant and the most immediately and intimately serviceable power supply in the world. If we do this, we can release labor and lighten nearly every task. We will not need to send the call to other countries for men, and we can distribute our industries in parts of the country where labor is less abundant and where homes will take the place of tenements. One could expand upon the benefits that would come to this land if a rounded program such as has been but skeletonized here could be carried out. I am convinced that within a generation it will be effected, because it will be necessary.

The simple steps now obviously needed are to pass those primary bills which are already before Congress or are here suggested. But beyond this there is imperative need that some one man (an assistant secretary in this department would serve)—some one man with a competent staff and commanding all the resources of this and other departments of the Government shall be given the task of taking a world view as well as a national view of this whole involved and growing problem, that he may recommend policies and induce activities and promote cooperative relationships which will effect the most economical production of light, heat, and power, which is more than the first among the immediate practical problems of science, as Sir William Crookes said, for it is foremost among the immediate practical problems of national and international statesmanship.

LAND DEVELOPMENT.

I wish now to ask consideration for another matter of home concern to which I gave attention in my last report and as to which the intervening year has strengthened and perhaps broadened my ideas—the development of our unused lands.

It was never more vital to the welfare of our people that a creative and out-reaching plan of developing and utilizing our natural resources should go bravely forward than it is to-day. Ours is a growing country, and as its social and industrial superstructure expands its agricultural foundation must be broadened in proportion. The normal growth of the United States now requires an addition of 6,300,000 acres to its cultivable area each year, which means an average increase of 17,000 acres a day.

Fortunately, the opportunity for this essential expansion exists not only in the West, where much of the public domain is yet unoccupied, but in every part of the Republic. We have a great fund of natural resources in the very oldest States, from Maine to Louisiana, which invite and would richly reward the constructive genius of the Nation. It is claimed by those who have specialized for years on the subject of reclamation that the control and utilization of flood waters now wasted would produce within the next 10 years more

wealth than the entire cost to the United States of the war with Germany.

After every other war in our history the work of internal development has gone forward by leaps and bounds, and our people have thus quickly made good the economic wastes of the conflict. The needs of to-day are different from those of the past and require different treatment, but they are by no means beyond the reach of enlightened thought and action.

More than a year ago we began an earnest discussion of reconstruction policies, particularly with respect to the land. But nothing has been done. Not one line of legislation, not one dollar of money has been provided except in the way of preliminary investigation. We stand voiceless in the presence of opportunity and idle in the face of urgent national need.

A PROGRAM OF PROGRESS.

The great work of material development accomplished in the past has been done very largely by private capital and enterprise. Doubtless this must be the chief reliance for progress in the future. We should realize, however, that this method has involved losses as well as gains, for the Nation has sometimes been too prodigal in offering its natural resources as an inducement to private effort. Not only so, but with the exhaustion of the free public lands in our great central valleys—the most remarkable natural heritage that ever fell into the lap of a young nation—conditions of home making and settlement have radically changed.

There can be no doubt that there is an important sphere of action which the Government must occupy if we are to go steadily forward with the work of continental conquest, and all it implies to the future of the Nation, but in suggesting practicable steps of progress at this time I do not forget the burden of taxation which confronts our people nor the delicate and difficult task which Congress is called upon to perform in trying to keep the national outgo within the national income. Hence, I am now suggesting such constructive things as the Government may be able to do through the exercise of its powers of supervision and direction and with the smallest possible outlay of money.

Under this head I put, first, the matter of suburban homes for wage earners; second, reclamation of desert, overflow, and cut-over areas, together with improvement of abandoned farms, under a system of district organization which may be made to finance itself; third, cooperation with various States in the work of internal development.

GARDEN HOMES FOR THE PEOPLE.

There is no more baffling problem than that presented by the continued growth of great cities, but it is a problem with which we must

sometime deal. It bears directly on the high cost of living and is, indeed, largely responsible for it. Rent is based on land values. Land values rise with increasing population. The price of food is closely related to the growing disproportion between consumers and producers, resulting from urban congestion.

Here is Washington, a city of some 400,000 people, doubtless destined steadily to grow until—a Member of Congress predicts—it may touch 2,000,000 twenty years hence. Already the housing problem is acute, as it is in almost every other large American city. It would be a pitiful thing if the provision of more housing facilities to meet the needs of growing population meant merely more congestion and higher rents, with an ever-decreasing degree of landed proprietorship and true individual independence. Such conditions, it seems to me, undermine the American hearthstone and carry a deep menace to the future of our institutions. I believe there must be a better way, and that the time has come when we should make an earnest effort to find it.

Within a 10-mile circle drawn around the Capitol dome are thousands of acres of good agricultural land, of which the merest fraction has been reduced to intensive cultivation. Much of it is wastefully used, and much of it is not used at all. Conditions of soil, climate, and water supply are good and represent a fair average for the United States. Suburban transportation is a serious problem in some localities and less so in others, but tends to become more simple with the extension of good roads and increasing use of motor vehicles, including the auto bus.

Somewhere and sometime, it seems to me, a new system must be devised to disperse the people of great cities on the vacant lands surrounding them, to give the masses a real hold upon the soil, and to replace the apartment house with the home in a garden. Such a system should enable the ambitious and thrifty family not only to save the entire cost of rent, but possibly half the cost of food, while at the same time enhancing its standard of living socially and spiritually, as well as economically.

It has been suggested that there is no better place to demonstrate a new form of suburban life than here at the National Capital, where we may freely draw upon all the resources of the governmental departments for expert knowledge and advice and where the demonstration can readily command wide publicity and come under the observation of the Nation's lawmakers. And I am expecting that this experiment will be made. Such a plan of town or community life, rather than city life, should be extended to every other large city in the Nation. A simple act of legislation, accompanied by a moderate appropriation for organization and educational work, would enable the department to put its facilities at the service of local communities and of the industries throughout the United

States. This form of national leadership would be of value both to investors in the local securities and to the home builders themselves. If the work of land acquisition and construction, together with the organization of community settlements resulting therefrom, were conducted under the supervision of the State or the Federal Government it would safeguard the character of the movement from every point of view.

Therefore, I put first among the constructive things which may be done by the exercise of the Government's power of supervision and direction, with the smallest outlay of money, this matter of providing suburban homes for our millions of wage earners.

RECLAMATION BY DISTRICT ORGANIZATION.

The provision of garden homes for millions of city workers will contribute largely to the Nation's food supply and become in time a most effective influence in reducing excessive cost of living for many of our people. It will not, of course, solve the problem of increasing the number of farms and the area of cultivation to meet the needs of growing population. Neither will it enable us to expand our home market rapidly and largely enough to keep the country on an even keel of prosperity.

We must go forward with the development of natural resources as we have done for the past three centuries. And we must recognize at the outset that conditions have changed with the depletion of the public domain to the point where it offers comparatively little in the way of cultivable lands.

We have now to deal principally with lands in private ownership. This calls for a new point of view and for the application of a somewhat different principle than that which has governed our reclamation policy heretofore. Moreover, reclamation is no longer an affair of one section of the United States. The day has come when it must be nationalized and extended to all parts of the Republic.

To the deserts of the West we have brought the creative touch of water, and we must find a way to go on with this work. But it is of equal importance that we should liberate rich areas now held in bondage by the swamp, convert millions of acres of idle cut-over lands to profitable use, and raise from the dead the once vigorous agricultural life of our abandoned farms.

One more fundamental consideration—we have outlived our day of small things. Whether we would or not, we are compelled by the inexorable law of necessity arising out of existing physical conditions to cooperate, to work together, and to employ large-scale operations, and on this principle we should move: Not what the Government can do for the people, but what the people can do for themselves under the intelligent and kindly leadership of the Government.

We have an instrument at hand in the Reclamation Service which has dealt with every phase of the problem which now confronts us, and with such high average success as to command the entire confidence of Congress and the country. It has turned rivers out of their natural beds, reared the highest dams in existence, transported water long distances by every form of canal, conduit, and tunnel, installed electric power plants, cleared land, provided drainage systems, constructed highways and even railroads, platted townsites, and erected buildings of various sorts. In this experience, obtained under a variety of physical and climatic conditions, it has developed a body of trained men equal to any constructive task which may be assigned to it in connection with reclamation and settlement in any part of the country.

True economic reclamation is a process of converting liabilities into assets—of transforming dormant natural resources into agencies of living production. When such a process is intelligently applied it should be able to pay its own bills without placing fresh burdens on the national treasury. It is in the confident belief that such is actually the case that I suggest the policy of reclamation by means of local districts, financed on the basis of their own credit but with the fullest measure of encouragement and moral support of the Government, practically expressed through the Reclamation Service.

In this connection it seems worth while to recall that with a net expenditure of \$119,000,000 the Reclamation Service has created taxable values of \$500,000,000 in the States where it has operated. The ratio is better than three to one, and that is a wider margin of security than is usually demanded by the most conservative banking methods. There is no reason to doubt that the overflow lands of the South, the cut-over areas of the Northwest, and the abandoned farm districts of New England and New York and other States would do quite as well as the deserts of the West if handled by such an organization.

What is the legitimate function of the Government in connection with reclamation districts to be financed entirely upon their own credits without the aid of national appropriations? I should say that the Government, with great advantage to the investor, the land-owner, the future settler, and the general public, might do these things:

1. Employ its trained, experienced engineers, attorneys, and economists in making a thorough investigation of all the factors involved in a given situation, to be followed by a thorough official report upon the district proposed to be formed.

2. Offer the district securities for public subscription in the open market. This, of course, would follow the actual organization of the

district and the approval of its proceedings by the Government's legal experts.

3. Construct the works of reclamation with proceeds of district bond sales, and administer the system until it becomes a "going concern," when it may be safely confided to its local officers.

The most obvious advantage of Government cooperation is the fact that it would assure the service of a body of engineers, builders, and administrators trained in the actual work of reclamation. This advantage, as compared with the management that might be had in a sparsely settled local district, would often make all the difference between success and failure. Unquestionably it would materially reduce the interest rate on district bonds and greatly facilitate their sale in the open market.

There are other advantages less obvious but really more important. Experience has shown that great enterprises can best be handled under centralized control. This control, to be effective, must extend from the initiation to the completion of the project. There can be no assurance of this when the management is left to the electorate of a local district, and without such assurance it is difficult to command the support, first, of the landowners whose consent is essential to the formation of the district; next, of the investors who must supply the money; finally, of the settlers who must purchase and develop the land in order that the object of the enterprise may be realized. The Government can give the assurance of precisely that quality of unified, centralized, permanent, and responsible control that is required to command the confidence of all the factors in the situation.

There is another advantage of Government cooperation that will inure greatly to the benefit of the settler. The Government may readily apply the policy it now uses in connection with privately owned lands within reclamation projects. It requires the owners to enter into a contract by which they agree to accept a certain maximum price for their land if sold within a given period of years. This price is based upon the value of the land before reclamation. There are many instances, particularly of swamp and cut-over areas, where land that may be bought for \$10 an acre and reclaimed at a cost of \$25 to \$50 per acre, has an actual market value of \$100 to \$200 per acre the moment it is put into shape for cultivation. If the Government, by means of a contract with the local district, undertakes the work of reclamation and settlement and does this work at actual cost, the settler will generally save enough to pay for all his improvements and equipment.

The crowning consideration is the fact that, because of all these advantages, the work of reclamation would actually be accomplished, while to-day it is not being done except in the far West, and accomplished without the aid of Government appropriations.

SOLDIER-SETTLEMENT LEGISLATION.

In the foregoing, attention has been called to those things which may be accomplished by the exercise of the Government's powers of supervision and direction with the smallest outlay of money. In all this I have been speaking of reclamation for the sake of reclamation.

The proposed soldier-settlement legislation stands on an entirely different footing. The primary object is not to reclaim land but to reward our returned soldiers with the opportunity to obtain employment and larger interest in the proprietorship of the country. The policy is based on a sense of gratitude for heroic service, not on economic considerations. This is the answer to those who have criticized it as class legislation or the proposal to grant special privileges to one element of our citizenship or as a plunge into socialism. Frankly, we avow our purpose to do for the soldier what we would not think of doing for anybody else and what would not be justified solely as a matter of reclamation.

Many measures of soldier legislation have been introduced into Congress. Only one of these has been favorably reported. This was introduced by Representative Mondell, of Wyoming, on the first day of the present special session, embodying the plan of reclamation and community settlement brought forward by this department in the spring of 1918.

The measure has been much misunderstood and sometimes deliberately misrepresented. In the first place, it was not put forward as the complete solution of the soldier problem. It was at no time supposed or expected that all of the 4,800,000 men and women engaged in the war with Germany would or could take advantage of its provisions. It fortunately happens that the vast majority quickly found their places in the national life. Of the remainder, a very large proportion may be classified as "city minded." They have no taste for farm life but would be better served by vocational training and opportunities to enter upon remunerative trades or professions. There is an element of "country minded," and of these some 150,000 have made application for opportunities of employment and home-making under the terms of this bill. Largely they are men who have had agricultural experience but who can not obtain farms of their own without very considerable cash advances and other assistance which the Government could render. It is for this element that the policy is designed.

It has often been said that the plan would be applied only in the West and South. The truth is that it has been the purpose from the first to extend it to every State where feasible projects

could be found, and that our preliminary investigations lead us to believe this will include every State in the Union.

The wide discussion of the measure has been highly educational to the country, and some of the criticism is of constructive character. For example, attention has been sharply called to the fact that in certain localities there are individual farms well suited to our purpose which may often be had at a price representing rather less than the value of their improvements. These are the so-called "abandoned farms" so numerous in the Northeastern States. In some cases they are interspersed with land now cultivated, so situated that it is not possible to bring together a large number of contiguous farms as the basis of a Government project.

In New England and elsewhere public sentiment strongly favors a modification of the pending measure which will enable the purchase of individual farms rather than community settlement. This would be practicable only in localities where a sufficient number of farms, even if not contiguous, could be had to make possible the necessary supervision and instruction, together with cooperative organization for the purchase of supplies and sale of products. Without these advantages the plan of soldier settlement would fail in many instances. My information is that these conditions could be met. Not only so, but it is urged that existing farm communities would be inspired by the presence of soldier settlers and benefited by the presence of soldier settlers by their cooperative buying and selling agencies.

Another criticism of the pending measure is directed to the amount of the first payment the soldier settler is required to make. As the bill now stands it calls for 5 per cent on the land, 25 per cent on improvements and live stock, and 40 per cent on implements and other equipment. It has been urged by some friends of soldier settlement that no first payment should be required, but that the Government should make advances of 100 per cent in view of the soldiers' peculiar claim upon national consideration. It might be feasible to do this in the case of community settlements. But it could not be done in the case of scattered and individual farms, at least without abandoning the principles of sound business.

In the case of community settlement the soldier literally "gets in on the ground floor." Starting with a territory that is entirely blank so far as homes and improvements are concerned, he finds himself in a place where community values remain to be created. When he buys an improved farm in a settled neighborhood the situation is precisely reversed. In both cases there is or will be "unearned increment," or society-created values; but in the one case he *gets* the increment, while in the other case he *pays* it. Obviously, a larger advance would be justified in one case than in the other.

ALASKA.

One of the first recommendations made by me in my report of seven years ago was that the Government build a railroad from Seward to Fairbanks in Alaska. Five years ago you intrusted to me the direction of this work. The road is now more than two-thirds built, and Congress at this session, after exhaustively examining into the work, has authorized an additional appropriation sufficient for its completion. The showing made before Congress was that the road had been built without graft: every dollar has gone into actual work or material. It has been built without giving profits to any large contractors, for it has been constructed entirely by small contractors or by day's labor. It has been built without touch of politics: every man on the road has been chosen exclusively for ability and experience. It has been well and solidly built as a permanent road, not an exploiting road. It has been built for as little money as private parties could have built it, as all competent independent engineers who have seen the road advise.

Edwin F. Wendt, of the Interstate Commerce Commission, in charge of valuation of the railroads of the United States from Pittsburgh to Boston, after an investigation into the manner in which the Alaskan Railroad was constructed and its cost, reported to me as follows:

In concluding, it is not amiss to again state that after the full study which was given to the property during our trip, we are satisfied that the project is being executed rapidly and efficiently by men of experience and ability. It is believed that it is being handled as cheaply as private contractors could handle it under the circumstances.

The road has not been built as soon as expected because each year we have exhausted our appropriation before the work contemplated had been done. We could not say in October of one year what the cost of anything a year or more later would be, and we ran out of money earlier than anticipated. It has not been built as cheaply as expected because it has been built on a rising market for everything that went into its construction—from labor, lumber, food supplies, machinery, and steel to rail and ocean transportation. I believe, however, it can safely be said that no other piece of Government construction or private construction done during the war will show a less percentage of increase over a cost that was estimated more than four years ago.

The men have been well housed and well fed. Their wages have been good and promptly paid; there has been but one strike, and that was four years ago and was settled by Department of Labor experts fixing the scale of wages. The men have had the benefit of a system of compensation for damages like that in the Reclamation Service and Panama Canal. They have had excellent hospital service, and our

camps and towns have been free of typhoid fever and malaria. That the men like the work is testified by the fact that hundreds who "came out" the past two years, attracted by the high wages of war industries, are now anxious to return to Alaska.

There has been but one setback in the construction, and that was the washing out of 12 miles of tracks along the Nenana River. This is a glacial stream which, when the snows melt, comes down at times with irresistible force. In this instance it abandoned its long accustomed way and cut into a new bed and through trees that had been standing for several generations, tearing out part of the track which had been laid.

The work of locating and constructing the road has been left in the hands of the engineers appointed by yourself. The only instruction which they received from me was that they should build the road as if they were working for a private concern, selecting the best men for the work irrespective of politics or pressure of any kind. As a result, we have a force that has been gathered from the construction camps of the western railroads, made up of men of experience and proved capacity. That they have done their work efficiently, honestly, and at reasonable cost is my belief.

It is not possible during the construction of a railroad to tell what it costs per mile because all the foundation work, the construction of bases from which to work, the equipment for construction, and much of the material is a charge which must be spread over the entire completed line. The best estimate that can be made to-day as to the newly constructed road is that it has cost between \$70,000 and \$80,000 per main-line mile, or between \$60,000 and \$70,000 per mile of track.

This cost per mile includes the building of the most difficult and expensive stretch of line along the entire route from Seward to Fairbanks—that running along Turnagain Arm, which is sheer rock rising precipitously from the sea for nearly 30 miles. There are miles of this road which have cost \$200,000 per mile. Even to blast a mule trail in one portion of this route cost \$25,000 a mile.

The only Government-built railroad—that across the Isthmus of Panama—cost \$221,052 per mile. The only two recently built railroads in the United States are (1) the Virginian, built by H. H. Rogers, which cost exclusive of equipment \$151,000 per mile, with labor at from \$1.35 to \$1.75 per day and all machinery, fuel, rails, and supplies at its door, and (2) the Milwaukee line to Puget Sound, which is estimated as having cost \$130,000 per mile exclusive of equipment.

The work has been conducted with its main base at Anchorage, which is at the head of Cook Inlet. The point was chosen as the nearest point from which to construct a railroad into the Matanuska

coal fields. That was the primary objective of the railroad, to get at the Matanuska coal. From Anchorage it was also intended to drive farther north through the Susitna Valley and across Broad Pass, and to the south along Turnagain Arm toward the Alaska Northern track. To secure coal for Alaska was the first need. So in addition to Anchorage as a base, one was also started at Nenana, on the Tanana River, from which to reach the Nenana coal fields lying to the south. If these two fields were open, one would supply the coast of Alaska and one the interior. This program has been acted upon, with the result that the Matanuska field is open to tidewater with a down-grade road all the way. The Nenana road has been pushed far enough south to touch a coal mine near the track, which may obviate the immediate necessity for reaching into the Nenana field proper.

There is an open stretch across Broad Pass to connect the Susitna Valley with the road coming down from Nenana. This gap closed, there will be through connection between Seward and Fairbanks.

MATANUSKA COAL.

By decisions of the Commissioner of the Land Office all of the claims in the Matanuska coal field were set aside, and by act of Congress a leasing bill was put into effect over the entire field. Under this law a number of claims must be reserved to the Government. The field was surveyed, and some of the most promising portions of the field have been so reserved.

Two leases have been entered into by the Government, one with Lars Netland, a miner, who has a backer, Mr. Fontana, a business man of San Francisco, and the other with Oliver La Duke and associates. There are many thousands of acres in this field which are open for lease and which will be leased to any responsible parties who will undertake their development. Government experts who have examined this field do not promise without further exploring a larger output of coal from this field than 150,000 tons a year.

The population of Alaska has fallen off during the war. She sent, I am told, 5,000 men into the Army, the largest proportion to population sent by any part of the United States. The high cost of labor and materials closed some of the gold mines, and the attractive wages offered by war industries drew labor from Alaska to the mainland. All prospecting practically closed. But with the return of peace there is evidence of a new movement toward that Territory which should be given added confidence in its future by the completion of the Alaskan Railroad. There is enough arable land in Alaska to maintain a population the equal of all those now living in Norway, Sweden, and Finland, and all that can be produced in those countries can be produced in Alaska. The great need is a market, and this will be found only as the mining and fishing industries of the country develop.

SAVE AND DEVELOP AMERICANS.

When the whole story is told of American achievement and the picture is painted of our material resources, we come back to the plain but all-significant fact that far beyond all our possessions in land and coal and waters and oil and industries is the American man. To him, to his spirit and to his character, to his skill and to his intelligence is due all the credit for the land in which we live. And that resource we are neglecting. He may be the best nurtured and the best clothed and the best housed of all men on this great globe. He may have more chances to become independent and even rich. He may have opportunities for schooling nowhere else afforded. He may have a freedom to speak and to worship and to exercise his judgment over the affairs of the Nation. And yet he is the most neglected of our resources because he does not know how rich he is, how rich beyond all other men he is. Not rich in money—I do not speak of that—but rich in the endowment of powers and possibilities no other man ever was given.

Twenty-five per cent of the 1,600,000 men between 21 and 31 years of age who were first drafted into our Army could not read nor write our language, and tens of thousands could not speak it nor understand it. To them the daily paper telling what Von Hindenberg was doing was a blur. To them the appeals of Hoover came by word of mouth, if at all. To them the messages of their commander in chief were as so much blank paper. To them the word of mother or sweetheart came filtering in through other eyes that had to read their letters.

Now this is wrong. There is something lacking in the sense of a society that would permit it in a land of public schools that assumes leadership in the world.

Here is raw material truly, of the most important kind and the greatest possibility for good as well as for ill.

Save! Save! Save! This has been the mandate for the past two years. It is a word with which this report is replete. But we have been talking of food and land and oil while the boys and young men that are about us who carry the fortune of the democracy in their hands are without a primary knowledge of our institutions, our history, our wars and what we have fought for, our men and what they have stood for, our country and what its place in the world is.

The marvelous force of public opinion and the rare absorbing quality of the American mind never was shown more clearly than by the fact that out of these men came a loyalty and a stern devotion to America when the day of test came. Had Germany known what we know now, it would have been beyond her to believe that America could draft an army to adventure into war in Europe. There should not be a man who was in our Army or our Navy who has the ambi-

tion for an education who should not be given that opportunity—indeed, induced to take it—not merely out of appreciation but out of the greater value to the Nation that he would be if the tools of life were put into his hand. There is no word to say upon this theme of Americanization that has not been said, and Congress, it is now hoped, will believe those figures which, when presented nearly two years ago, were flouted as untrue. The Nation is humiliated at its own indifference, and action must be the result.

To save and to develop, I have said, were equally the expression of a true conservation. What is true as to material things is true as to human beings. And once given a foundation of health there is no other course by which this policy may be effected than to place at the command of every one the means of acquiring knowledge. The whole people must turn in that direction. We should enable all, without distinction, to have that training for which they are fitted by their own natural endowment. Then we can draw out of hiding the talents that have been hidden. The school will yet come to be the first institution of our land, in acknowledged preeminence in the making of Americans who understand why they are Americans and why to be one is worth while.

Respectfully, yours,

FRANKLIN K. LANE,
Secretary.

The PRESIDENT.

ADMINISTRATIVE EFFORT.

THE GENERAL LAND OFFICE.

1. Allowed during the fiscal year original entries of Indian and public lands 11,871,181.50 acres, an increase of 1,896,849.89 acres over the area entered and allowed during the fiscal year 1918.
2. Patented during the fiscal year an area of 10,777,001.349 acres, an increase over the fiscal year of 1918 of 1,224,519.132 acres.
3. Collected from all sources during the year \$4,303,674.20, and expended during the same time in the public land service, \$3,026,554.46, leaving a net surplus of receipts over expenditures of \$1,277,119.74.
4. Collected and turned into the United States Treasury as the result of the work of the field service, \$101,298.96.
5. Restored to the public domain as the result of investigation in the field, 164,363.83 acres.
6. Secured as escrow deposits, under contracts entered into with oil-land claimants under the act of August 25, 1914 (38 Stat., 708), up to the end of the fiscal year, \$4,325,005.84.
7. Secured as escrow deposits by operators under oil-land leases from the State of Wyoming, \$2,119,306.58.

8. Obtained judicial decree quieting title in the United States to 617 acres of oil-producing lands in the State of Louisiana, with an award of \$462,903.39 for oil taken in trespass.

9. Obtained a judicial decree quieting title in the United States to 54,000 acres of Arkansas "Sunk lands," of the value of \$2,700,000.

10. Approved and accepted surveys and resurveys covering an area of 7,668,514 acres.

11. Approved for patent 40,131 homestead and kindred entries, as against 32,120 the year previous.

12. Allowed 15,037 stock-raising homestead entries covering an area of 5,559,235 acres.

13. Secured the withdrawal for stock driveway purposes, under the grazing homestead act, 4,303,727 acres. The total area thus withdrawn at present is 6,623,531 acres.

14. Promulgated administrative ruling of June 13, 1919, discontinuing the application of the rule of approximation in the location of soldiers' additional homestead rights.

15. Received from the sale of town lots outside of Alaska, \$112,871.30.

16. Received from the sale of town lots in Alaska, \$31,474.91.

17. Patented under the Carey Act, 85,699 acres.

18. Patented 1,675 desert-land entries, embracing 267,065 acres.

19. Patented 653 final reclamation homestead entries.

20. Certified under State grants as school indemnity, and for other purposes, 1,628,834 acres.

21. Eliminated from national forests 21,267 acres of school-section lands by exchange for other lands through cooperative agreements with the grantee States.

22. Secured an agreement with the State of Washington for the institution of legal proceedings by which a decision may be obtained as to the applicability of the provisions of the act of February 28, 1891 (26 Stat., 796), to the school grant of the State; action on 85,000 acres of selections remaining suspended in the meantime.

23. Patented under railroad grants 632,284 acres.

24. Completed the classification of the revested lands embraced in the former grant to the Oregon & California Railroad Co. so far as susceptible of such action at the present time.

25. Surveyed 182,000 acres of land embraced in the Oregon and California grant as a prerequisite to the adjustment thereof under the act of revestment.

26. Sold the timber on 2,875 acres of revested Oregon and California grant lands for the sum of \$96,497.83.

27. Received proposals for the exchange under the act of May 31, 1918, of approximately 80,000 acres of revested Oregon and California lands.

28. Issued 3,207 patents in fee to Indians for a total acreage of 410,529 acres.

29. Approved for patent under the Minnesota drainage act 1,118 entries, covering an area of 176,320 acres as against 146,240 acres the year previous. A total area of 766,920 acres has been patented under this act.

30. Approved for patent mineral entries covering 32,559.77 acres, for which \$137,381.09 was received, and coal entries for 7,843.17 acres, for which \$295,031.75 was received.

31. Secured a coal-land lease in the Bering River field for 2,080 acres, making a total of 4,500 acres under lease in that field, with 2,840 acres under lease in the Matanuska field.

32. Decided 10,017 litigated cases aside from mineral contests.

33. Investigated in the field and reported on 17,399 cases.

34. Obtained 14 convictions in criminal cases prosecuted during the year.

35. Received during the year 200 applications for permits to prospect for potash.

THE INDIAN OFFICE.

1. Under the "Declaration of Policy," of April, 1917, issued 10,956 fee patents, or 1,062 more than in the 10 years preceding, 4,376 of which were within the last year; broadened the policy to include those of one-half Indian blood. Instituted special measures for the rapid settlement of about 20,000 inherited estates.

2. Cites information showing that Indian soldiers gained great benefit from war service in white organizations and won distinction for individual valor.

3. Maintained efficiency in Indian schools under depletion of service caused by the war. Emphasized the policy of enrolling Indian children in public schools and requiring well-to-do parents and citizen Indians to pay the expense of their children's education, and amended school regulations with a view to reserving Government schools for Indians not well provided with such facilities.

4. Kept all health conditions among the Indians as nearly normal as was possible in view of extreme shortage of physicians and nurses requisitioned by the war, and combated in the main successfully the epidemic of Spanish influenza. Formulated plans for aggressive health work during the coming year, and will emphasize the prevention of disease through better housing, better water supplies, better bodily nutrition, and the practice of hygiene, sanitation, and well-ordered living.

5. Instituted during the year 1,516 new cases against illicit liquor traffic and disposed of 2,135. Seized and destroyed 33,924 gallons of intoxicants; libeled and sold 112 automobiles engaged in illegal traffic; and conducted prosecutions for violations of State, Federal, and municipal laws in 27 different States.

6. Continued farming, gardening, and stock raising among the Indians on a war-time basis of production, and secured greater use of agricultural machinery and improved methods of tillage. Stimulated high-grade cotton culture, improvement of stock breeds, and completed the eradication of contagious diseases among stock on several reservations in the Northwest.

7. Overcame high cost of all material, and the scarcity of labor in irrigation construction by greater use of mechanical appliances, such as dredges, excavators, and ditch cleaners. Extended irrigated areas in the Northwest, where the Yakima project, Washington, returned last year a value of \$9,000,000 in crops; installed additional wells to supply drinking water for live stock on the arid Indian lands of Arizona and New Mexico, and increased the sewerage and domestic water supply of some of the Indian pueblos.

8. Made 1,213 allotments to Indians of irrigable and nonirrigable land on the reservations, about 1,000 reallocations, under provision of law, and 315 allotments comprising 46,207 acres on the public domain. Sold 115,367 acres of Indian land for the highest average price ever received, \$25.65 per acre. Continued the leasing of surplus Indian lands with excellent results in the increase of general farm products.

9. Disbursed to individual Indians of the Five Civilized Tribes from land sales, equalization, royalties and per capita payments \$7,812,331.44, and supplied them houses, barns, improvements, and miscellaneous articles in the value of \$1,110,618.53. Sent a competency commission to the Creek Tribe to determine such as are capable of controlling their allotted land, and removed restrictions from 57,000 acres. To June 30, 1919, tribal land of the Five Civilized Tribes had been sold for \$20,376,096.27 and their unsold tribal property was worth approximately \$18,000,000. These nations made substantial gains in agriculture and stock raising during the year.

10. Sold 1,700,000,000 feet of timber from reservation forests; cut 30,000,000 feet under contract on the Red Lake Reservation, and extended the construction of roads and bridges on the reservations, largely through Indian labor.

11. The office probate work included appearance by attorneys in more than 7,000 regular cases, the final disposition of about 2,700 cases besides action on a large number of wills and some 3,000 miscellaneous matters.

12. Osage oil and gas leases were consummated for a consideration of \$11,473,820, in addition to royalties. The year's gross production of oil for this tribe numbered 12,138,086 barrels, and their revenue from oil and gas was approximately \$17,000,000. The restricted land of the Five Civilized Tribes yielded in the year 10,180,862 barrels of oil and \$4,073,985 from oil and gas. Other reservations in Oklahoma and farther west added extensive mineral returns to the foregoing.

13. Forty per cent of reimbursable funds loaned to Indians has been repaid and the remaining installments are well secured. Tribal herds purchased from such funds have been profitable.

14. The disbursement of individual funds to adult and minor Indians is proceeding with a liberal view to the emancipation of the Indian from Government control.

15. Active work is in progress in behalf of the Seminoles of Florida, the Alabama Indians in Texas, and the homeless bands of California.

16. The bureau is assisting the Department of Justice in important litigation now before the Supreme Court of the District of Columbia involving the title to practically all of the land within the present Papago Reservation.

THE BUREAU OF PENSIONS.

1. Paid for pensions, \$222,159,292.

2. Returned to the Treasury \$947,170.97 of the amount appropriated for the payment of pensions.

3. Returned to the Treasury \$118,419.86 of the sum appropriated for the maintenance and expense of the pension system, including salaries of special examiners.

4. Reduced the number of employees by 58.

5. Under the act of July 16, 1918, providing pensions to widows and minor children of officers and enlisted men who served in the War with Spain, Philippine insurrection, or in China, pensions have been granted to 992 widows, 72 minor children, and 1 helpless child. There are a number of claims still pending under this act.

6. Receipts for addresses, certified copies, etc. (act Aug. 24, 1912), \$2,153.70. Refundments to pension appropriations, \$6,890.05. Miscellaneous receipts, \$3,041.15.

THE PATENT OFFICE.

Granted—Patents on mechanical inventions.....	37, 259
Granted—Reissue patents.....	205
Granted—Design patents.....	1, 355
Registered—Trade-marks.....	3, 766
Registered—Labels.....	572
Registered—Prints.....	196
Total.....	43, 353
Sold—Copies of patents.....	2, 163, 057
Shipped to foreign countries—Copies of patents.....	991, 976
Copies of printed office records certified to.....	6, 616
Recorded—Assignments.....	29, 973
Number of words furnished by making photostat copies of office records.....	9, 196, 900
Number of typewritten words furnished as copies of office records.....	18, 253, 700

Number of applications filed for—

Inventions	62, 755
Designs	2, 787
Reissues	226
Trade-marks	8, 561
Labels	934
Prints	394
Total	75, 657
Number of applications allowed	51, 707
Number of amendments filed	143, 778
Number of appeals on merits	1, 914
Number of petitions to commissioner	3, 575
Number of notices of opposition	144
Number of interferences declared	1, 264
Number of interferences disposed of	1, 210
Number of letters constituting miscellaneous correspondence received, answered, and indexed	250, 262
Number of photostat copies of foreign patents furnished	107, 496
Number of photographic copies furnished	56, 307
Number of photostat copies furnished other departments without charge	5, 062
Number of photostat copies made for use in the Patent Office	22, 389

THE BUREAU OF EDUCATION.

1. Promoted the education of foreign-born residents through classes in schools and industrial plants, urged State legislative action for the education of immigrants, conducted conferences on Americanization, prepared articles on Americanization for papers having a circulation of 5,000,000 and assisted in organizing societies for the promotion of Americanization work.

2. Promoted the establishment of courses in community organization in colleges and universities, developed regular communication with 1,000 community organizations, and in cooperation with the Post Office Department arranged an experiment for cooperative buying and selling at schoolhouses as community centers.

3. Enrolled over 2,000,000 school children in 2,529 cities of the United States in school-directed home gardening. The total value of the product of the gardens approximated \$48,000,000.

4. Assisted the Committee on Education and Special Training in the formation of plans for training mechanics and technicians for the Army in civilian institutions and in establishing a Students' Army Training Corps.

5. Made a survey of 15 major cities and 250 smaller cities to ascertain their needs for commercial education with special reference to foreign-trade training.

6. In the School Board Service Division registered 20,000 high-grade teachers and made 15,000 nominations for positions.

7. Cooperated with the overseas educational commission of the Y. M. C. A. in preparing a course in citizenship for soldiers overseas.

8. Provided for State and local information on negro education, cooperated with the Y. M. C. A. in work among negro soldiers in France and advised with the Committee on Education and Special Training on the training of negro soldiers.

9. With the cooperation of the Child Health Organization published and distributed a series of health education bulletins and secured their widespread use in many cities and States.

10. In educational extension work distributed Federal documents, war courses, and package libraries.

11. Collected 6,000,000 feet of motion-picture film and deposited 4,000,000 feet of it with the extension divisions of universities.

12. With the cooperation of the governor of Alaska helped to check the spread of influenza and to relieve the suffering among the natives.

13. Made and completed, at the request of State and local school authorities, six educational surveys.

14. Secured data for a thorough and complete report of rural school consolidation in the country at large and in certain typical counties.

15. Held four important national and sectional conferences on rural education.

16. Held four conferences on plans for the improvement of schools in villages and small towns.

17. Undertook to work out with the cooperation with the Erlanger Mill Corporation a model system of schools for a cotton-mill village.

18. Held a conference of superintendents of city schools for the purpose of working out an adaptation of the school program to fit the industrial needs of older pupils during the war.

19. Held five conferences in Washington and three in other cities of the United States on various phases of industrial education and home making.

20. Conducted an intensive campaign for the establishment of kindergartens in Texas.

21. Distributed a leaflet on the use of the kindergarten in furthering the work of Americanization.

22. Collected statistics for the biennial survey of education throughout the United States for the biennial period 1916-1918.

23. Initiated and partly secured the adoption of a plan for securing from State departments of education educational statistics, collected by uniform methods throughout the United States.

24. Printed and circulated 1,505,448 copies of bulletins, reports, and other documents and 1,396,518 copies of circulars and duplicated letters.

25. Prepared and issued 93 educational bulletins and published the magazines "School Life," "Americanization," "National School Service," and "National Library Service."

26. Conducted an extensive correspondence on educational matters. In all 227,958 letters were received, an increase of 65,479 over 1918.

27. Prepared 100 new educational bibliographies and issued a series of six library leaflets.

28. Prepared and distributed information upon college opportunities for returning soldiers.

29. Prepared and distributed to State legislatures a manual of educational legislation.

30. Made a comprehensive study of free public libraries as they affect the rural population of the country.

31. Prepared and distributed a series of after-war reading courses for returned soldiers and for those in cantonments.

THE GEOLOGICAL SURVEY.

1. Continued its war work on the country's metallic mineral resources, making a census and special studies of deposits of iron, manganese, tungsten, zirconium, molybdenum, and quicksilver, extending further its search for new deposits, and preparing a wall map showing the deposits of manganese ore in the United States.

2. Contributed reports on mercury, graphite, phosphate rock, manganese, antimony, tungsten, magnesite, emery, corundum, bauxite and aluminum, and platinum to a series of mimeographed pamphlets issued by the Interior Department, showing the commercial control of these commodities throughout the world.

3. Collected weekly statistics of the production of copper, lead, zinc, and aluminum, and furnished them to the Government purchasing agencies, and cooperated with the War Industries Board and the Shipping Board in preparing tables and diagrams showing the supplies of minerals available and the estimated requirements.

4. Cooperated with the Fuel Administration in collecting statistics of production and movement of coal and coke, and mapped and filed data for the use of the Fuel Administration and other branches of the Government.

5. Carried along still further its studies to discover how far water power might be used to replace coal in view of the stress and the difficulties in mining and marketing coal, and cooperated with the Fuel Administration in working out a comprehensive scheme of classification of coals and a zoning system applicable to the country's coal fields and coal industry, to insure economy and efficiency in mining and transportation.

6. Continued its work in oil and gas fields and its search, both at home and abroad, for potash and nitrates, minerals urgently needed in the prosecution of the war.

7. Made examinations and estimates of resources of natural gas and a special cooperative research for helium-rich gas for use in inflating war balloons.

8. Made further studies of porous rocks, to discover more buoyant material for making concrete ships, and made search for material adapted to use as smudges.

9. Made examinations of deposits of high-grade clays in the eastern part of the United States to determine their availability for making paper or for making articles of porcelain or articles for use in electrical equipment.

10. Compiled information on road-building material for use in connection with a military map of the country.

11. Made about 1,500 laboratory analyses and assays, among them tests of rocks for platinum, a metal much needed for military use, and special determinations of the potash content of certain rocks.

12. Prepared military maps and descriptions of the country around several camps and training stations.

13. Prepared for the use of the Shipping Board 82 topographic maps and 69 accompanying tracings showing military information, and a large wall map of the world.

14. Prepared for the War Department and for boards and bureaus engaged in the conduct of the war information concerning water supplies from springs and wells in different parts of the country, as well as maps and descriptions of water supplies along the international border and the Atlantic coast.

15. Gave information and advice to the War and Navy Departments in regard to water supply at about 100 military and naval establishments in the United States, such as cantonments, forts, navy yards, aviation fields, powder factories, arsenals, and supply depots.

16. Made examinations of underground water for many camps, cantonments, and military and naval stations.

17. Prepared maps and data showing the location and extent of mineral deposits in foreign countries, their quality and their output by districts and regions, and the distribution of minerals in the world's commerce.

18. Prepared chapters on mineral commodities and on economic conditions in Japan and Sweden for incorporation in a report compiled by the Bureau of Research of the War Trade Board.

19. Prepared for the Capital Issues Committee geologic and statistical information to aid in directing capital into the fields where it would be of greatest use during the war.

20. Prepared, in cooperation with the Central Bureau of Planning and Statistics, a voluminous index of the information in the possession of several Government organizations concerning mineral resources.

21. Made a geologic reconnoissance of the islands of St. Thomas, St. John, and St. Croix of the Virgin Islands at the request of the Acting Secretary of the Navy and of the governor and naval commandant of the islands, with particular studies of the ground-water resources.

22. Investigated ground-water resources of eastern Porto Rico in compliance with a request from the Navy Department and examined manganese deposits of the island.

23. Continued surveys in Alaska, examining especially deposits of chromite and tin, making investigations in the region now being developed by the Government railroad, and continuing measurements of stream flow.

24. Made topographic surveys of areas in Alaska aggregating about 1,200 miles and geologic surveys of areas aggregating 3,500 square miles.

25. Maintained during the entire year a branch office in Alaska to provide closer cooperation between the Geological Survey and the operators of the Government coal mines, to keep in touch with local developments, and to furnish aid to prospectors and miners by giving them publications and information.

26. Collected annual statistics of the mineral production of Alaska.

27. Mapped more than 10,000 square miles of territory in the United States, laid more than 4,000 linear miles of primary traverse and more than 4,000 linear miles of levels, and established more than 2,000 permanent bench marks, occupying 61 triangulation stations and permanently marking 50 stations.

28. Instructed about 100 enlisted men in topographic map drafting.

29. Continued investigations of stream flow by maintaining more than 1,200 gauging stations in 38 States and in Hawaii and Alaska.

30. Continued statistical studies of power resources and output and investigated, in cooperation with the United States Fuel Administration, problems relating to the operation of power plants, the interconnection of transmission systems, and the substitution of water power for fuel power.

31. Prepared reports on desert watering places under a plan for mapping and marking the watering places in the arid region east of the Sierra Nevada and the Cascade Range and west of a line running from eastern Oregon through Salt Lake City and Santa Fe to the mouth of Pecos River.

32. Classified 6,439 acres of public lands as to their content of coal, 3,703 acres as coal land, and 2,736 acres as noncoal land.

33. Recommended withdrawal of 2,415 acres of coal land and restoration to entry of 3,331,552 acres, the classification and appraisal of which had been completed.

34. Recommended withdrawal from entry of 239,946 acres of probable oil land and the restoration to entry of 931 acres to entry as non-oil land.

35. Classified 129,421 acres of lands as to their content of oil shale, of which 125,341 acres were classified as lands valuable as a source of petroleum and nitrogen and 4,080 acres were classified as non-mineral lands.

36. Recommended withdrawals and restorations of oil-shale lands resulting in a reduction of the total oil-shale reserves to 128,267 acres, practically all of it reserved for the use of the Navy.

37. Reduced the reserves of potash-bearing land by 440 acres, leaving 130,029 acres now reserved.

38. Cooperated with the General Land Office and the Indian Office in supplying information concerning the mineral or nonmineral value and the value as to water resources of lands for which applications have been filed, acting on 4,259 such requests.

39. Furnished the General Land Office reports on the feasibility of irrigation projects and proposed power developments representing 240 cases.

40. Recommended the designation of 8,452,637 acres of land as non-irrigable under the enlarged-homestead act and the cancellation of the designation of 5,254 acres that had been previously classed as non-irrigable on information that the lands are irrigable.

41. Recommended the withdrawal of 7,392 acres for power sites and the restoration of 6,037 acres, leaving the total now so reserved 2,565,727 acres.

42. Investigated both surface and ground waters in connection with the classification of public lands with special reference to their use for power under permit or for agriculture under the enlarged-homestead, desert-land, or Carey acts.

43. Disposed of 29,176 applications made for entry to land under the stock-raising homestead law.

44. Recommended addition to the public water reserves of 22,422 acres and the elimination from water reserves of 1,375 acres.

45. Continued work in its lithographic plant for bureaus, boards, and offices of the War Department, the Navy Department, and other branches of the Government, printing maps, charts, diagrams, and other work in editions aggregating several hundred thousand.

46. Engraved and printed 140 regular topographic maps of areas in the United States, and printed editions of 360 maps, amounting to 945,000 copies.

47. Performed contract and miscellaneous work involving the printing of 2,935,543 copies, the total copies of all work printed amounting to 3,884,849.

48. Photolithographed and printed 30 new topographic war maps and compiled and printed 9 special maps of Army camps and cantonments, on the backs of which special descriptive texts were printed.

49. Published 147 reports containing 11,644 pages.

50. Supplied through Members of Congress from their legal quota 2,163 schools with sets of maps showing the various types of country in the United States for use in teaching geography and physiography.

51. Distributed 465,826 books, 8,865 folios, and 538,396 maps.

THE RECLAMATION SERVICE.

1. Continued the construction and operation of irrigation works capable of furnishing water to 1,602,000 acres of arid land and actually irrigated in 1918 nearly 1,120,000 acres, covered by project statistics, producing crops valued at over \$66,000,000.

2. Increased the area irrigated and covered by crop census 93,000 acres over that of the previous year.

3. Operated irrigation works including 40 reservoirs, several power and pumping plants, over 12,000 miles of canals and drains, as well as pipe lines, flumes, and tunnels and thousands of structures, such as dams, headgates, weirs, checks, drops, etc.

4. Continued the extension of the projects, including the construction of 396 miles of canals, 179 miles of drains, and nearly 8,000 canal structures, and excavated 14,000,000 cubic yards of earth and rock.

5. Continued the standardization of the numerous irrigation structures in the interest of economy and the efficient operation of the projects.

6. Continued the policy of stimulating crop production by expending construction funds where they would most quickly increase the productive area of the projects, by active cooperation with the farmers in leveling and otherwise preparing their lands for cultivation, by temporary leasing of withdrawn lands not yet ready for irrigation for dry farming and grazing purposes, by disposal of stored water to lands outside of the projects whenever it would result in increased production and would not jeopardize the project supply, and by encouraging better storage and marketing facilities.

7. Cooperated with other departments of the Government, with other bureaus of the Interior Department, with State governments, and with numerous local project organizations in the furtherance of reclamation work and the interests of the water users.

8. Carried on a survey of soldier-settlement possibilities throughout the United States resulting in the location of probably feasible projects in practically every State, ranging in area from 5,000 acres to over 200,000 acres.

THE BUREAU OF MINES.

Cooperated with various departments and bureaus of the Government in work relating to the war.

1. In cooperation with the War and Navy Departments continued work on a plant for recovering helium, a rare, noninflammable gas for balloons and airships from natural gas, and demonstrated the merits of the process used.

2. Completed the construction, in cooperation with the War Department, of a plant for manufacturing sodium cyanide by the Bucher process.

3. Investigated mining and milling problems at mineral deposits throughout the country in order to ascertain the available supply of war minerals, and how these minerals could be produced more efficiently.

4. Issued reports showing the markets for various ores, minerals, and metals, and giving data on the status of various mineral industries.

5. Made a thorough study of the manufacture of sulphuric acid in the United States.

6. As a result of an examination of methods of purifying crude graphite, developed improvements in milling practice.

7. Determined the possibility of substituting domestic for imported graphite in the manufacture of crucibles.

8. Made further advances in methods of utilizing radioactive substances.

9. During the year trained 9,781 miners in first aid and rescue methods at the mine safety cars and stations as compared with 8,851 in the fiscal year 1918.

10. Investigated causes of 29 mine accidents, 19 at coal mines and 10 at metal mines.

11. Determined the limitations of Army gas masks for use at mine and other fires and in industrial plants.

12. Sampled coal mines for the Navy Department and prepared reports on the quality of coal and the methods of mining and preparing it for market.

13. Continued work on the explosibility of coal dust from different mines, thereby gaining additional information on how coal-mine explosions can be prevented or limited.

14. Continued work on a method of signaling danger to miners underground by the injection of an ill-smelling substance into the compressed-air lines supplying machines and pumps.

15. Continued tests of explosives to determine their suitability for use in mines and quarries. Two new explosives were approved

as permissible for use in dusty or gaseous coal mines. At the end of the year there were 162 explosives on the permissible list.

16. Made further tests of an explosive made of liquid oxygen mixed with carbonaceous material, and studied its suitability for mining work.

17. Determined the value of the geophone, a device for detecting sounds transmitted through earth, coal, and rock, with reference to its use in locating mine fires and in communicating with miners entombed by a disaster.

18. Completed a comprehensive review of explosion tests of coal dust at the experimental mine near Bruceton, Pa.

19. Completed, in cooperation with the Bureau of Indian Affairs, the appraisal of the segregated coal and asphalt lands in eastern Oklahoma which belong to the Choctaw and Chickasaw Nations.

20. Investigated, in cooperation with the Public Health Service, dust and ventilation conditions in mines in Arizona.

21. In cooperation with State mine inspectors collected and published monthly reports on fatalities at coal mines throughout the country.

22. Improved furnaces in boilers for the Emergency Fleet Corporation, increasing the economy 16 per cent.

23. Acted in an advisory capacity for the United States Fuel Administration in matters of conservation.

24. Planned, and had charge of the construction and operation of the Government fuel yard in the District of Columbia, whence all Federal buildings in the District are supplied.

25. Prepared for the War Department special steels containing uranium, tungsten, molybdenum, and zirconium.

26. In administering the act regulating the manufacture, sale, possession, and use of explosives during the war, supervised the work of about 14,000 licensing agents throughout the United States and its insular possessions; investigated accidents at explosives plants; examined magazines for storing explosives; and began numerous prosecutions against violators of the provisions of the act.

27. Cooperated with the War Industries Board in measures to reserve an adequate supply of platinum for war requirements.

28. Began a comprehensive investigation of the white clays of the United States and the value of these clays in the ceramic industry.

29. Cooperated with the Geological Survey of Ohio in making a survey of the fire clays of that State.

30. In cooperation with the State of Idaho, investigated the treatment of complex lead-zinc and copper-iron sulphide ores by flotation.

31. Investigated the fuel value of the lignite in the Nenana field, Alaska.

32. Through field demonstrations showed operators and well drillers how large wastes of oil underground may be prevented by cementing oil wells so as to prevent water from entering the oil sands.

33. Gave the Bureau of Internal Revenue a method for estimating the future and ultimate production of oil fields, and thus determining depletion allowances in taxation of oil properties.

34. Cooperated with the officials of the State of Wyoming in formulating a proposed law governing the drilling of wells in that State.

35. Cooperated with State officials of Illinois in remedying troubles from underground water in oil fields.

36. Made a nation-wide investigation of the grades of motor gasoline being marketed.

37. Demonstrated the value of absorption for recovering gasoline vapors in the residual gas from compression plants for obtaining gasoline from natural gas.

38. Gave further attention to the recovery of oil from the oil shales of Utah and other States.

39. Continued investigations of the fusing temperature of the ash of different coals, in order to show the liability of the coals to clinker.

40. Began a comprehensive investigation of the best methods of utilizing lignite.

ALASKAN ENGINEERING COMMISSION.

During the fiscal year ending June 30, 1919, the following work on the Alaska Railroad was accomplished:

Considerable rehabilitation work on the old Alaska Northern Railway, from Seward (mile 0) to mile 70.

Thirty-eight miles of grading between mile 227 and mile 265 was practically completed; also the greater part of the grading for the 36 miles between mile 417 and mile 453 was completed.

Seventeen miles of rail were laid between mile 74 and mile 91; also 26 miles between mile 365 and mile 391; also 3 miles between mile 414 and mile 417; also 6 miles between mile 453 and mile 459—a total of 52 miles.

Location surveys were continued between mile 265 and mile 365 over the Broad Pass region.

The bridge over the Talkeetna River at mile 227 was completed.

Approach to dock in Anchorage Harbor was practically completed.

Necessary maintenance of sections of the line in operation was attended to.

Fifty-five thousand three hundred and ninety tons of coal were mined at the two Government mines in the Matanuska field.

During the year work was seriously hampered through lack of funds caused by the delay in the passage of the deficiency and sundry civil bills until July. Such a handicap is not expected to recur, as the bill authorizing the appropriation of \$17,000,000 (in addition to the \$35,000,000 originally appropriated) for the completion of the Government railroad was passed by Congress in October. Six million dollars of this amount has been appropriated for the fiscal year ending June 30, 1920, and it is expected that the balance of \$11,000,000 will be appropriated as needed.

Since June 30, 1919, and prior to the time that this report went to press, grading has been completed and track laid from mile 417 to mile 453, thus connecting Nenana and Fairbanks; also about 10 miles of rail has been laid north from Talkeetna at mile 227; also such progress in the construction of the dock at Anchorage has been made that the largest steamers now dock there.

The work which remains to be done includes the following:

Completion of the rehabilitation of the Alaska Northern Railway, including construction of snowsheds and enlarging of tunnels.

Construction of line from mile 237, ten (10) miles north of Talkeetna, to mile 365, five (5) miles north of Nenana Canyon. This is now the only gap in the line from Seward (mile 0) to Fairbanks, mile 471, with the exception of the bridge at Nenana, crossing the Tanana River, and a permanent bridge at mile 373 over the Nenana River. Completion of the dock at Anchorage. A map showing progress on the railway will be found in Appendix C, page 218.

Col. Frederick Mears, shortly after his return from France in July, was appointed chairman and chief engineer of the Alaskan Engineering Commission. Mr. Wm. C. Edes has been appointed consulting engineer.

THE NATIONAL PARK SERVICE.

1. Continued and expanded the work of informing the public about the national parks and monuments under the jurisdiction of this service.

2. Prepared 185,000 and distributed about 167,500 circulars of information relating to these recreational areas.

3. Prepared and distributed approximately 86,000 automobile maps of the national parks.

4. Continued the circulation of large quantities of motion-picture film and lantern slides of scenes in the national parks.

5. Handled the largest volume of tourist travel in the history of the parks; 1919 season, 755,527; 1918 season, 454,841; 1917 season, 490,705; 1916, 358,006; 1915, 335,299; 1914, 240,193.

6. Automobile travel to the national parks during 1919 season, 95,140; 1918, 54,596; 1917, 55,296; 1916, 29,828.

7. Grand Canyon National Park created February 26, 1919, thereby adding this titanic example of erosion to the national park system.

8. Lafayette National Park created February 26, 1919, giving States east of the Mississippi their first national park, and establishing first national park on the seashore.

9. Investigated and reported on merits of Mount Evans section in Colorado as national park material.

10. Completed the improvement of Sitka National Monument in Alaska, which included the repairing and painting of all the great totem poles on this reservation.

11. Secured the repeal of the inhibition against expenditure of more than \$10,000 per annum for Rocky Mountain Park, thereby paving way for greater development of that great scenic area.

12. Investigated status of lands in Hawaii National Park, and arranged for legislation which, when enacted, will assist in securing desirable private lands within park area by exchange of territorial lands.

13. Cooperated with highway and other associations in dissemination of information regarding parks and monuments.

14. Arranged for donation of block of land in city of Hot Springs, Ark., for location of free public bathhouse.

15. Installed a new water system in the Muir Woods National Monument.

16. Completed the road around the rim of the crater in Crater Lake National Park and trails from the road to Sun Notch and Crater Peak.

17. Established the feasibility of airplane travel to Yosemite and Rocky Mountain National Parks.

18. In cooperation with Smithsonian Institution conducted excavation and repair of ruins in Mesa Verde National Park.

19. Constructed new road in Mesa Verde National Park ascending the east side of Point Lookout, giving commanding view over surrounding territory.

20. Improved road through section of Petrified Forest National Monument, thereby opening up further area to visitors.

21. Made important repairs to Tumacacori Mission to preserve it from decay.

22. Made improvements in Casa Grande National Monument for better accommodation of visitors, and cooperated in archaeological investigations made there.

23. Completed trail to Forst's Cave in Shoshone Cavern National Monument, thereby opening up this natural curiosity to the public.

24. Cooperated with scientific societies in excavation work in Chaco Canyon and Gran Quivira National Monuments.

25. Engaged in cooperative work with the Bureau of Service, National Parks and Monuments, of the Railroad Administration, established in Chicago, to inform the public regarding railroad rates and tours to the national parks, monuments, and other resorts.

26. Established a course of lectures on the national parks and their attractions to be given each year in Yosemite National Park.

27. Furthered the establishment of museums in Yellowstone, Yosemite, and Rocky Mountain National Parks. Also at the Casa Grande Monument.

28. Completed new road in Gardiner River Canyon, Yellowstone National Park.

29. In cooperation with the Smithsonian Institution arranged for assembling of data for a book on the wild flowers and trees of Glacier Park, and with the Biological Survey and the University of Washington for a popular volume on the wild life of Mount Rainier National Park.

30. Cooperated with the National Parks Association, the Association of Mountaineering Clubs of America, and other organizations in the dissemination of information leading to a broader use and appreciation of the national parks.

31. Gave special attention to the conservation of the wild life of the parks and monuments, by reduction in number of predatory animals and establishment of game preserves.

32. Planted large consignments of fish in the lakes and streams of some of the larger parks, in cooperation with Federal and State commissions, in order to develop and maintain good fishing waters for tourists.

33. Conducted investigations of large tracts of land containing the redwood, with a view to the further conservation of this rapidly diminishing tree in national parks, and including the reservation of timber along public highways.

34. Collected \$196,703.03 in revenues from the national parks.

35. Prepared new edition of popular pamphlet *Glimpses of Our National Parks*, and copy for *Glimpses of Our National Monuments*.

36. Established new department of landscape engineering for the harmonious development of the national park areas.

37. Surveyed lines for new roads and trails in Grand Canyon, Glacier, and other national parks.

38. Planned for the extensive enlargement of facilities within the park to provide adequate accommodations of every kind for the traveling public.

39. Planned comprehensive trail development for Yosemite National Park.

40. Started detailed survey of floor of Yosemite Valley.

41. In addition to above attended to repair and maintenance work in all the parks under funds provided.

ABSTRACT OF REPORTS OF BUREAUS AND OTHER ADMINISTRATIVE UNITS OF THE DEPARTMENT.

OFFICE OF THE SOLICITOR.

The following table shows the number of matters received and disposed of during the fiscal year ended June 30, 1919, which were docketed or recorded. It does not, however, account for a very large number of miscellaneous matters of which no formal record was kept.

Work of office of solicitor.

	Public lands.		Pensions.		Miscellaneous. ¹	Disbarments.	Summary.
	Appeals.	On re-hearing.	Appeals.	On re-hearing.			
Pending July 1, 1918.....	479	89	281	8	101	6	964
Received June 30, 1919.....	1,360	294	501	26	8,262	20	10,463
Total.....	1,839	383	782	34	8,363	26	11,427
Disposed of.....	1,410	300	677	28	8,278	22	10,715
Pending July 1, 1919.....	429	83	105	6	85	4	712

¹ Under "Miscellaneous" are grouped such matters as opinions, Indian matters, contracts, leases, etc. as well as many other varied matters arising in the several bureaus of the department and which, for one reason or another, may be referred to the solicitor's office for consideration.

From the above table it will be noted that out of a total of 11,427 matters docketed, only 712 were pending and undetermined at the close of the fiscal year; and that the total of each class shows a reduction over that of the previous year. This volume of work represents formal appeals and a great variety of miscellaneous matters coming from every bureau of the department. An additional class of work now also being submitted for consideration by this office is that arising under the law providing for relief in certain cases of contracts connected with the prosecution of the war, commonly known as the "War minerals relief act." Notwithstanding the great volume and variety of work of the office, it is now reached in docket order for consideration within a little more than two months after receipt. By such early disposition, after careful examination of records and thorough consideration of the questions involved, a substantial benefit is conferred not only upon the parties in interest, but also upon a great many others transacting business before the department in various ways dependent upon such adjudication.

The court work during the year shows highly satisfactory results. Three cases against the Secretary were decided favorably by the

Supreme Court of the United States—in two, adverse judgments in the court of appeals having been reversed. The court of appeals decided seven cases in which the Secretary was involved. Of these, two (in one of which this office did not appear for the Secretary) were decided against the department. Eighteen cases were disposed of in the Supreme Court of the District of Columbia, in three instances adversely. In one of these the department took no appeal, leaving the decision final, and making the fourth case during the last 10 years where final judgment has been against the department. Another was a case not defended by this office. And the third, *State of New Mexico v. Lane* (being the one lost also in the court of appeals), is now pending in the Supreme Court of the United States, where it invites final judgment on the question, very important in the administration of public-land laws, as to when a State acquires a vested interest in land embraced in a selection list. Another interesting case decided *at nisi prius* involves the administrative ruling of February 15, 1917 (46 L. D., 32), construing the statutes governing soldiers' additional rights; with which construction the court agrees. Six cases have been argued and submitted, with no decision rendered at the close of the fiscal year. Eleven new suits were filed within the year. There are now pending: United States Supreme Court, 8; court of appeals, 4; Supreme Court of the District, 32; in all, 44. There are two other cases, decided in favor of the Secretary of the Interior by the court of appeals, potentially pending, where the right of appeal has not expired. Aside from these cases, this office represented the Government, unsuccessfully, in another case at the request of the solicitor general.

GENERAL LAND OFFICE.

Area of land entered and patented.—The total area of public and Indian lands originally entered and allowed during the fiscal year ended June 30, 1919, is 11,863,672.28 acres, not including 137,403.27 acres embraced in finals not heretofore counted as original dispositions of land. The latter area is constituted as follows: Public auction, 104,721.15 acres; abandoned military reservations, 7,509.29 acres; cash and private sales, individual claimants and small-holding claims, 14,090.26 acres; pre-emption entries, 86.26 acres; and soldiers' additional homesteads, 10,996.31 acres. The area of 11,863,672.28 acres is an increase of 1,889,340.67 acres, as compared with the area originally entered and allowed during the fiscal year 1918. This increase in allowed entries is due to the stock-raising homestead act of December 29, 1916, 5,559,235.11 acres having been allowed under that act.

The area patented during the fiscal year is 10,777,001.349 acres, an increase of 1,224,519.132 acres, as compared with the fiscal year 1918. Of the above area 8,312,318.888 acres were patented under the homestead laws, an increase of 1,819,521.072 acres, not including as homesteads 13,334.12 acres patented as soldiers' additional entries.

Cash receipts and expenditures.—The total cash receipts from the sales of public lands, including fees and commissions (\$1,194,472.10), sales of reclamation town sites (\$43,863.86), and sales of lands in the Oregon & California Railroad grant (\$114,008.32), for the fiscal year 1919 were \$2,817,063.27. The total receipts from the sales of Indian land were \$1,387,781.74. Other receipts aggregated \$98,829.19. The total receipts of this bureau during the fiscal year 1919 were \$4,303,674.20.

The total expenses of district land offices for salaries and commissions of registers and receivers and incidental expenses during the fiscal year ended June 30, 1919, were \$794,984.62. The aggregate expenditures and estimated liabilities of the public land service, including expenses of district land offices and surveys made from the appropriations for surveying the public lands outside of railroad land grant limits, were \$3,026,554.46, leaving a net surplus of \$1,277,119.74 of receipts over expenditures. Disbursements from the following special deposit trust funds and reimbursable appropriations are not included in the above figures as receipts or expenditures: From deposits by individuals for surveying the public lands, \$47,020.65; from surveying within land grants (reimbursable), \$12,572.36; from opening Indian reservations (reimbursable), \$2,672.93; and from surveying and allotting Indian reservations (reimbursable), \$54,705.49.

Field service.—As the result of investigations in the field, \$101,298.96 were collected and turned into the United States Treasury; in addition to this sum, \$10,944.41 have been placed in the Treasury as royalty on coal mined during the past year from a tract in Colorado, as well as \$26,193.35 as royalty from a coal lease in Wyoming.

As a result of field investigations 164,363.83 acres have been restored to the public domain; of this acreage 85,323.83 acres were restored to open range by abatement of unlawful inclosures without suit.

Special agents have investigated and reported on 17,399 cases, 3,447 of which were adversely and 13,952 favorably reported. Two hundred and fifty-two hearings in Government contest cases have been held. Civil suits in 65 cases were recommended to the Department of Justice as the result of investigations during the year. Eighty-six were tried in court, of which 60 were won and 26 lost. As the result of the successful suits, \$43,895.94 was recovered and

8,091.26 acres were restored to the public domain, of which 6,180 acres had been unlawfully inclosed.

Of the criminal cases tried during the year, 14 resulted in convictions, under which there were six prison sentences imposed and fines amounting to \$1,000 paid.

The prevalence of forest fires on public lands is noted, and the expenditure of money from our appropriation for protecting the public lands as a consequence, and the urgent necessity of a special appropriation for protecting such timber from forest fires, as well as for the reimbursement of the fund for protecting public lands to the extent that it may have been depleted by this cause.

Oil land claims.—California: Referring to the Commissioner's annual report for 1917 for a full statement as to the situation in the oil fields in California and Wyoming in the matter of claims pending in the Land Department and before the courts, and the main questions involved therein, additional data is furnished in tabulated form necessary to bring the oil story up to date, as well as a summary of the present status of proceedings in the courts and in the department.

Wyoming: Additional withdrawals aggregating 98,018 acres were made during the fiscal year and 931 acres were restored as nonoil. On June 30, 1919, 1,180,987 acres were embraced within existing withdrawals. During the year 19 applications for patent, embracing 3,040 acres of land in the withdrawn area, were rejected, and patent was issued on one application embracing 32.22 acres. Patent also issued on two other applications outside of withdrawn area aggregating 100.16 acres. Ten new applications embracing 1,440 acres were filed, and at the end of the fiscal year 58 applications for patent embracing approximately 8,880 acres were pending.

Oil contracts.—At the end of the year there were 40 contracts under the act of August 25, 1914 (38 Stat., 708), in operation in California, embracing 4,165 acres. The production from the tracts covered by these contracts up to June 30 was 8,270,657.92 barrels of crude oil, 709,725,978 metered feet of dry gas, and 698,816 gallons of gasoline, the escrow deposits thereunder amounting to \$1,152,523.48.

In Wyoming nine contracts, covering approximately 800 acres of land in the Salt Creek field, are in force, 27 contracts during the year having been discontinued on the increase of the escrow deposit called for. The total production in Wyoming under these contracts during the year was 9,545,131.20 barrels of crude oil; 286,836,682 metered feet of gas, the escrow deposits amounting to \$3,172,482.36.

The total production in both California and Wyoming under these agreements has resulted in escrow deposits of \$4,325,005.84.

Operations on two 40-acre tracts in the Grass Creek Field held under State leases not covered by agreements under the act of Au-

gust 25, 1914, have resulted in an escrow deposit under special agreement of \$2,119,306.58.

Under arrangement with the operators in California and Wyoming, including those operating in Grass Creek, under lease from the State, \$1,192,400 of the escrow deposits were invested in Fourth Liberty loan bonds and \$1,436,750 in Victory loan notes, which, with the \$2,114.850 theretofore invested in Liberty bonds of the first three issues, makes a total of \$4,744,000 so invested.

"Ferry" or "Caddo Lake" oil lands in Louisiana.—The pendency of litigation on behalf of the United States in the United States District Court, western district of Louisiana, of 18 suits involving the "Ferry" or "Caddo Lake" oil lands was mentioned in his prior report with a brief statement of the facts leading thereto. These suits came up for trial during the spring and summer of 1918. The total amount which the Government sought to recover in the 18 suits was \$614,942.27 and nearly 100 parties, including a number of leading oil companies, were made defendants. On January 11, 1919, the master in chancery filed his report in 17 of the suits recommending decrees in favor of the Government, quieting title to the lands and awarding damages in excess of \$400,000. In the other suit an award favorable to the Government was made with damages to the amount of \$62,581.85. The findings of the master were sustained in a decision handed down by the court July 15, 1919. By this decree the Government has its title to approximately 617 acres of oil lands quieted and obtains possession of 23 producing oil wells, and is awarded the sum of \$462,903.39.

An additional suit has been instituted on the recommendation of the Land Department against certain companies to quiet title to alleged unappropriated, unreserved public lands and to recover the sum of \$317,919.38, the value of oil extracted therefrom.

Arkansas "sunk and lake lands."—Since the issuance of the last annual report the work relative to these lands has been largely in the nature of a cleaning-up process. After the decision of the United States Supreme Court, November 5, 1917, in the case of Lee Wilson & Co. against the United States, the Government was enabled to proceed rapidly with the prosecution of its recovery of these lands, and the past year has witnessed the accomplishment of a large amount of work in that direction. A favorable decree was obtained by the Government on June 25, 1919, in the United States District Court, Eastern District of Arkansas, in the case of United States against Chapman & Dewey Land Co. et al., by which the title was quieted in the United States to an area of approximately 54,000 acres, largely agricultural and timbered lands said to be worth about \$50 per acre, or \$2,700,000.

On June 21, 1919, the Government also obtained a decree in the same court in the case of the United States against John W. Walker et al., involving approximately 700 acres of land. This case is important on account of its value as a precedent. The commissioner makes a full statement of the work accomplished in this field and adds that besides the recovery of the lands noted the Government has also collected and covered into the United States Treasury \$48,719.97 for timber cut in trespass and removed from the lands.

The lands involved in these proceedings were erroneously omitted from the original surveys and have now been restored to the public domain, and most of them are at present included in homestead entries. To date 165 patents have been issued placing the title to about 19,000 acres in private ownership.

Surveys.—The accepted surveys and resurveys for the fiscal year ended is 7,668,514 acres.

The act of September 21, 1918 (40 Stat., 965), provides for an enlargement of the resurvey work, the Government being thereby authorized to resurvey townships heretofore held to be ineligible for resurvey on account of the excess private ownership therein. Suitable regulations for procedure under the terms of this act have been promulgated.

The work of the eastern surveying district includes the miscellaneous fragmentary public lands surveys and examinations and Indian surveys in those States where the former United States surveyor general's offices have been discontinued and the work in this field has been unusually active and productive of results during the year that is past.

Special attention is also called to the surveys in Alaska, with a sketch of their progress from point to point, in order to anticipate the needs of settlers and the development of the territory, particularly in view of the country already opened up by the construction of the Government railroad and the future progress of this enterprise.

The showing made in the offices of surveyors general is especially commended by the commissioner on account of the large reduction of arrearages accomplished in several of the States. Attention is called to the controversies that have arisen over lands lying along Red River where it constitutes the boundary between Oklahoma and Texas. The discovery of oil in this neighborhood has given a sudden value to these lands and the boundary questions will probably be settled in the courts, as the United States has already instituted proceedings for the protection of the rights of certain Indian allottees as riparian owners to adjacent lands.

Drafting and map making.—The edition of the 1919 United States map was only 8,519 copies, while that of the 1918 edition was 15,000 copies, the difference being due to the increased cost, owing to ad-

vancing outlay for labor, muslin, paper, and other materials. The cost of the 1918 edition was \$1.04 and that of the 1919 edition was \$1.90 per map. A larger appropriation for the production of the United States map is necessary to provide the number called for by Congress and for the commissioner's use.

Tract-book notations.—The total number of notations for the year was 376,151. This includes 719 Indian allotments, 12,188 petitions to designate under the acts of February 19, 1909, and December 29, 1916; and 48,079 patents. The number of plats posted was 1,037.

Homesteads, desert entries, timber and stone applications, and kindred applications, were given a preliminary examination, embracing in total 32,193, of which number 24,498 were accepted, and 7,695 held for further action on account of conflicts and for defects of various kinds.

Supplemental patents under the act of April 14, 1914, authorizing such issue on reclassification of lands showing their noncoal character were issued in 1,898 cases.

Homestead and kindred entries.—There were approved for patenting 33,247 homestead entries on which final three or five year certificates had issued, 2,300 commuted homestead entries, 1,883 final homestead entries within national forests, 453 timber and stone entries, and 2,248 miscellaneous cash entries, a total for the year of 40,131 as against 32,120 of the previous year. Applications to make second homestead entries were allowed aggregating 2,792, while 1,097 were denied; 1,224 applications to amend were allowed and 270 denied; 2,108 applications for the sale of isolated tracts were approved, 713 denied.

Stock-raising homesteads.—The commissioner reports satisfactory progress in the matter of designating lands subject to this form of entry, and the allowance of entries therefor. The area of stock-raising lands designated to date is 20,181,868 acres. During the year 14,248 petitions were received asking for the designation of land under the act, and 22,000 petitions of such character received favorable consideration; the whole number of petitions filed asking for such designation since the passage of the act is 48,897. During the year now past the total number of entries allowed under this act were 15,037, covering an area of 5,559,235 acres.

Stock driveways.—The commissioner states that since his last annual report field investigation under the applications of stock men and recommendations of the Forest Service for stock driveways in Nevada and New Mexico has been completed. This work is also completed in South Dakota, Colorado, Montana, Oregon, Washington, and Wyoming, with the exception of certain investigations of incomplete applications or of areas heretofore temporarily withdrawn for such purpose pending further investigation. A few appli-

cations remain to be investigated in Arizona, California, and Idaho; field investigations are progressing satisfactorily upon the remaining applications in Utah. The total area withdrawn for stock driveway purposes at the close of the fiscal year is 6,623,531 acres.

Soldiers' additional homestead rights.—Attention is called to the administrative ruling of June 13, 1919, by the Secretary of the Interior, in which it was directed that the rule of approximation will no longer be permitted in the location of soldiers' additional homestead rights, whether in their entirety, partly, or in combination with their rights or parts thereof. This rule becomes effective December 1, 1919. It was made necessary by the character of the applications of late years, largely made up of small fractions combined under the rule of approximation so as to obtain title to 40-acre tracts by the location of a little more than 20 acres of soldiers' rights and paying the Government price for the excess.

More than 60 per cent of the new applications have been made for lands in the grazing region of California, Nevada, and Wyoming, apparently to obtain control of springs and water holes used by the general public for watering stock on the public range. These applications are all investigated carefully and the lands embraced therein withdrawn for public water reserves if the public need demands such action.

Town-site, town-lot, and kindred entries.—Nineteen town-site and kindred entries were received during the year, amounting, with the four pending at the beginning of the year, to 23, of which number 20 have been approved for patenting, leaving 3 pending.

At the beginning of the fiscal year 112 lot entries were pending, and there were received during the year 1,208, making a total of 1,320 lot entries, of which number 1,251 were approved for patenting, leaving 69 pending at the end of the year. These entries include 1,288 lots.

During the fiscal year there has been received for the sale of town lots outside of Alaska \$112,871.30.

The receipts from sales of lots in town sites in Alaska under the railway construction act of March 12, 1914, amount to the sum of \$28,099.65. Other sales in Alaska under the act of March 3, 1891, have been made in the town sites of Wrangell, Haines, and Douglas. The proceeds from Douglas amount to \$1,257.06, and from Haines \$2,118.20. The trust for the town site of Wrangell has not been completed.

Rights of way.—During the year there were received 430 applications for rights of way of all kinds, of which 81 were for railroad rights of way and 349 for "all others," excepting hydroelectric power projects.

During the year 185 cases have been docketed looking toward the forfeiture of rights of way where there has been no construction

within the statutory period. One hundred and five cases of this kind were finally disposed of in the past year, of which number nine were declared forfeited by decree of court after judicial proceedings, and the balance by relinquishment or otherwise.

State irrigation districts.—In accordance with the act of August 11, 1916, and the regulations thereunder, there have been filed five applications, three in California, one in Oregon, and one in Idaho, involving 131,148 acres of public land, which it is sought to bring under the taxing power of the State, through the approval of the applications by the Secretary of the Interior.

Private irrigation projects.—Sixty-one new reports and 28 supplemental reports have been received as a result of investigations of private irrigation enterprises, and irrigation districts, upon which claimants and applicants under the desert-land laws are dependent for their water supplies, making a total of 978 projects investigated since the adoption of this form of procedure to determine the feasibility of alleged projects.

Hydroelectric power.—During the past fiscal year two permits were granted under the provisions of the act of February 15, 1901, and during the year seven rights of way under the act of March 4, 1911, were also granted.

For the use of public lands under permits and grants for hydroelectric power development, power-transmission lines, etc., the sum of \$8,137.07 was collected.

Carey Act.—Of the 264,533 acres for which applications for patent were either pending or received during the year, 85,699 acres have been patented and 5,460 acres disallowed, leaving 173,365 acres pending at the present time.

Withdrawals and segregations made during the year total 3,532 acres, and restorations during the same period, 565,899 acres.

Desert land.—During the fiscal year 1,675 final desert-land entries were patented, involving 267,065.22 acres.

Reclamation homesteads.—Six hundred and fifty-three final homestead entries under the reclamation act of June 17, 1902, were approved for patenting.

No large opening of farm units occurred during the past year. About 23,000 acres formerly embraced in the Sun River project, Montana, were restored to homestead entry.

Withdrawals were made during the year for the Sentinel project, Arizona; Bruneau and Mountain Home projects, Idaho; Oregon Basin project and Riverton project, Wyoming. The total area of lands withdrawn during the year was 3,868,840 acres, while the area restored was 120,240 acres.

Stock-watering reservoirs.—Applications for 20 stock-watering reservoirs were approved during the year; 205 are yet pending, of which number 133 are awaiting response to calls and 72 office action.

Withdrawals and restorations.—During the past year 9,793,525 acres of public lands were withdrawn or placed in the state of reservation under the various acts applicable thereto, and 4,978,403 theretofore withdrawn have been restored. Some of the withdrawals overlap in part former withdrawals for other purposes, and some are in the form of blanket withdrawals, without strict regard to lands entered or applied for, so that the total of withdrawn lands does not represent accurately the amount of public enterable lands withdrawn. The same may be said of restorations. Under this head the commissioner's report furnishes a tabulated statement.

State selections and State grants.—Indemnity school-land selections aggregating 472,090.33 acres, and selections under grants in quantity embracing 87,080.04 acres, were received during the year. There were certified to the States during the same time 1,277,909.11 acres of indemnity school land and 350,925.46 acres of quantity grant land. Under the several acts of Congress authorizing certification to the States with reservations of mineral deposits to the United States 53,025.12 acres have been thus certified. The commissioner calls attention to the cooperative agreements entered into between the United States and some of the States under which school lands within the boundaries of national forests are exchanged for other lands within forest boundaries, the lands so selected by the States upon confirmation of title being eliminated from the forest; the total so far confirmed to the States under these agreements amounts to 203,750.80 acres.

School grant to the State of Washington.—The controversy between the State of Washington and the Land Department as to the applicability of the act of February 28, 1891, to the school grant made to the State of Washington has been made the subject of an agreement by which the representatives of the State undertake to institute or cause to be instituted and prosecuted to the supreme court of the State and, if deemed advisable, to the Supreme Court of the United States without delay, such legal actions as may be appropriate to obtain decisions on the disputed question. Pending this determination action on some 85,000 acres of selections is withheld.

Railroad grants.—Railroad and wagon-road selections were received during the year to the amount of 529,900.03 acres as against 665,372.49 acres in 1918.

There were patented 632,284.40 acres as against 943,399.78 acres in 1918.

The suit referred to in the commissioner's report of 1918 as having been instituted against the Southern Oregon Co., successor in interest to the Coos Bay Wagon Road grant was settled under authority of the act of February 26, 1919 (40 Stat., 1197), the company executing its deed of reconveyance for some 93,000 acres of land for which the

United States paid \$2.50 per acre and became responsible to the State for the taxes due and unpaid on said lands estimated at over \$547,000. These lands will be disposed of in accordance with the act of June 9, 1916 (39 Stat., 218), providing for the classification and disposition of the lands formerly included in the Oregon & California Railroad grant.

The adjustment of the grant to The Dalles military road under the decision of the department dated January 24, 1917 (45 L. D., 613), wherein it was held that the actual location of the road as constructed defined the limits of the grant and not the diagram theretofore used in adjusting claims thereunder is well under way and the resulting deficiency of 36,066.55 acres is being made good from the limits as thus ascertained.

Practically all of the Oregon & California grant lands revested in the United States by the act of June 9, 1916 (39 Stat., 218), have been classified, except the unpatented lands in the primary limits within forest reserves, approximately 400,000 acres, although this area will be reduced to the extent that the lands are found to be mineral in character. About 472,000 acres, of which 318,000 acres are unsurveyed in the indemnity limit within national forests, are also unclassified. Under present rulings the right of selection by the company of these lands is defeated. Under the adjustment required by the act of revestment it became necessary to survey approximately 182,000 acres of land in the primary limits and in the indemnity limits outside the forest reserves. This survey is now nearly completed.

Timber on isolated tracts of the Oregon & California revested lands, aggregating 2,875.76 acres, has been sold this year, amounting to 65,414,000 feet board measure, for which there was received the sum of \$96,497.83. The act of May 31, 1918 (40 Stat., 593), authorizes the Secretary of the Interior in handling the revested Oregon & California lands to exchange such lands for other lands of approximately equal aggregate value held in private ownership either within or contiguous to the former limits of the railroad grant, when by such action he will be enabled advantageously to consolidate the holding of the timberlands by the United States. A number of applications proposing exchanges under this act, involving approximately 80,000 acres of land, have been received and are now under process of consideration in the office and the field.

Swamp and overflowed lands.—The total area conveyed to the several States the beneficiaries under this grant up to July 1, 1919, is 63,906,694.83 acres.

The commissioner renews his recommendation that legislation be enacted declaring that after a fixed date, preferably six months after

the passage of the act, no new claim to swamp and overflowed lands made by any State shall be received.

Claims in Texas.—During the last year several applications have been made to the commissioner calling for the exercise of jurisdiction of the Land Department over lands within the State of Texas, each of which was denied, and on appeal it was held in the department, June 12, 1919, that the United States had no jurisdiction over public lands or private land claims in Texas and dismissed such applications.

Abandoned military reservations.—The commissioner reports a number of probable sales for the ensuing year with items of interest in connection therewith, especially in the case of Fort Sabine, in Cameron Parish, La., where the lands have a special value on account of their proximity to the Beaumont oil fields.

Indian allotments.—Trust patents have been issued during the year on 2,433 allotments, covering a total area of 395,539.95 acres. With the exception of large reservations in New Mexico and Arizona and the mission reservations in California, the great bulk of lands held in common by the several tribes has now been divided among the individual Indians entitled thereto.

Chippewa logging operations.—During the last year 1,524,120 feet of timber were cut under the provisions of the act of June 27, 1902 (32 Stat., 400), for which the purchasers paid \$9,030.62. The total amount cut up to July 1, 1919, under this act is 1,283,025,956 feet, for which the purchasers have paid \$9,084,839.44.

Minnesota drainage.—During the year there have been approved for patenting 1,118 entries subject to drainage taxes under the Volstead Act of May 20, 1908 (35 Stat., 169), covering approximately an area of 176,320 acres, as against 146,240 acres the previous year. A total area of 766,920 acres have been patented under this act.

Sale of Indian lands.—Within the former Flathead Indian Reservation 4,356.24 acres near Kalispell, Mont., were offered for sale June 20, 1919, and 9,586.05 acres within said reservation, situated in the Missoula land district, were offered for sale June 26, 1919. The lands were listed in tracts embracing from 40 to 160 acres each. Fourteen of the 48 such tracts of the Kalispell lands sold for \$2,466.85, and 16 of the 129 such tracts of the Missoula lands sold for \$2,029.73.

Twenty-six tracts of land within the former Sioux Indian Reservation, S. Dak., embracing from 40 to 160 acres each, were offered for sale at Pierre, S. Dak., and sold under the act of March 4, 1915 (38 Stat., 1189), for the sum of \$4,818.08.

Mining claims.—The total area embraced in approved mineral entries for the year was 32,559.774 acres, for which the sum of

\$137,381.09 was received; in approved coal entries 7,843.17 acres, for which \$295,031.75 was received.

An Alaska coal-land lease of blocks 49 and 50, Bering River field, comprising 2,080 acres, was issued during the year, making a total of 4,500 acres under lease in that field. In the Matanuska field no new areas have been leased. There are now in this field 2,840 acres under lease. No leases have been made in the Nenana field.

During the year leases of potash lands in Searles Lake, Calif., were completed, covering a total of 12,760 acres in 9 leases; another lease for 980 acres of the lake bed has been authorized. Applications for permits to prospect for potash were received to the number of 208 during the year, making a total of 494 applications received altogether. Ninety-three permits to prospect were issued, making a total of 102 permits issued, of which number two have been canceled.

National forests.—There are now 151 national forests, embracing 174,261,393 acres, of which a little over 88 per cent is public land. The net decrease in national forest area since the beginning of the fiscal year is 1,689,873 acres. During the year 1,658,988 acres have been excluded from national forests, 609,925 acres thereof reserved or withdrawn for certain public purposes, and the public lands in the remaining 1,049,063 acres and in 166,875 acres released from temporary or other withdrawals for forest purposes, have been restored to entry and other disposition.

Forest lieu selections.—The decision of April 1, 1918 (46 L. D., 341), in the case of F. A. Hyde & Co., held as to lands in California that if a patent issued to a real person the fact that such patent was fraudulently procured was immaterial if the State had taken no steps to rescind such patents when it was in a position so to do, and was thereafter barred by the statute of limitations. As a result of this decision this class of cases has been practically closed out, and there now remains of the California cases but those wherein it was charged by the Government that the patentees of the State were fictitious persons, and a consolidated hearing as to these cases has been held at San Francisco resulting in 53 cases being returned to the department under remanding orders, 16 being rejected in this office subject to appeal and 31 now awaiting action.

Selections based on lands the title to which was secured from the State of Oregon have been suspended to await the result of suits instituted by the State to cancel patents issued by it on fraudulent representations. The State has been successful in many of these suits and copies of decrees canceling State patents have recently been received, upon which action will be taken as soon as practicable.

Nineteen forest lieu selections have been patented and 50 canceled during the year.

Lieu selections for lands in Indian reservations.—The act of April 21, 1904 (35 Stat., 211), authorizes selections of public lands in New Mexico and Arizona in lieu of lands in Indian reservations. On June 6, 1916, the department decided not to allow any further exchange under this act unless in exceptional cases. Two such cases have recently arisen, the first of 47,056.75 acres in the Laguna Pueblo Reserve, owned by the Santa Fe Pacific Railroad and the New Mexico & Oregon Land Co., and the second of 37,243.63 acres of Zuni lands, of the Santa Fe Pacific Railroad Co.

Contests.—During the year litigation in the land office aside from questions incident to the adjustment of grants and the prosecution of claims for title is well in hand. Ten thousand and seventeen such cases were the subject of final decision as well as 1,654 cases that were dismissed for failure of prosecution on the part of the contestant or in default of answer by the defendant.

Repayments.—Under the several statutes authorizing repayments there were stated during the last fiscal year 762 accounts, allowing repayment of \$80,896.70, and during said period there were denied 285 claims for repayment. Of this number of claims allowed and the amount repaid 91 are accounts allowing the repayment of \$17,601 received in connection with the sale of various Indian reservation lands and repaid from Indian trust funds.

INDIAN AFFAIRS.

Releasing Indians from Government supervision.—The effect of the new policy issued April 17, 1917, is clearly shown by the fact that under the acts of Congress approved May 8, 1916, and June 25, 1910, 9,894 fee patents were issued to Indians in the 10 years from 1906 to 1916, while during the last 3 years 10,956 fee patents have been issued, amounting to an increase on the average annual issuance of 2,663 fee patents under the operation of the new policy.

Within the year, 4,376 fee patents were approved, involving an area of 778,698 acres.

On March 7, 1919, an order was issued calling for lists of all Indians of one-half or less Indian blood, who are able-bodied, mentally competent, and 21 years of age. Under this broadening of the policy it is estimated that 4,500 additional fee patents will be issued.

Attention is being given to the clearing up of inherited estates, of which there are approximately 20,000, and detailed instructions have been issued to the Field Service for settling these estates by partition or sale of the land and issuing fee patents to the heirs wherever practicable under the policy of April, 1917, which will further increase the number who will be no longer wards of the Government.

Citizenship.—The question of Indian citizenship has become of foremost interest, and has been the subject of several bills recently introduced in Congress.

As far back as 1817, provision was made in a treaty with the Cherokees by which any member of that tribe who desired might become a citizen of the United States. Subsequent treaties and acts of Congress contained provisions by which members of other tribes might become citizens.

The question whether under the Fourteenth amendment to the Constitution an Indian could, by severing his tribal relations, and completely surrendering himself to the jurisdiction of the United States, become a citizen thereof was determined in the negative by the Supreme Court in *Elk v. Wilkins* (112 U. S., p. 100).

No general law provided a means for citizenship of all Indians until 1887 when Congress passed the general allotment act (24 Stats. L., 388), which provided for the allotment of lands in severalty and declared all Indians born within its limits, who shall have complied with certain conditions, to be citizens of the United States. The broad citizenship provisions of this act were modified by Congress when on May 8, 1906, it passed the Burke Act, since which law the issuance of a fee patent has been the primary legal requirement for citizenship of Indians. It is believed that the controlling factor in granting citizenship to Indians should not be based upon their ownership of lands, tribal or in severalty, in trust or in fee, but upon the fact that they are real Americans and are of right entitled to such citizenship.

War as a civilizer.—Few things more helpful have come to the Indian race than the enrollment of 10,000 of its sons as American soldiers to challenge the barbarous rule of central Europe. Mingled indiscriminately with white troops, the Indians of necessity learned their language besides having equal opportunity with them for observation, for maturing judgment, and developing courage through contact with events and conditions that trained and toughened character in defense of a just cause and a great ideal. Many reports from superintendencies are in line with the following:

A number of full-blood Cherokees lately returned, none of whom could speak a word of English on entering the service, now talk English fluently.

I do not know of a single case where the returned Indian has not benefited, mentally and physically, to a degree plainly noticeable and commented upon by the whites of his community.

Five of these soldier boys returned recently from their work in France with a broader outlook on life and a desire to do something creditable to themselves and their people.

Those who have returned to the reservation show amazing progress in many ways—self-reliance, industry, personal habits, and proper respect for authority.

The refusal of your office to permit the segregation of Indian troops was of the greatest benefit, resulting in most cases in but one Indian to a company of

white soldiers and thus compelling them in every way to take up the life and manners of the white man. I safely say that our returned soldiers now constitute the best type of young Indian manhood.

He has greater self-confidence. He realizes that there is a place for him in the community; that he is a unit in the great Commonwealth.

The distinguished-service record of the Indian was probably not below that of any other people engaged in the war. He bears his honors modestly, which prevents definite information regarding many cases of individual valor. From instances cited in a partial list it is doubtful if a more brilliant one stands to the credit of any soldier than the achievement of Pvt. Joseph Oklahombi, a full-blood Choctaw, of Oklahoma, who received the *croix de guerre* under an order of Marshal Petain, a translation of which follows:

Under a violent barrage, dashed to the attack of enemy position, covering about 210 yards through barbed-wire entanglements. He rushed on machine-gun nests, capturing 171 prisoners. He stormed a strongly held position containing more than 50 machine guns and a number of trench mortars. Turned the captured guns on the enemy and held the position for four days in spite of a constant barrage of large projectiles and of gas shells. Crossed "no man's land" many times to get information concerning the enemy and to assist his wounded comrades.

Education.—The Indian schools accomplished their full work under the course of study with but slight exception, although vacancies occurred in many important positions owing to war-time conditions. Such deficiencies as prevailed were due more to the per capita allowance of funds, which was not proportionate to the advanced cost of supplies, than to other causes.

In order further to increase the attendance of Indian children in the public schools, where such schools are available, and to require well-to-do and citizen Indians to defray the cost of their children's education, the school rules were amended with a view to eliminating certain classes and thus affording better provisions for those in greater need of Government aid. Under the amended rules—

There shall not be enrolled in Government nonreservation schools any Indian children who are not under Federal supervision without prior authority from the Commissioner of Indian Affairs.

There shall not be enrolled in any Indian reservation boarding or day schools any Indian children not under Federal supervision, except such as are entitled to share in the benefits of treaty or trust funds from which the school is maintained, without prior authority from the Commissioner of Indian Affairs.

Except as to reservation schools supported from tribal funds or under specific treaty stipulations, Indian pupils who have ample financial resources or whose parents have such resources sufficient for payment of all or part of the expenses of the pupil's education, whether or not the parents are wards of the Government, shall be required to pay their transportation, and all or part of the actual cost of their support and education, not to exceed \$200 a year, or at the rate of \$20 a month for a fraction of a year. Superintendents will enforce this regulation.

The purpose is to push actively the policy of reserving the Indian schools for children who are not provided with adequate free schools facilities and to pay tuition for those who have access to public schools but whose parents are wards of the Government.

Under this policy it was practicable within the year to discontinue 10 boarding schools and a number of day schools, which will result in better schooling for the more needy, ample care for those who attended the abolished schools, and a more economical administration.

Owing to abnormal costs of labor and material, construction of new school plants was impeded during the year and projects of this nature were conducted in open market at a saving over contract work of approximately 40 per cent.

Indian fairs and Indian exhibits at county and State fairs are adjunctively growing features of education. Fostered by certificates of merit and prizes, much is thus learned industrially, and the "better baby show," now a prominent feature, is a distinct impetus to better health.

Employment of young men and women in various lines of commercial, agricultural, and mechanical work was greatly extended, and now supplements the schools with practical training of importance that foretells economic stability and progress among the Indians.

Health.—Except for the epidemic of influenza and the sorrows of that severe visitation the health record of the Indians for the past year could be written as normal, notwithstanding the impairment of the service by the heavy loss of both physicians and nurses in response to war demands. But the great pandemic was on the whole efficiently resisted by great personal effort and sacrifice on the part of the field personnel generally. Many localities were handled with splendid results, and in one of the largest schools not a single case developed among 600 pupils and employees.

The health problems among the Indians are essentially the same as in rural communities and school assemblies. The service emphasizes those things which prevent disease and aims to secure better housing, better water supplies, better bodily nutrition, the practice of hygiene, sanitation, and well-ordered living. Constant effort is made to promote Indian industry in general and particularly farming. Agriculture and thrift are regarded as the pillars of a health arch of which sanitary education is the keystone. Work and prosperity lead to health and happiness.

With the resumption of normal conditions, definite health plans will be carried forward under thorough organization in districts requiring special attention.

Suppression of the liquor traffic.—The liquor forces continue to violate the law wherever it seems possible to acquire huge profits. The year has been an active one, notwithstanding the war restrictions

against the manufacture and sale of liquor. There were 1,516 new cases instituted during the year, 2,135 cases disposed of, 33,924 gallons of various kinds of intoxicants seized and destroyed, and 112 automobiles engaged in the illegal traffic libeled and sold for \$42,869. The year's operations covered 27 different States, and include prosecutions for violations of State, Federal, and municipal laws.

An investigation of complaints that Indian Service officers were destroying unfermented grape juice in large quantities in Minnesota disclosed that many carloads of California grapes were being shipped into the territory covered by the Indian treaty containing prohibition against intoxicating liquors, but that they were not being used for making the ordinary form of "grape juice." Thousands of gallons were destroyed, but no action was taken against any person using grapes for ordinary unfermented grape juice.

The value of prohibition to the La Pointe Indians appears in information indicating that from the date it was effective, July 1, 1918, the total arrests for the next 6 months in the city of Ashland, Wis., were 236, as against 1,366 for the last six months of the wet period.

Farming and stock raising.—Upon the assumption that postwar conditions would require increased production to satisfy foreign and domestic demands, with as little soaring of prices as possible, the Indian field service was urged early to renew and stimulate for greater results the previous year's campaign. Emphasis was given to early preparation for the seedtime; the necessity for garden culture, the raising, drying, and canning of vegetables and fruits for home consumption as a measure of releasing other products for market, and especially to the extension of cultivated lands by the Indians. Responsive reports were encouraging from nearly every quarter, indicating that the high standard of war-period production would be maintained and in many localities surpassed.

Barring such unforeseen visitations as hailstorms, drought, and grasshoppers the crop results of the past year will be highly satisfactory throughout the Indian country. A most encouraging element is the greater use of agricultural machinery and a tendency to adopt modern improved methods of tillage.

In cotton-producing sections high-grade Pima seed has been furnished Indian farmers, and their crops are comparing well with those of the best white farmers.

The Indians have made continued progress in the live-stock industry even against the occurrence of successive droughts in some sections. They are showing special interest in the improvement of breeds by the purchase of first-class sires.

In addition to the natural increase there were purchased during the year approximately 3,200 cows and heifers and 450 steers. The

suppression of contagious diseases has progressed satisfactorily, and on several reservations in the Northwest, ranges are reported to be free from infected animals.

Irrigation.—Much allotted land of minors and adults who, from age or other disabilities, can not cultivate their entire holdings, is leased on favorable terms to white farmers, and production thus increased with profit to all concerned.

Advanced cost of labor and material for irrigation construction has been measurably offset by the greater use of machinery, such as dredges, dragline excavators, ditch cleaners, etc., thus also overcoming labor scarcity. The Yakima, Wash., project has been extended, and with new land under cultivation the gross yield was approximately \$9,000,000. The Fort Hall, Idaho, Reservation will surpass previous years in products by irrigation, and in Montana the Crow lands under ditch tided that country over great drought severities.

The Fort Belknap Reservation in Montana is an example of progressive irrigation methods by the Indians who do practically all of the farming.

Additional wells have been installed in the Papago country, and, with the operation of the old ones, further increases the stock-raising industry, which is the chief means of support.

The water problem of the Navajo and Hopi in Arizona and New Mexico is slowly yielding to solution by the sinking of wells to supply drinking water for herds in areas of pasture that would otherwise be wasted. There are now 1,000,000 sheep and goats on the reservation of these Indians, and with sufficient funds, thousands of acres, affording reasonably good forage, can be utilized to increase their herds.

Aid has been extended to the Pueblo of New Mexico, and sanitation in their villages has been improved in some instances by the installation of domestic water supply, drainage, and sewer systems.

Allotment, sale, and leasing of land.—On the Gila River Reservation in Arizona 1,213 allotments of irrigable and nonirrigable land were made during the year, also 270 allotments, of 80 acres each, were made on the Umatilla Reservation, Oreg., and approximately 1,000 reallotments were made, under provision of law, on various reservations.

Allotments were made to 16 Indians in various national forests, and a total of 315 allotments, comprising 46,207 acres, were made on the public domain.

During the year 907 pieces of Indian land, covering 115,367 acres were sold for \$2,803,232, an average of \$25.65 per acre, the highest average price ever received from like sales.

The leasing of agricultural land in excess of the amount the Indians can cultivate was continued with good results, particularly on

the Uintah and Ouray Reservation in Utah, where the leasing of about 70,000 acres of irrigable allotted land was practically completed as a measure of saving the Indians' water rights which, under the law, would have been forfeited by the close of the year in default of making beneficial use of the water.

The Five Civilized Tribes.—To date of June 30, 1919, 3,578,934.38 acres of tribal land had been sold for \$20,376,096.27, being \$4,536,108.67 more than the appraised value. The estimated total value of unsold tribal property of the several tribes is as follows:

Choctaw and Chickasaw Nations.....	\$17, 689, 720
Creek Nation.....	172, 200
Seminole Nation.....	38, 900

Only one tract of 10 acres of the Cherokee Nation remains unsold.

During the year a competency commission visited the Creek Tribe at their homes to determine who are capable of handling for themselves all business transactions affecting their allotted lands. Restrictions on 57,000 acres of allotted land were removed.

Money was disbursed to individual Indians last year from land sales, equalization, royalties, and per capita payments amounting to \$7,812,331.44, an increase of more than three millions, and houses, barns, improvements, equipments, and miscellaneous articles were constructed and purchased at a total cost of \$1,110,618.53. The Indian farmers responded beyond expectations to the emphasis laid upon agriculture and stock raising, and the Five Tribes scored a splendid record in the purchase of Liberty bonds, war savings stamps, and the number, estimated at 4,000, who were in military and naval service.

The Indian exhibit.—The Indian exhibit at the Interior Department Exposition held in May, 1919, consisted of enlarged photographs showing the educational and industrial progress of the Indians; how they helped to win the war by service in the Army and Navy, the purchase of Liberty bonds, Red Cross work, and food production. Specimens of native Indian handicraft, such as beadwork, hand-embroidered garments, artistic designs in laces and bags, and various similar articles made by Indian pupils, were shown; also canned and preserved fruits and vegetables, and many interesting products of the domestic science and art classes and the mechanic art shops of the Indian schools.

Forestry and road work.—The larger timber sales of the year were the eastern division unit, on the Tulalip Reservation, consisting of 65,000,000 feet; the Omak unit of 25,000,000 feet, on the Colville Reservation; the Stinking Lake unit, 25,000,000, on the Jicarilla Reservation; and the Northern Spring Creek unit, of 26,000,000, on the Klamath Reservation. A sale of 6,000,000 feet, known as the Big Bend unit, on the Klamath, was made late in the year, and the

Camas Creek unit, of 24,000,000 feet, on the Flathead Reservation, was advertised for the receipt of bids on July 15, 1919. The Apache Lumber Co. has been engaged in erecting a large mill within the area purchased by it on the Fort Apache Reservation in 1917. Approximately 30,000,000 feet have been cut under the contract of the International Lumber Co. on the Red Lake Reservation. A more intelligent and comprehensive system of laying out and maintaining highways on the reservations is being developed under the congressional appropriation available for this purpose, and as the Indians are more and more appreciating these essentials of modern economical development greater progress is anticipated. Indian labor is largely employed for road work, with the exception of the necessary experienced supervision, for which white foremen must be used.

Probate work.—Under congressional limitation of probate attorneys to matters affecting restricted allottees or their heirs, individual cases are receiving more effective attention. This work in Oklahoma, which for part of the year was retarded as a result of diminished service caused by the war, is proceeding normally.

Steps will be taken to test the constitutionality of a recent act of the Oklahoma Legislature changing the rules of probate procedure, which previously as adopted by the State supreme court had been uniform, to a system authorizing each county judge to promulgate rules governing the procedure in his court. The new plan, permitting each of 40 counties to have a different set of rules, if sustained, will severely cripple the bureau's probate organization.

During the year attorneys appeared in 7,024 regular cases, instituted 270 civil actions, involving \$268,638, and finally determined 232 civil actions, besides attending to a large volume of other probate work.

In the probating of estates of deceased Indians outside the Five Civilized Tribes, 2,414 cases were finally disposed of. One thousand eight hundred and eighty-seven of these related to estates under trust patents, 176 to restricted-fee patents, 51 to personal property, and 97 to inherited interests. One hundred and eighteen will cases were received, 75 of which received action. Fifteen examiners of inheritance held hearings in 26 reservations. Miscellaneous cases pertaining to probate work to the number of 2,914 were also disposed of.

Mineral interests.—During the year oil leases on certain lands of the Osage Indians aggregating 95,337 acres were sold for a bonus consideration of \$10,299,900, in addition to royalties, an average of about \$101 an acre. Also gas leases on 511,488 acres were sold for a bonus of \$1,173,920.48.

On Osage lands at the close of the year there were 4,442 producing oil wells, 468 producing gas wells, and 124 wells being drilled. The year's gross production of oil was 12,138,086 barrels, of which the

Osage Tribe received 2,043,458 barrels. The total receipts for the year from oil and gas accruing to this tribe approximated \$17,000,000.

In the Five Civilized Tribes, 717,594 acres were under leases for oil and gas. The year's total production of oil on restricted land was 10,180,862 barrels and the total revenue from oil and gas \$4,073,985.22. During the year 495 wells were drilled, 307 producing oil and 57 producing gas.

Outside the Five Civilized Tribes in Oklahoma the Indians on the Kiowa Reservation received about \$800,000 from oil and gas and those of the Otoe Reservation received \$50,589.48 from like sources. Producing wells on the Pawnee and Ponca Reseryation are also bringing a substantial income.

In the Seneca jurisdiction there has been a great development of lead and zinc mining, resulting in a mining center of about 50,000 population and a tenfold increase of agency business.

Under recent legislation metalliferous minerals on unallotted Indian lands in Arizona, California, Idaho, Montana, Nevada, New Mexico, Oregon, Washington, and Wyoming will be under exclusive control of the bureau.

Miscellaneous matters.—Forty per cent of reimbursable funds expended for individual Indians has been repaid. The balance is not delinquent, as it is payable in installments. The beneficiaries as a rule have been doing well and in many cases need no further assistance. Tribal herds established from such funds have been profitable, and these are a guaranty of payment. Eventually this stock will be placed among individual Indians.

The disbursement of individual Indian funds to both adults and minors is proceeding under more liberal principles in furtherance of the gradual emancipation of the Indians from Government control, and if an adult Indian is at all competent he is given unrestricted control of his funds. During the year over \$10,000,000 of individual moneys were paid directly to the Indians or expended for their benefit.

One of the principal per capita payments of the year was the distribution of \$200,000 among the Indians of the Uintah and Ouray jurisdiction in Utah, a portion of which was applied to special advantage in supplying irrigation to allotments and securing water rights to the Indians.

Indians in New York.—Unusual problems have arisen in connection with the affairs of some 5,000 Indians still in New York who own seven reservations, including over 80,000 acres. The State has for some time exercised extensive jurisdiction over these Indians, and there has been supervision by the Federal Government on various matters. Recent court decisions have tended to strengthen the view that the State is without power to deal with their tribal

property rights. A commission authorized by the New York Legislature to take up with Congress and the Federal departments the question of jurisdiction and administrative control of their affairs has not yet formulated its course of action, so that a more definite statement can not at present be made.

The Florida and Texas bands.—Encouraging progress is being made in behalf of the Seminoles of Florida. Their interests are being supervised by an experienced field-service man whose degree of Indian blood gives him fortunate access to the nature and needs of this band. An industrial center is being created for the purchase of small beginnings in live stock, awakening their interest in education and conserving their health.

An appropriation of \$5,000 is being used in constructing a school building for the Alabama Indians in Texas, to be completed for the coming school year, which will accommodate all their children of school age.

Homeless Indians in California.—Two inspecting officers have been detailed under explicit instructions to make a thorough survey and study of the nonreservation Indians in California and their needs, concerning whom conflicting reports as to their health, poverty, and moral condition have been received. When completed this survey will afford an intelligent basis for action. Lands and homes for certain of these Indians were purchased during the year at an approximate expense of \$16,000.

Papago land litigation.—There is pending at this time in the Supreme Court of the District of Columbia a case which is regarded as one brought to test the validity of 16 purported quit-claim deeds attempting to convey to one Robert F. Hunter, late of Washington, D. C., a one-half undivided interest in 16 tracts of land alleged to represent the "lands and grants" of certain Papago Indian villages located in Pima County, Ariz., and now embraced in the Papago Indian Reservation created by Executive order of February 1, 1917. The lands in which the interest is attempted to be conveyed aggregate approximately 2,600,000 acres.

In this suit are involved questions of title to practically all the land embraced within the limits of the present Papago Indian Reservation, and its successful prosecution is of vital interest to the Papagos of that country. For this reason a special supervisor of this office has for the past year been engaged in a thorough investigation of the entire situation and in assisting the Department of Justice.

PENSION OFFICE.

Number of pensioners.—There were on the roll at the end of the fiscal year 624,427 names, a net loss of 22,468 from the total of 646,895 on the roll at the beginning of the year.

The number of Civil War soldiers on the roll June 30, 1918, was 298,808, and on June 30, 1919, 271,391, showing a decrease of 27,417. The number of deaths of Civil War soldiers in 1919 was 27,703, as against 30,466 in 1918.

The number of Civil War widows on the roll June 30, 1918, was 288,815, and on June 30, 1919, 293,244, showing an increase of 4,429.

The deaths of widows, minor children, and dependents in 1919 numbered 19,217, as against 18,412 in 1918.

The highest number of Civil War soldiers on the roll was in 1898, when there were 745,822. The highest number of Civil War widows on the roll was in 1912, when there were 304,373.

Of the War of 1812, there were surviving on June 30, 1919, 81 widows.

Of the War with Mexico, there were on the roll June 30, 1919, 215 survivors and 2,739 widows.

Of the War with Spain, the total number of original claims allowed by the bureau is 41,335. The number on the roll June 30, 1919, by reason of the War with Spain, is 28,251.

Unexpended balances of appropriations.—The unexpended balances of appropriations at the end of the fiscal year were as follows:

For Army and Navy pensions.....	\$947, 170. 97
For fees and expenses of examining surgeons.....	38, 771. 74
For salaries.....	118, 419. 86
For per diem and expenses of special examiners.....	None.

Disbursements for pensions.—The amount disbursed in the payment of pensions for the year was \$222,159,292, as against \$179,835,329 for the preceding year. The amount appropriated for the payment of pensions for the fiscal year 1919 was \$223,000,000, as against \$183,000,000 for the preceding year. A deficiency appropriation of \$3,000,000 was made in addition to the original appropriation of \$220,000,000 for the fiscal year. The larger amount was due because of increases given by new legislation.

The number of pensioners residing in foreign countries in 1919 was 3,747, and the amount paid to these pensioners was \$1,188,188.

Certificates issued and applications filed.

Pension certificates issued on admitted claims during the fiscal year....	54, 984
Reissues in lieu of lost pension certificates (duplicates) during the year....	1, 335
Accrued pension orders issued during the year.....	20, 103
Widow's increase orders, act of Sept. 8, 1916, issued during the year ending June 30, 1919.....	81
Total.....	76, 503

There were received and classified in the Law Division during the year 61,756 applications of all kinds.

Division of pension.—Under the act of March 3, 1899, providing for division of pension of resident pensioners of the United States

who have deserted their wives or children or who are inmates of soldiers' or sailors' homes, 429 cases were acted upon.

Under the act of August 8, 1882, of all claims of widows and children of pensioners undergoing imprisonment or insane without a guardian, 26 cases were acted upon.

New legislation.—The act of July 16, 1918, provides pension to widows and minor children of officers and enlisted men who served in the War with Spain, the Philippine insurrection, or in China:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That from and after the passage of this act if any volunteer officer or enlisted man who served ninety days or more in the Army, Navy, or Marine Corps of the United States, during the War with Spain or the Philippine Insurrection, between April twenty-first, eighteen hundred and ninety-eight, and July fourth, nineteen hundred and two, inclusive, service to be computed from date of enlistment to date of discharge, or any officer or enlisted man of the Regular Establishment who rendered ninety days or more actual military or naval service in the United States Army, Navy, or Marine Corps in the War with Spain or the Philippine Insurrection between April twenty-first, eighteen hundred and ninety-eight, and July fourth, nineteen hundred and two, inclusive, or as a participant in the Chinese Boxer rebellion campaign between June sixteenth, nineteen hundred, and October first, nineteen hundred, and who has been honorably discharged therefrom, has died or shall hereafter die leaving a widow without means of support other than her daily labor, and an actual net income not exceeding \$250 per year, or leaving a minor child or children under the age of sixteen years, such widow shall upon due proof of her husband's death, without proving his death to be the result of his Army or Navy service, be placed on the pension roll from the date of the filing of her application therefor under this act, at the rate of \$12 per month during her widowhood, and shall also be paid \$2 per month for each child of such officer or enlisted man under sixteen years of age, and in case of the death or remarriage of the widow, leaving a child or children of such officer or enlisted man under the age of sixteen years, such pension shall be paid such child or children until the age of sixteen. *Provided,* That in case a minor child is insane, idiotic, or otherwise permanently helpless, the pension shall continue during the life of said child, or during the period of such disability, and shall commence from the date of application therefor after the passage of this act: *Provided further,* That said widow shall have married said officer or enlisted man previous to the passage of this act: *Provided, however,* That this act shall not be so construed as to reduce any pension under any act, public or private.

Under this act pensions have already been granted to 992 widows, 72 minor children, and 1 helpless child.

Attention is called to the fact that a distinction was made between services of volunteer officers and enlisted men and those in the Regular Establishment as a prerequisite to the allowance of widows and minors pensions in said act. In the case of Anna, as widow of Oscar J. de Rochmont, decided by the Assistant Secretary of the Interior, January 31, 1919, it was held:

Volunteer officers and enlisted men mentioned in the act of July 16, 1918, refer to those who were members of volunteer organizations as distinguished from the Regular Establishment.

Their dependents are pensionable if such an officer or enlisted man served during the period of any of the wars mentioned in said act for 90 days or more and was honorably discharged, independent of the geographical locality of such service.

The dependents of an officer or enlisted man of the Regular Establishment are not pensionable under said act unless such officer or enlisted man rendered actual service. "Actual military service" mentioned in said act are words of limitation, and are descriptive of such duty in a war as is to be performed by one in the Army and Navy from being on the scene of conflict; that is to say, at the theater of operations on sea or land, of invasion of enemy territory, of repelling invasion by the enemy, and the like.

When the bill was pending before the House of Representatives, Mr. Keating of Colorado, in charge of the bill, made a preliminary statement, page 9672 of the Congressional Record of July 9, 1918:

This bill does not provide pension for the widow or the minor children of a soldier or sailor of the Regular Establishment unless he actually left the confines of the United States and participated actively in the War with Spain.

In the case of Rebecca, as widow of Jeremiah Cottrell, decided by the Assistant Secretary of the Interior, May 19, 1919, it was held:

Enlistments in the Navy under the naval appropriation act approved May 4, 1898, for the naval service for the fiscal year ending June 30, 1899, were enlistments in the Regular Naval Establishment, and such persons were not "volunteer officers or enlisted men" as are mentioned in the act of July 16, 1918. The claimant's husband was enlisted under the provisions of the act of May 4, 1898, was a member of the Regular Naval Establishment, and as his entire service was outside the zones of conflict in the War with Spain, Philippine insurrection, or Chinese Boxer rebellion campaign, his widow has no title to pension under the act of July 16, 1918.

Special acts of Congress.—During the year 28 omnibus bills to grant pensions by special acts of Congress were enacted into law. These acts granted pension or increase of pension to 3,442 individuals, among whom was the widow of ex-President Roosevelt.

Marriage and divorce.—Many claims require determination of the marital status of the parties. During the fiscal year 589 such cases required formal opinions by the Law Division for their determination. The fact that hardly any two States have the same laws concerning marriage and divorce complicates the situation. Complaint has been made with increasing volume because of the rigorous requirements of the law, and the practice in the Pension Bureau, as to proof of validity of the marriage relation. After living with the soldier as his wife for a long period, as his widow a claimant is often called upon to show the soldier's previous marital history for a period sometimes covering more than 40 years. Under existing laws the Pension Bureau has no power to change its practice in this respect, and as the hardship imposed upon worthy women increases with the lapse of time, it is thought that Congress should pass some legislation looking to relief. It might, for instance, declare that

cohabitation for a fixed period of time up to the date of the soldier's death should give rise to a conclusive presumption for pensionable purposes, that the wife thus cohabiting is the legal widow of the soldier to the exclusion of any other.

Lands for the loyal.—Secretary Lane's plan to furnish land and homes to our soldiers and sailors who fought in the world war is in keeping with the former policy of the Government. For service in wars prior to 1855 the Pension Bureau issued land warrants to 798,701 applicants, embracing 68,793,870 acres.

Monthly payment of pensions.—There seems to be a general demand among soldiers and soldiers' widows for the monthly payment of pensions. The need of payments at shorter periods than quarterly is patent to everybody. An estimate has recently been furnished the Committee on Invalid Pensions in the House of Representatives showing that for the current year an additional appropriation of \$175,000 would cover the expense involved in the change. From February 1, 1913, when the system of paying pensions through a disbursing office in the bureau was established to take the place of the agency system, to June 30, 1919, there was paid out in pensions a total of \$1,140,433,323.10 without a single item being disallowed by the officers of the Treasury for improper payment. At the beginning of the period the force employed in paying pensions numbered 275, the pensioners on the roll, 837,000; at its close, 163 and 624,427 respectively.

Pension Bureau work.—The Pension Bureau has by years of study, training, and experience built up an efficient system of handling pension claims. It has a highly skilled corps of examiners, who by training, study, long experience, and knowledge of the various pension laws and decisions, have become expert in determining the rights of claimants to pension. It also has a highly competent, technical, and experienced corps of medical examiners who pass upon all medical questions arising in a claim, and a field force whose duties are to investigate doubtful or difficult claims and those in which criminal features are involved. The bureau has equipment and electrical machinery for preparing and mailing millions of checks each year. This equipment and machinery is operated by highly skilled employees.

Should Congress provide for civil-service retirement, the monthly payment of pensions, and the transfer of the compensation feature of the Bureau of War Risk Insurance to the Bureau of Pensions, this bureau could easily assimilate and dispose of the additional work entailed at a minimum outlay for clerk hire and other necessary expenses.

Age of employees.—The following statement shows the number, ages, etc., of employees in the Pension Bureau on the 1st day of

July, 1919, considered especially with reference to civil-service retirement:

Number in classified civil service.....	874
Age of oldest employee.....	88
Number over 80 years of age.....	26
Number between 65 and 80 years of age.....	266
Based on age of 65, number eligible for retirement.....	292
Percentage of all employees eligible for retirement.....	33.4
Average age of all employees July 1, 1919.....	58

Metal boxes for the files.—In former reports statements have been made showing the superiority of metal boxes for the files over the leather strap heretofore used. The metal boxes cost about 64 cents as against 80 cents for a strap, and the life of a box is indefinite, whereas a strap only lasts a few years. A total of 23,500 boxes have been purchased, and it is estimated that 56,462 more boxes would be sufficient in which to place all the files.

PATENT OFFICE.

During the first half of the year, owing to war conditions, there was a noticeable falling off in the number of applications for patents filed. After January 1, 1919, however, a steady increase in the number of applications became noticeable, and at the end of the year the receipts were fully normal. During the year a total of 75,657 applications for patents, including reissues, designs, trade-marks, labels, and prints were filed. This was 2,350 more than were received during the preceding year ending June 30, 1918, and 5,882 less than for the year ending June 30, 1914, when the receipts reached the maximum number in the history of the office. During the year 8,354 applications were forfeited for failure to pay the final fee, but this number is less by 1,159 than that of the previous year. The total number of patents granted and trade marks, prints, and labels registered was 43,353. This was 2,725 less than in the preceding year and 10,124 less than in the year 1916. The receipts of the office for the year were \$2,113,350.17, being an increase of \$9,689.61 over the preceding year.

BUREAU OF EDUCATION.

Statistics.—During the year a representative of the Bureau of Education has visited 12 States for the promotion of the bureau's plan to secure the cooperation of State departments in the adoption of a uniform system of compiling and reporting statistics. The plan is to give recognition to State departments as the center from which all educational reports come, and from which all authentic data concerning educational institutions, public and private, may be obtained. As a result of this plan:

1. Comparable statistics for all States will be secured and made available by the Bureau of Education.
2. Local school officers will be relieved of the duty of making numerous reports in different forms.
3. The State department of education will gain in prestige and recognition as the head of the entire educational system of the State.

Correspondence.—First-class mail matter received by the Bureau of Education during the year amounted to 227,958 pieces, an increase of 65,479 from the number received in 1918. These numbers include both the Washington and field offices.

Library.—The library continued to acquire new additions of publications as they were issued and also added material of earlier date. Among the most unique and comprehensive collections acquired is that of textbooks used in elementary and secondary schools of the Argentine Republic and Brazil. The library has secured nearly all of the new European books on education published by friendly nations during and since the war. In addition to educational bibliographies compiled and circulated, a series of leaflets were issued, monthly records of current educational publications, and the 1918-19 sections of the Educational Directory revised.

Publications.—During the year the bureau has had printed a greater number of documents than in any other similar period of its history. One million five hundred and five thousand four hundred and forty-eight of these were distributed by the mailing division, and, in addition, 1,396,518 mimeograph letters were sent out. Bulletins on all the important phases of education were published and distributed; leaflets on secondary and higher education, circulars, reading courses, and lessons were distributed. School Life, a bureau publication issued twice a month, has a circulation of 20,000. School Service, another bureau publication distributed semi-monthly during the early part of the year with a circulation of 583,000, was discontinued on May 1.

Educational surveys.—A number of educational surveys were carried on during the year, among which are the following: A study of the educational system, elementary, secondary, and higher, in the State of Alabama; a study of consolidation in Mount Joy Township, Pa.; survey of Belle County, Tex.; survey of the following cities: Memphis, Tenn.; Columbia, S. C.; Passaic, N. J. All of these were made at the request of the school officials concerned with the administration of the schools surveyed.

Activities of the divisions of the bureau.—Besides engaging in the educational survey of Alabama, the Division of Higher Education passed upon the eligibility for accrediting by the United States Naval Academy of 473 institutions; prepared statistical reports con-

cerning higher institutions; represented the bureau at meetings and conferences on higher education; organized a series of conferences for the preparation of a course of study in agricultural education. The members of the division were intimately connected with the entertainment of the British Educational Mission and assisted in planning their itinerary to visit institutions in the United States.

Under the direction of the Rural Division, important conferences were held on rural education at Stevens Point, Wis., Daytona, Fla., and Oklahoma City, Okla. Conferences were attended by persons prominently identified with public affairs, and the bureau's program for rural school improvement was set forth. Members cooperated with States and institutions in several additional conferences and educational campaigns. The educational section of the Department of the Interior Exposition, held in the spring of 1919, was under the direction of this division.

Studies have been made as follows: Rural education in Nebraska; standardization of rural schools in the United States; the administration and supervision of village schools; principles of school legislation; status of rural teachers in Nebraska; certification of teachers in the United States; teachers' salaries; consolidation of schools in the United States. Members of the division participated in the educational survey of the State of Alabama, and made a survey of Mount Joy Township, Pa.

The Division in City School Administration participated in three educational surveys; prepared a bulletin on the phonic method of teaching reading; made studies on the causes of failure and non-promotion, and prepared and distributed circulars concerning educational legislation.

In the kindergarten section, leaflets were prepared on kindergarten promotion and assistance given in the campaign for kindergartens in Texas. This division also assisted the War Department in selecting equipment of kindergartens in the Government schools.

The specialists in industries and home making and agricultural and commercial education participated in conferences and prepared bulletins and circulars; assisted in several surveys and cooperated with other organizations—such as the Food Administration and the Young Men's Christian Association—in educational work.

The specialist in school hygiene and physical education cooperated with the Public Health Service and the Child Health Organization in the preparation of a health education series; assisted in surveys made by the bureau, and advised with county and State school boards concerning buildings. Studies were made on physical education in normal schools, janitor service in the city schools, and similar subjects.

The School Garden Army continued its work of organizing the school children of the country to cultivate gardens. Over 5,000,000 manuals and leaflets concerning garden instruction were distributed. Moving-picture films were shown to over 300,000 persons. At the end of the fiscal year, 1,813,352 children were enrolled in 2,125 cities of the United States. The total value of products for the year is estimated at \$48,000,000.

The Division for School Board Service registered 20,000 high-grade teachers during the year and made 15,000 nominations to school boards.

A Division of Educational Extension was maintained in the bureau for six months with an allotment of \$50,000 from the President's fund for national security and defense. Particular attention was given to Americanization work through the distribution of material concerning courses for teaching emigrants, books on the teaching of English, and the like.

By means of a cooperative agreement by the Secretary of the Interior and the American Nationalization Committee of New York, the regular work of the Bureau for Americanization was enlarged. One section was maintained in Washington and one in New York. As a result of the work done through this division, the importance of Americanization has been emphasized and the problem clarified; important laws have been enacted, Americanization societies organized, and the cooperation of a number of organizations and activities secured.

Alaska.—During the year the field force of the Bureau of Education in Alaska cooperated with the Public Health Service in an effort to furnish relief to the natives during the influenza epidemic. Nurses and doctors were sent from Washington State to cooperate with the bureau's physicians and nurses, all of whom were placed at the disposal of the governor and rendered zealous service in the native villages. People of the Territory and the Red Cross cooperated. The bureau continued the policy of encouraging the establishment of cooperative enterprises in native villages. By the congressional appropriation of \$75,000, the medical work of the bureau among the natives of Alaska was continued during the year. Physicians and nurses were employed and several hospitals erected in which native girls are trained for nurses. The superintendent of education for Alaska has assumed charge of the work of taking the 1920 census for Alaska.

War work.—All of the divisions of the bureau continued to do a large amount of war work until the armistice was signed and after. They have cooperated with the War Industries Board in passing on applications for promotion to direct school buildings and issue bonds.

The commissioner submits a series of 29 recommendations for better work and greater usefulness on the part of the bureau. He urges that its staff be greatly increased and made more than proportionally effective by the addition of an assistant commissioner, a private secretary to the commissioner, an assistant editor, a specialist and assistants in foreign educational systems, two collectors and compilers of statistics, additional specialists in higher education, rural and industrial education, commercial education, school hygiene, city school administration, community organization, and a greatly increased staff of stenographers and clerks. He asks that the statutory salaries of several members of the present staff be increased, and that the limitations on the salaries paid from lump-sum appropriations be removed.

To the present organization of the bureau the commissioner would add the following listed divisions:

1. For the study of exceptional children, both subnormal and super-normal, and the best methods of educating them.
2. For scientific experiments in methods of education.
3. For the study and eradication of adult illiteracy.
4. For Americanization work among the foreign-born population of the United States.
5. For the study of and help in the home education of children.
6. For educational extension work.
7. For a school board service to assist school boards in securing high-grade teachers.
8. For the study and establishment of model rural schools.

He asks for the reestablishment of the Division of Negro Education and Backward Peoples with an annual appropriation of 25,000.

For medical and relief work in Alaska and for the education of the Alaskan natives he desires appropriations, respectively, of \$125,000 and \$300,000. To these Alaskan activities he would add the work of assisting the natives to develop and establish their own remunerative industries.

Finally, the commissioner points out the very great need of a Federal educational building in which may be housed the bureau and the Federal Board for Vocational Education.

GEOLOGICAL SURVEY.

Nature of the work of the year.—During the first half of the fiscal year practically all the energies of the Geological Survey were concentrated on war work. A census of the country's resources of manganese, chromite, tungsten, and quicksilver and of oil, gas, and coal was made, field work was done to discover new deposits, and maps and data showing the distribution of the mineral deposits in foreign countries, their quality and extent, the output of districts

and regions, and the trade distribution of minerals in the world's commerce were prepared. These maps proved so valuable to all the agencies that used them that it has been decided not only to make them public but to continue and keep up to date the compilation of like data for the benefit of American industry and commerce.

The work of the last half of the year has consisted largely of the completion of the field projects undertaken and the orderly summation and conservation of the military and economic results. Classified estimates of the country's mineral reserves have been completed and made available for future use in war or in peace, sampling of minerals and estimates of quantities available have been followed by contributions to our knowledge of the mode of origin of ores or minerals, and the special military inquiries as to underground water, road-building materials, rare minerals, and other subjects examined have led to broader views and better methods of work. Some of the war work—for example, the preparation of frequent reports showing the rate of production and transportation of coal—has been carried along, to the advantage of both the producer and the consumer.

The appropriations for the work of the survey for the fiscal year 1919 amounted to \$1,437,745.50. The roll of members holding appointments from the Secretary at the end of the fiscal year numbered 967, a decrease of 33.

Geologic surveys.—The geologists of the survey were engaged during the year in finding, examining, and studying deposits of manganese, chromite, tungsten, zirconium, molybdenum, iron, salt, high-calcium lime, white clays, nitrates, potash, and sulphur, chiefly for the purpose of supplying military needs. A wall map showing the deposits of manganese ore in the United States classified as to types was prepared. Military maps of the country around several camps and training stations, with accompanying descriptions, were prepared and printed; data were gathered for the use of the staff of the Chief of Field Artillery in selecting sites for artillery ranges and cantonments; information was compiled on road-building material and on water supplies for the use of the Chief of Engineers in connection with the preparation of the progressive military map of the country, and information was compiled concerning the mineral deposits and production of other countries. Cooperation was arranged and put into effect with several States, universities, and councils of defense; special statements and summaries were prepared for the War Industries, Shipping, and War Trade Boards and the information that was of greatest immediate need to the public was promptly published through newspapers and technical magazines. Since the armistice was signed illustrated reports on the economic geology of the many deposits studied have been in prepara-

tion or are already published, and data have been compiled for the information of the War Minerals Relief Commission.

Cooperation with the Fuel Administration was continued, and commercial data on coal were mapped and filed so as to be readily available for the use of the Fuel Administration and other branches of the Government. The consideration of questions relating to the pooling and zoning of coal led to the preparation of a detailed and comprehensive scheme of classification of coals.

The search for new reserves of petroleum to supply war demands was continued.

The most important cooperative investigations were made with the Bureau of Mines and the War and Navy Departments in the search for helium-rich natural gas; with the Capital Issues Committee of the Treasury Department in examinations and reports on applications for capitalization; and with the Bureau of Internal Revenue in the compilation of the records of production of oil and gas fields, the calculation of the rates of depletion, and the formulation of rules to govern the application of income-tax laws to the depletion of oil and gas field properties.

The geologists of the survey cooperated in military and commercial investigations with the Ordnance, Aviation, and other branches of the War and Navy Departments, with the War Trade Board, the War Industries Board, the Fuel Administration, the Food Administration, the Capital Issues Committee, the Bureau of Internal Revenue of the Treasury Department, the Tariff Commission, the Bureau of the Census, the Bureau of Standards, the State Department, the Shipping Board, the Railroad Administration, the Federal Trade Commission, the Department of Justice, the Forest Service, and the Office of the Supervising Architect of the Treasury. In scientific investigations they cooperated informally with the Smithsonian Institution, the Bureau of Lighthouses, the Bureau of Fisheries, the Coast and Geodetic Survey, and the research laboratories of the Smithsonian Institution. Investigations have been undertaken or planned at the request of the Governments of the Dominican Republic, Haiti, the Virgin Islands, and Porto Rico, and assistance has been given to the geological departments of a number of colleges and universities.

The special investigations made for the military departments and branches of the Government included search for material for smudges, for porous rocks to be used in making more buoyant concrete ships, and for underground water for many cantonments and military and naval training stations, examination of target ranges, determination of locations for military storage places, examination and estimate of resources of natural gas, and investigations of resources of nitrate and potash both at home and abroad.

The restriction by an allied country of the exportation to America of high-grade clays near the end of the war led to an investigation in the eastern part of the United States of deposits of high-grade clays that might be used in making paper or in the manufacture of porcelain or of articles used in electrical equipment. A report on the investigation has been written for publication.

Studies were made of the geology and paleontology of the Canal Zone under an agreement between the Panama Canal Commission, the Smithsonian Institution, and the Geological Survey.

Geologic work was done in Porto Rico and the Virgin Islands with special reference to the ground water supply.

Certain reported deposits of chromite in the Dominican Republic were examined to determine whether the deposits were available for the military use of the United States.

Cooperative work on deposits of chromite and manganese in Cuba was done, and arrangements were made to render assistance to the Cuban Government in petrographic and paleontologic work.

The laboratory work included about 1,500 analyses and assays, among them more than 100 tests of rocks for platinum, a metal much needed for military use. Special determinations of the potash content of certain rocks were made.

Surveys in Alaska.—As most of the topographers and several of the geologists of the survey who had been working in Alaska either entered the Army or were assigned to work to be done in connection with the prosecution of the war it was not possible to continue the survey's work in Alaska in the customary way. The work done consisted principally of investigations of deposits of chromite and tin, surveys and examinations in the region that is being developed by the Government railroads, measurements of stream flow, and the usual census of the mineral production of the Territory.

Ten parties were engaged during 1918 in Alaska surveys and investigations. Eight of the parties were engaged in geologic surveys, one in topographic surveys, and one in stream gauging. The areas covered by reconnaissance geologic surveys on a scale of 1:250,000 (4 miles to an inch) amount to 3,500 square miles. Much of the time of the geologists was devoted to the investigation of special problems relating to the occurrence of economic minerals, the results of which can not be expressed in terms of area. About 1,200 square miles was covered by reconnaissance topographic surveys on a scale of 1:250,000 (4 miles to an inch). In cooperation with the Forest Service, stream gauging was continued in southeastern Alaska. Of the parties whose work may be classified geographically, three parties worked in southeastern Alaska, three in the Cook Inlet-Susitna region, one in the Yukon Basin, and two in Seward Peninsula.

Field work for the season of 1919 was begun before the end of the fiscal year by three parties.

The survey's branch office at Anchorage was maintained throughout the year to provide closer cooperation between the Geological Survey and the operators of the Government coal mines in the Matanuska Valley, as well as to aid the mining industry in the region tributary to the Government railroad, to keep in touch with local developments in mining and prospecting, and to furnish whatever aid may be rendered by giving information, advice, and publications to all who are engaged in mining and prospecting.

Statistics of mineral production.—Work in mineral statistics was carried on mainly for military purposes during the first half of the fiscal year.

Weekly statistics of the production of copper, lead, zinc, and aluminum were collected and were furnished to the Government purchasing agencies, a system of monthly reports covering the raw mineral materials that were of chief use in the war was established, and diagrams and tables showing not only the supplies available but the estimated requirements were prepared by the Geological Survey in cooperation with the War Industries Board and the mineral specialists of the Shipping Board. By contributions of geologic and statistical information and by the judgments of its trained specialists the Geological Survey aided the Capital Issues Committee in directing capital into those fields where it would be of maximum usefulness during the war.

During the year the survey contributed reports on mercury, graphite, phosphate rock, manganese, antimony, tungsten, magnesite, emery, corundum, bauxite and aluminum, and platinum to a series of mimeographed pamphlets issued by the Interior Department under the direction of the Bureau of Mines, showing the political and commercial control of these commodities throughout the world. Specialists of the survey also prepared chapters on mineral commodities and on economic conditions in Japan and Sweden for reports compiled by the Bureau of Research of the War Trade Board.

A voluminous index of the information on mineral resources in the possession of several Government organizations was compiled and was published in mimeographed form through the cooperation of the Central Bureau of Planning and Statistics.

The cooperation between the survey and the Fuel Administration in the collection of statistics of the coal and coke industries, begun in 1917, was continued throughout the year. Most of the details of this information will be published by the Fuel Administration, but summaries of the more essential data will be incorporated in the survey's volumes on the mineral resources of the United States.

Topographic surveys.—The new area mapped during the year was 10,068 square miles, making the total area mapped in the United States at the end of the fiscal year 1,289,958 square miles, or 42.6 per cent of the country. In connection with these surveys, 4,206 linear miles of primary and precise levels were run and 1,420 permanent bench marks were established. Primary traverse lines, aggregating 4,217 miles, were run, in connection with which 611 permanent bench marks were set. Triangulation stations numbering 61 were occupied and 50 were permanently marked.

In addition to 82 topographic maps and 69 accompanying tracings showing military information, a large wall map of the world was prepared for the use of the Shipping Board.

Detachments of enlisted men of the Four hundred and seventy-second Engineers, who were detailed to the Geological Survey for training in topographic-map drafting, assisted in drafting military maps in the office of the survey or were assigned to similar duty in other offices. In all, about 100 men reported for instruction.

Water resources.—Investigations of stream flow were continued by means of more than 1,200 gaging stations maintained in 38 States and in Hawaii and Alaska, and investigations of ground water were made in 12 States. Many investigations of the present and probable future use of both surface and ground water were made in connection with the classification of public lands, with special reference to their use for power under permit or for agriculture under the enlarged-homestead, desert-land, or Carey acts.

Investigations made in cooperation with the United States Fuel Administration of problems relating to the operation of power plants, interconnection of transmission systems, and substitution of water power for fuel power led to improvement in service and conservation of fuel. Statistical studies of power resources and output were continued after the armistice was signed.

Many reports based on special field investigations and office studies were prepared and submitted to the War Department and to boards and bureaus engaged in the conduct of the war, the work including the compilation of information concerning water supplies from springs and wells in different parts of the country, as well as maps and descriptions of water supplies along the international border and the Atlantic coast. During the war information and advice were given to the War and Navy Departments in regard to water supplies at about 100 military and naval establishments in the United States, such as cantonments, forts, navy yards, aviation fields, powder factories, arsenals, and supply depots.

The manuscripts and maps for two reports on desert watering places were completed and work on other like reports was well ad-

vanced, this work being done under a comprehensive plan for mapping and marking the watering places in the arid region east of the Sierra Nevada and the Cascade Range and west of a line running from eastern Oregon through Salt Lake City and Santa Fe to the mouth of Pecos River.

Land classification.—Public lands aggregating 6,439 acres were classified as to their content of coal, 3,703 acres being classified as coal land and 2,736 acres as noncoal land. The coal land withdrawn from entry during the year amounted to 2,415 acres; the land restored to entry after classification and appraisal amounted to 3,331,552 acres.

The probable oil land withdrawn from entry amounted to 239,946 acres; the land restored to entry as nonoil land amounted to 931 acres. The result of the year's work was an increase of the area of oil reserves from 6,519,819 to 6,758,834 acres.

The net result of the withdrawals and restorations of oil-shale lands has been to reduce the oil-shale reserves 3,754 acres, leaving 128,267 acres reserved, practically all of it for the use of the Navy. In addition, 129,421 acres have been classified as to their content of oil shale, of which 4,080 acres were classified as nonmineral land and 125,341 acres were classified as lands valuable as a source of petroleum and nitrogen. A total area of 4,117,377 acres is now classified as oil-shale land and valuable for minerals, so that the grand total of oil-shale land now classified or withdrawn is 4,245,644 acres.

The area included in phosphate reserves remains the same as it was a year ago—2,724,394 acres.

The existing potash reserves were reduced by the restoration of 440 acres, leaving the area of outstanding reserves 130,029 acres.

The land withdrawn for power sites amounted to 7,392 acres, and the land restored amounted to 6,037 acres, the total area now so reserved aggregating 2,565,727 acres.

Lands amounting to 8,452,637 acres were designated as nonirrigable under the enlarged-homestead act, and designations of land amounting to 5,251 acres previously classed as nonirrigable were canceled on information that the lands are irrigable. The net increase in the area classified under these acts was 8,447,383 acres, and the total area so classified was 288,797,241 acres.

At the end of the year 20,181,868 acres had been designated as subject to entry under the stock-raising homestead law of December 29, 1916, as the result of field examination and office study. The number of applications pending under the law on June 30, 1918, was 34,649, and the applications received during the fiscal year 1919 amounted to 14,218, making a total of 48,897 in hand. Of this number 29,176 were disposed of during the year, leaving 19,721 cases on hand.

The area added to the public water reserves during the year amounted to 22,422 acres, and the area eliminated from such reserves amounted to 1,375 acres, a net increase from 204,634 to 225,681 acres.

The cooperation with the General Land Office, under which reports are submitted by the survey containing information as to the mineral value and water resources of lands for which applications under the public-land laws have been filed, was continued unchanged during the year. Similar cooperation exists with the Indian Office. In addition to 1,532 requests for information as to mineral character, power value, and value for public watering places pending June 30, 1918, 5,034 such requests were received during the fiscal year. Of these requests 4,259 were acted upon, leaving 2,307 awaiting action at the end of the year.

At the beginning of the year 295 requests for information as to mineral character only were pending, and during the year 1,665 such requests were received. Reports were made on 971 of these requests, leaving 989 pending at the end of the year.

During the year 151 requests for report as to water resources only were received, and 35 were pending at the beginning of the year. Reports were submitted on 151 requests, leaving 35 pending June 30, 1919.

The survey also furnished to the General Land Office reports upon the feasibility of irrigation projects and proposed power developments under the terms of the general plan between the two bureaus. Closely related to this cooperation is the duty of the survey to classify land under the enlarged and stock-raising homestead acts and to prepare appropriate orders for departmental approval designating lands under those acts.

Publications.—The Geological Survey's lithographic plant continued its war work for bureaus, boards, and offices of the War Department, the Navy Department, and other branches of the Government, the product including aviation maps and military maps of camps and other areas in the United States and abroad, charts, diagrams, and other work in editions aggregating several hundred thousand. Thirty new topographic war maps were photolithographed and printed and nine special maps showing Army camps and cantonments were compiled and printed with special texts on their backs.

Regular topographic maps of areas in the United States numbering 140 were engraved and printed. Editions of 360 different maps, amounting to 945,293 copies, were published.

Contract and miscellaneous work involving the printing of 2,935,543 copies was done, and the total number of copies of all work printed amounted to 3,881,819, an increase of nearly 20 per cent over the work done in the preceding fiscal year.

The regular series of the survey's publications printed at the Government Printing Office included 147 reports, aggregating 11,644 pages. During the year the survey distributed 465,826 books, 8,865 folios, and 538,396 maps.

RECLAMATION SERVICE.

It is now 17 years since the passage of the reclamation act, during which the surveys, examinations, and construction therein authorized have proceeded under the provisions of that act and other acts amendatory thereof and supplementary thereto. During the present year the service is in position to deliver water to about 1,600,000 acres of irrigable land, covered by crop census, of which about 1,120,000 acres are now being irrigated. Besides this storage water is delivered from permanent reservoirs under special contracts to about 950,000 acres more. The projects that have been undertaken have been planned to provide for an area of about 3,200,000 acres. This latter figure is tentative and subject to variation in accordance with the development of plans as the work progresses.

Drought conditions.—A large portion of the arid region has been subject to severe drought for the past two years, leading to heavy losses on the part of those attempting to cultivate the soil without irrigation and leading to shortage of water supply in many irrigated regions. The reclamation projects have been remarkably free from drought conditions, owing to the ample storage provisions usually made, the only notable exception being a small project in northern Washington where the drought conditions are so intense that shortage has been suffered on a few thousand acres of irrigated land. The general requirement for irrigation, together with the striking success of agriculture under the Government projects, has greatly stimulated demands for the extension and completion of existing projects and the construction of new ones.

Investigations of new projects.—Investigations have indicated the feasibility of many large projects in various parts of the West. Many of these, however, require far more work in surveys and estimates to make them available for construction, and liberal appropriations have been made by various States for this purpose, frequently on the condition that an equal amount of money be advanced for the same purpose by the General Government. The major portion of the investigation work now carried on by this service is expended under such contracts, the local contribution being made in some cases by the States and in others by voluntary associations.

Projects and extensions of projects investigated by the Reclamation Service in the Western States.

State and project.	Irrigable acreage.			Mean altitude.	Mean rainfall.	Probable cost. ¹	Readiness for construction.

Irrigable and irrigated acreage.—The statistics of irrigation show that on the projects of the Reclamation Service there are about 500,000 acres of land to which the service is ready to deliver water but which are not irrigated. This immediately raises the query as to why this is so and suggests that further development be delayed. As a matter of fact, such a conclusion would be entirely unwarranted.

The most important item in the acreage not irrigated consists of the unirrigated portions of farms that are occupied and cultivated but have not been wholly brought under cultivation. The reduction of the average farm in the arid region to actual cultivation by the occupier requires clearing, leveling, and ditching, and is a slow process with the average settler, who has limited capital and is probably depending upon his own efforts and his own teams to accomplish results. The facts are that on the average three-fourths of each occupied farm is actually under irrigation, and this is a very good showing under the circumstances. Many old-settled communities have done little better.

The next item of importance is the acreage represented by holdings of nonresidents or of persons owning more than 160 acres and who are unable to purchase water right for the excess holding. The law prohibits the sale of water rights to nonresidents and to holdings greater than 160 acres. Gradually the excess holdings are being disposed of to new settlers, and the nonresidents are either selling to settlers or are themselves gradually occupying the lands and placing them under cultivation.

A third class is composed of the public lands that are open to entry and have not been filed upon. These are comparatively few, are distributed on several of the public-land projects, and are as a rule lands but recently opened to settlement or are of inferior quality, so that while they may be eventually taken this is not done until after the better opportunities are exhausted. Roughly speaking, the area

covered by crop census to which we can deliver water may be divided about as follows:

	Acres.	Per cent.
Occupied farms partly cultivated.....	1,312,000	82
Nonresident and excess holdings.....	240,000	15
Unentered public lands.....	48,000	3

Advantages of irrigation farming.—Agriculture in the arid region where irrigation is feasible has several important advantages over that in the humid region. The soils of the arid region by the nature of the case have generally not been leached of their mineral plant foods as have those in the humid region, and they are therefore much richer in this respect on the average and are seldom or never acid, as are soils in the humid region. This quality has the disadvantage at times of leaving the arid lands charged with hurtful alkalis, which seldom remain in the humid region on account of their solubility, but where the injurious salts do not predominate the general principle of abundance of mineral plant food obtains and constitutes a distinct advantage for the soils of the arid region over those of humid regions.

There is much advantage in being able to apply water to growing crops at just the time and in just the quantity needed, and to withhold it at will. Where the water supply is ample this constitutes a very important advantage in arid regions.

Another striking advantage is the preponderance of clear days in an arid region, where the absence of rainy and cloudy weather affords a much larger percentage of sunshine than is found in humid regions. As sunlight is one of the most important essentials of healthy plant growth, this advantage is quite important.

Results from these advantages.—It appears that the average gross product of agricultural crops on reclamation projects is just about double the average yield from nonirrigated lands in the country at large. The larger product obtainable per acre from irrigated lands justifies and permits a more careful and intensive cultivation, which with a favorable climate and controllable water supply, yields more certain results than the same care in the humid region.

This means that as much product can be obtained from a 40-acre tract under irrigation as from the average 80-acre tract in the humid region. This, of course, requires more labor per acre, but much less labor in proportion to product. It permits and encourages intensive cultivation and smaller holdings and consequent greater centralization of population. The result is that the isolation of country life is to a large extent eliminated as the irrigating farmer will have fully

twice as many neighbors within a given radius as his prototype in the humid region. The social advantages thus obtained react upon the character of the people and of the communities and other conditions characteristic of irrigated regions to a similar effect.

Cooperation with his neighbors is forced upon the irrigator because it is usually impracticable for him to irrigate his land without such cooperation, the feasible irrigation projects usually being in tracts of many thousands of acres, accommodating thousands of families and giving rise to towns, villages, and characteristic civilizations of their own. This condition stimulates the civic conscience and attention to public affairs of common interest so that the local governments that grow up under such conditions are usually of a superior order and controlled by a superior intelligence on the part of the population living thereunder.

Irrigation progress.—During the past year the operations of the Government under the various reclamation laws have continued to develop the resources of the projects undertaken as shown by the gradual increase in the area for which the service can supply water, the increase in areas actually irrigated and cropped, and the increase in the value of crop produced. This progressive increase is shown in the following table, which gives statistics only for those areas covered by crop census, excluding practically all those additional areas which are served from the works of the Reclamation Service under Warren Act contracts and from which crop statistics were not obtainable. It is estimated that, including these areas, the crop value in 1918 amounted to \$100,000,000 or over.

Year.	Irrigable acreage.	Irrigated acreage.	Cropped acreage.	Crop value.
1913.....	1,181,362	694,142	637,227	\$15,676,411
1914.....	1,240,875	761,271	703,424	16,475,517
1915.....	1,330,222	814,906	757,613	18,164,452
1916.....	1,405,452	922,821	858,291	32,815,972
1917.....	1,502,468	1,026,633	966,784	56,462,313
1918.....	1,601,934	1,119,566	1,051,193	66,921,396

The statistics given in the above table do not, however, tell the whole story. The easy terms of repayment granted by the Government and the high prices received for their products have combined with the other favorable conditions and with the industry of the people to produce a condition of prosperity beyond the indications of the bare statistics.

¹ City lots.

No new projects undertaken.—No new projects have been undertaken within the past year, as there have been no funds available for this purpose. The gradual decline in the receipts from the sales of public lands, due largely to the wholesale disposal of these lands under the operation of the 640-acre homestead act, has naturally greatly restricted the operations under the reclamation act. The small payments provided by law from the irrigated lands have kept the returns from the constructed projects to a low point. It is now necessary, under the provisions of existing law, to set aside \$1,000,000 per annum from these receipts to repay the advances to the reclamation fund which were provided by the act of 1910, known as the "bond loan." It has been possible on this account only slightly to extend the irrigated area by some extension of canal systems and to take care of water-logged conditions on some of the projects.

Seepage and drainage.—The industry of irrigation by which water is applied to the surface of the soil for the growing of crops is necessarily attended by a considerable escape of such water to the subsoil, where in most cases it joins ground water, and this gradually rises. Such a condition is of course aggravated and expedited by wasteful applications of water, and this is very difficult to avoid if the soils are open and porous, but even in case of

tight soils and a reasonably economical use of water some rise of ground water is likely to occur, and very few irrigated regions of magnitude exist in the world which have not attached to them an important drainage problem. Accordingly, during the last few years one of the largest and most important activities of the Reclamation Service has been the provision of suitable drainage works on the various projects where these are required. In some cases these have been practically completed and are serving their purpose well, but in the majority of cases they are still in progress, and the available construction funds are not sufficient to carry this on with the requisite speed and economy. Hence considerable areas which ought to be returning construction charges are held back for this reason, as it is of course impossible to collect the charges from unproductive land.

Reclamation project operations.—The Salt River project in Arizona is being operated by the local organization of water users under a contract by which the Secretary of the Interior turned over the works and the income of the large power plants constructed in connection with the project. It is in a prosperous condition and the income from power a good deal more than pays the construction charges. The Government connection with this project is confined to occasional inspection and supervision, as provided in the contract. The ground water is rising on this project and will require early attention in order to prevent injury to a considerable area of land. This has been investigated by the water users' association, which is alive to the problem and will doubtless take necessary action.

On the Yuma project, Arizona-California, the Yuma Valley, which lies in Arizona, has been placed under public notice, but the payments are being contested by the water users' association. This contest came to trial in the month of April and the case is now held under advisement by the court. The Yuma Valley is exceedingly prosperous, having, with one exception, the highest gross yield per acre of any of the projects of the Reclamation Service. This for the year 1918 was over \$113 per acre, exclusive of live-stock increase. Announcement has been made of the sale of a portion of the lands on the Yuma Mesa, which will be irrigated with water pumped from the main canal south of the city of Yuma under the provisions of a special act of Congress. A contract has been executed with the Imperial irrigation district to connect its system with Laguna Dam and provide better security for its water supply.

The Orland project in California is regarded as the first unit of a comprehensive project for the development of the Sacramento Valley. It, however, stands as a self-supporting project, with an ample water supply from Stony Creek, a tributary of Sacramento

River, and has been practically completed. Public notice on this project was issued in 1916 and all payments are made promptly when they fall due by the association as a whole. Thus all the annoyance, expense, and risk of delinquency are voluntarily shouldered by the water users' association, which has shown a commendable spirit of cooperation from the first. The project is prosperous and constantly growing in development. The only construction work in progress is a small amount of permanent canal lining, which was provided for in the current public notice, and which is necessary for checking the seepage from the canals constructed in coarse material.

The Grand Valley project in Colorado is delivering water to a portion of the land which has been opened to entry and occupied by settlers. The agricultural operations are gradually extending and results are encouraging. The physical conditions in this valley are difficult on account of the seamy shale which occurs on the canal system and which has required a large amount of maintenance and betterment work to render the canals tight. Aside from these difficulties, the works are operating in a very satisfactory manner.

The Uncompahgre project, Colorado, is being operated by the United States under contract with the Water Users' Association upon the payment of the cost of such operation by the association. The contract provides that the operation may be turned over to the Water Users' Association whenever they so elect, and this is being consummated. The existing contract provides for the operation and cost for a period of five years, at the end of which period the project is to be opened under public notice unless further extension is made by the Secretary of the Interior. At that time, according to the contract, the construction repayments will begin. The construction of the project is completed, so far as the plans of the Government have been made, but the distribution systems, which remain in the hands of the irrigators, are very unsatisfactory and should be enlarged and improved. The cultivation of the lands is gradually extending and slow improvement is being made in the use of water which is very wastefully applied to the lands. Efforts are being made to introduce the rotation system and to charge for water on an acre-foot basis, which will be necessary before good practice in the economy of water can be hoped for. The excessive application of water is manifested by a rising water table and the destruction of the fertility of some of the land. Agriculture in general is successful, and the settlers are prosperous.

The Boise project in Idaho includes the Arrowrock and Deer Flat Reservoirs, which have been completed, and a canal system which now delivers water to the main body of the project. Contemplated extensions will be made gradually to conform to better practices regarding the use of water which is sufficient for irrigating about

40,000 additional acres of land if used with reasonable economy. Public notice was issued in 1917 announcing the charges on the completed portion of the project, but the water users brought suit to escape a portion of the repayment, and this has been tried in the United States court. A preliminary opinion has been handed down by the court which holds that the full cost of the project must be paid by the beneficiaries but withholds decision upon several points of detail.

In addition to the main project, the United States, under 11 special contracts, delivers storage water to about 150,000 acres of lands that are served by independent systems. The current year has been one of exceptional drought, and it was preceded also by a very dry year. It is the general opinion, as expressed by the water users and the local press, that the benefits of the past season from the storage works constructed by the Government have been greater than the total cost of those works in the increased product upon the lands served by stored water, which would have been without water except for these works. The project as a whole is very productive and successful.

The Minidoka project in Idaho as originally planned has been completed, but several extensions are possible and desirable. The project is in two portions: That which is served with irrigation water by gravity has been formed into an irrigation district which operates the canal system serving it under contract with the United States; the pumping unit on the south side of the river is operated by the United States. The results of irrigation in this region are very striking and exceptionally successful.

The Huntley project in Montana is practically completed, and is one of the most successful and thickly settled projects of the service. Drainage work is in progress, and some enlargement of a portion of the delivery system is also being made. Construction payments upon the lands served are being regularly made.

In the Milk River Valley, Mont., water is being delivered through a canal leading from St. Mary River, which diverts that river just below St. Mary Lake. By a treaty arrangement with Canada the waters of the St. Mary are divided on an agreed basis and this water is being used very completely the present year. The demand for irrigation water, on account of the excessive dryness, is greater than ever before. The water is all used on a rental basis, partly through the works of the service and partly delivered to canal systems of private or cooperative companies.

On the Sun River project, Montana, the original unit on the south side of Sun River is being operated as usual. On the north side of the river where many of the settlers were attempting to secure title to their homesteads without the liability for irrigation water, which

is included in their filing papers, a series of three dry years in succession has shown that dry farming is not profitable and has revived the demand for irrigation water. Difficulties with the canal systems have been encountered on account of the unfavorable material with which they were constructed, but it is possible this year to deliver water to about 25,000 acres, and a considerable portion of this is being served on a rental basis. A beet-sugar factory would be profitable in this region.

The Lower Yellowstone project in Montana and North Dakota has been operated for years on a rental basis with only a small fraction of the lands irrigated. The neighboring lands have been for years farmed without irrigation, and though the returns from dry farming have always been less than under irrigation, the temptation to avoid the expense of water service has been so great that the project has not yet been placed on a paying basis. A series of dry years, however, has increased the demand for water and steps have been taken to form an irrigation district and arrange for permanent water rights for the lands to be included. Appropriate laws have been passed by both States, and the prospect is good for the success of the project. The demand for water on this project has been more than twice as great this year as in any previous year, and good crops are reported. The project offers favorable conditions for the location of a beet-sugar factory.

The North Platte project in Nebraska and Wyoming is one of the largest as well as one of the most successful of the reclamation projects. The Interstate unit on the north side of the river, most of which is under public notice, is largely under cultivation, and improvement is steadily extending. Drainage is being constructed, and considerable areas are yet to be relieved. On the south side of the river the main or Fort Laramie Canal and its lateral system are under construction, and water is being delivered under rental contracts. This is the region of most rapid development of anything in the service.

The Newlands (formerly the Truckee-Carson) project in Nevada is held back for two reasons. A drainage system is needed, and though some preparations have been made toward organizing a district to secure payment for this work, the State laws are not favorable, and this has not yet been successful. The other handicap is the lack of storage for the lands on the upper part of the system, but legal and other obstacles have been thrown in the way of a proper regulation of Lake Tahoe, the only available reservoir site of consequence which can serve this region. The main canals for using water have been built, but storage works are still necessary. Pending their development no further extension is feasible.

The Carlsbad project in New Mexico is gradually increasing its cultivated area, and is in a prosperous condition. Some drainage is still to be accomplished, but the water supply is ample, and results are satisfactory.

The Rio Grande project in New Mexico and Texas is being operated on a rental basis. Nearly one-half of the land is in cultivation, and is being served by storage water from the Elephant Butte Reservoir. The flat topography of the valley, the peculiar fineness of the soil, and the very wasteful use of water in the past have brought up the water table over most of the valley, and much of the land has been injured. An extensive drainage system is being installed, and is successful so far as constructed. Its prosecution, however, is greatly hampered by the lack of sufficient funds. The lateral system which has been operated for many years by the local association of irrigators is very inadequate and inefficient, and the water is wastefully used. At the instance of the water users the various works are being gradually turned over to the Government, and are being rebuilt and put in shape for efficient service. This will to some extent remedy the threatening condition of the rising water table, and is necessary for the success of the drainage system planned. The progress along this line has been successful so far, but not very extensive.

The North Dakota pumping project, which has not been operated for several years owing to failure of the lands benefited to make payment therefor, has been formed into an irrigation district and a contract made with the Secretary of the Interior assuring its operation and the payment for the cost thereof. It is being operated this year and good results are expected.

The Umatilla project in Oregon has always been bothered by drifting sand, and in some restricted localities by an extremely coarse subsoil which allows the rapid escape of irrigation water and the leaching of soil. These difficulties are being overcome to some extent and progress in cultivation is steady and encouraging. Urgent requests have been made for the Government to enlarge the project by taking over some of the private canals which have insufficient water supply and constructing a reservoir to serve them. This can not be undertaken without additional funds.

The Klamath project in Oregon and California is being gradually extended as the waters of Tule Lake recede owing to the diversion of the supply through the Government works. Drainage works are in progress and have been successful so far as constructed. Legislation is pending to permit the reclamation of the lands around lower Tule Lake, but has not yet passed. The project can not be successfully developed without this additional legislation. The irrigated land, however, is productive and the settlers generally prosperous.

The Belle Fourche project in South Dakota is growing in production and prosperity. It is a favorable location for a beet-sugar factory. In some localities the water table is rising and drainage works should be installed, but arrangements have not yet been made for the repayment of the cost. A small amount of the land under the feed canal and not served from the Owl Creek Reservoir suffers from water shortage in some years, and plans are under way for providing a small storage reservoir to serve these lands.

On the Strawberry Valley project in Utah the principal work constructed by the Government is a storage reservoir in Strawberry Valley on the head waters of the Duchesne River and the diversion of its waters through a long tunnel to the westward slope of the Wasatch range where the water is diverted from the Spanish Fork River and an irrigation system constructed. This system is being operated by the irrigators under special contract and payments of construction charges are being regularly made. In many instances canal systems already in existence are being operated by associations which have made arrangements for storage water from the Strawberry Valley Reservoir and are operating their own canal systems. There are still some water rights in the Strawberry Reservoir for sale.

Three extremely dry years—1917, 1918, and 1919—throughout a large portion of the West have broken all records for drought, and thousands of live stock and many private irrigation projects have suffered for lack of water. Dry farming has generally been a failure throughout these regions.

The Reclamation Service experienced serious water shortage on one project—the Okanogan project in northern Washington in 1918, and while there was some shortage also in 1919 it was not so great. Pumping plants were installed at Salmon Lake and Duck Lake to supplement the storage reservoirs which did not entirely fill. The additional pumping capacity and the enlargement of the reservoir hold-over capacity are the remedies being carried out.

The Yakima project in Washington includes a large system of storage reservoirs and two canal systems known as the Sunnyside unit and the Tieton unit. The project as a whole is very productive and prosperous and strong pressure is being made to secure the construction of more storage, the extension of existing canal systems, and the construction of new canals from the Yakima River and its tributaries. The excellent results obtained show that this would be a wise development. The Yakima project as a whole is one of the foremost in general prosperity and in returning the cost of this construction.

The Shoshone project in Wyoming is being gradually extended by additions to the canal and lateral systems on the north side of the

Shoshone River. The drainage system, which has been largely completed and has been very successful, is also being extended under contract with the water users in accordance with law. The lands are very productive and the project very prosperous. Preparations are being made for the construction of an additional unit on the south side of the Shoshone River for which ample storage capacity has been provided in the Shoshone Reservoir.

The value of the agricultural products exclusive of live stock produced by the Government reclamation projects during the season of 1918, amounting to nearly \$67,000,000, has been over half of the net cost of construction of all of the projects during the last 17 years. On some of the projects the 1918 production has exceeded the total construction cost, and even better results are anticipated for the current agricultural year. The results in the extension of agriculture and of home making have justified the expectations of the advocates of this activity and argue strongly for its extension, for which there is great and growing demand.

Summary of construction results.—The following table gives a concise view of the work accomplished during the fiscal year and to date:

Summary of construction results, June 30, 1919.

Settlement.—Owing to the improved financial condition of the project farmers, due to good crops and war prices, public interest in Government irrigated lands has become very keen, and the inquiries concerning future public openings showed a marked increase during the year. The widespread hunger for irrigated Government land was shown by the number of inquiries which followed the announcement of an opening of 16 farms on the Yuma project. More than a thousand letters were received, nearly every State in the Union being represented. It was necessary to hold a drawing for every one of the farms, as 724 applicants were present at the opening.

Two small land openings occurred during the year—Newlands project, 11 farms; Yuma project, 16 farms. On June 30, 1918, there were 295 unentered farm units on all the reclamation projects. On June 30, 1919, there were 133 unentered farms. During the year there were added 27 units, so that the total number of farm units entered that year was 189. The remaining unentered farms represent the poorest tracts in the projects. Many are seeped and must be drained; others are rough or badly cut by canals and ditches.

The past year was the most active in the history of the service in the transfer of private lands on the projects. The sales by original owners in whole or in part of their ranches amounted to millions of dollars, and prices of land which a few years ago was desert and worthless ranged from \$100 to \$1,000 per acre. In these transfers it was noted that many of the purchasers were from other projects whereon they had been successful, and the change was made usually by reason of a desire for a milder climate. Montana farmers have sold at good prices to Mississippi Valley farmers and have transferred to Idaho and Oregon, while the Idaho farmer has joined the numbers thronging to California. With plenty of money and experience the newcomers are valuable additions to the communities in which they locate.

Land values are constantly rising on all the projects. A notable example of this is shown in the sale of State and school lands on the Belle Fourche project last April. The lands offered, 2,124 acres, were listed for sale three years ago with no purchasers, although the prices were very reasonable and the terms most generous. In the April sale every acre was sold and the competition was so keen that the prices in every case were above the minimum set by the State. Lands which in 1916 found no bidders at \$12 to \$20 per acre sold quickly for \$20 to \$50, the purchaser in each instance assuming an obligation to pay \$60 per acre to the Government for a water right.

The demand of the soldiers for opportunities to acquire land overshadows everything in connection with settlement work, but it will

not be a wise policy to overlook the very urgent and increasing call for similar opportunities from citizens who were unable to wear the colors. Every consideration of good policy that can be advanced stresses the need of increasing greatly the acreage for settlers on all public-land projects as well as the taking up of new projects without delay. Neglect and long deferment of definite plans for rapid land development may still this hunger.

Including areas under Warren-Act contracts, served from Government works, the national reclamation policy has resulted in an annual crop production of \$100,000,000 or over from lands which a short time ago returned nothing. To it must be attributed also the establishment of more than 200,000 people in prosperous and contented homes on the land and an equal number in the cities, towns, and villages which are the result of this agricultural development. The progress being made by these communities equals that of the most prosperous regions of our country. With millions of acres of equally favorable land awaiting development and thousands of citizens clamoring for farms, it is most important that a liberal policy in providing funds to construct the necessary works should be followed by Congress.

During the coming year land openings will occur on the North Platte and Shoshone projects, and a few additional farms will be available on the Newlands project. In December, 1919, 6,000 acres of land on the Yuma Mesa will be sold at auction. The funds derived from the sale are to be used in constructing a power and pumping plant and the distribution system. These lands are described as being practically frostless and peculiarly adapted to the production of citrus fruits.

Are project settlers permanent?—In order to determine to what degree settlement on reclamation projects is permanent, an investigation was made of a number of representative projects.

Five of the projects selected for investigation, namely, Huntley, Minidoka, North Platte, Shoshone, and Umatilla, were thought to have experienced unusually trying conditions for the settlers, and one, Boise, was thought to have been quite favorable. Letters were sent to the project managers of these six projects asking the number of original settlers still in possession and the number of transfers made by other settlers, together with any proper explanations.

Although the figures are probably not infallible, they are as nearly correct as possible. The margin of error is doubtless small in any case. The chance for greatest variation is in the number given for total farm units, because these are constantly changing and subdividing.

One of the projects, Minidoka, was also checked up by consulting the tract books in the General Land Office in Washington.

Following is a tabulation from the reports received:

Project.	Settlers still in possession, or who have satisfied homestead requirements.	Total number of settlers.	Per cent of total.	Total number of farm units.	Number of settlers per farm unit.
Boise, Idaho.....	987	1,273	89.1	1,107	1.14
Huntley, Mont.....	383	839	65.0	589	1.42
Minidoka, Idaho.....	899	2,709	55.8	1,609	1.68
North Platte, Nebr.-Wyo.....	723	2,155	54.0	1,337	1.61
Shoshone, Wyo.....	405	902	66.5	609	1.48
Umatilla, Oreg.....	136	289	69.3	196	1.47
Total.....	3,533	8,167	65.2	5,447	1.49

From the figures quoted it is computed that the average number of settlers to a farm unit on the Boise project, where conditions were favorable, was 1.14, or slightly more than 1—truly a remarkable showing when it is considered that farms in general often go through many changes in ownership—and only 1.68 on the Minidoka project, where conditions were adverse.

Opponents to homestead and reclamation acts have argued that settlers take up their farms merely for speculation. Although no effort has been made to learn the changes on reclamation projects after title has been obtained, results indicate slight changes during the time of proving up.

Before the end of the period required for residence, settlers may relinquish their right and for money consideration pass on the farm unit. This can safely be done only when the relinquishment paper is filed simultaneously with another entry. Any such transaction may come under the notice of the project office if the settlers are known personally. Giving up an entry does not by any means indicate that the entryman has failed to make good on his farm. It may show quite the contrary—that he has succeeded so well that he is able to sell out his improved farm for a good figure. This kind of speculation can hardly be avoided.

The first few years of the Reclamation Service were the most severe for the project settlers. Water was not available at this time, and under the law settlers could not be prevented from taking up land which might not receive water for years. Having seen how often it worked hardship for settlers to struggle along until water was ready, the service secured the passage of a law which prohibited the entering of farm units until the irrigating system is in operation, resulting unquestionably in even greater permanence of settlers on projects opened under these conditions.

The investigation has shown conclusively in connection with Federal projects that there is not the slightest basis for the statement so often and so loosely made that “throughout the newer parts of America at least three settlers in succession attempt to develop a farm before one succeeds.”

Irrigation and crop results, 1918.—The usual census of irrigation and crop results on the Government reclamation projects, as described in previous annual reports, was continued during the period covered by the present report. Obviously such information is not adapted to fiscal years, and the figures that follow are for the last growing season or calendar year, that of 1918. On the Salt River project, Arizona, where some crop is growing at all times of the year, a convenient period is taken as the agricultural year, from October 1 to September 30, which date approximately marks the transition from the heavy summer production to the winter crops. On that project operation and maintenance of the works built by the Government have been turned over to the Salt River Valley Water User's Association, and in the following statistics of crop production the figures for that project are gathered and furnished by the association. Similarly on the gravity unit of the Minidoka project, Idaho, the Minidoka irrigation district handles the operation and maintenance and has compiled the crop data. On the King Hill project, in the same State, the data are furnished by the King Hill irrigation district. The poor showing on this project is due to the bad condition of the canal system, which was built under private auspices. The United States has undertaken its reconstruction, and this work is under way, but not sufficiently advanced to insure a good water supply to the bulk of the project. The Government has not undertaken operation and maintenance on this project, which are handled by the district.

It will be noted that these reports do not give the total value of farm products in that they include nothing from farm animals. The project census does not cover the income from livestock or stock products, but it is known that large additional returns are realized from sales of animals, poultry, dairy products, wool, and honey.

It should also be noted that the crop reports by no means cover the entire area to which water is made available and delivered from the works built by the Reclamation Service. In general these statistics are limited to those areas for which the United States has built a complete system from the point of storage or diversion to the laterals serving each farm and where the Government is operating such works, thus employing a force of ditch riders in frequent touch with the irrigators. This provides a ready means of gathering census data of more than ordinary accuracy and at little or no extra expense, since the time for collecting these coincides with that when the water deliveries are dwindling in the fall and the ditch riders, while still required for occasional deliveries, have less onerous duties in connection with the operation and protection of the system.

In addition to the tracts covered by the crop reports, there is a large and growing area dependent in various degrees on the Government works for water supply through special contracts, mainly

under the Warren Act, calling for delivery of water in bulk from the reservoirs, or at various stages of distribution to the land. This large area is not covered by the crop reports nor included in the following statistics though comparable in the aggregate to the area thus reported. The following tabulations, therefore, are merely summaries of the crop reports obtained and are so entitled; they fail to give, possibly by 50 per cent, the total production made possible by the works built under the reclamation law.

Summary of 1918 crop reports, by projects.¹

State and project.	Irrigable acreage. ²	Irrigated acreage.	Cropped acreage. ³	Crop value.	
				Total.	Per acre.

¹ Excluding substantial areas (private canals) to which water is furnished under the Warren Act. Data are for calendar year (irrigation season) except on Salt River project data are for corresponding "agricultural year," October, 1917, to November, 1918.

² Area Reclamation Service was prepared to supply water.

³ Irrigated crops. Excludes small areas on few projects cropped by dry farming.

⁴ Includes so-called "dry lands" given right to rent water temporarily on account of ample storage.

⁵ Includes about 5,000 acres within town sites, about 11,000 acres reported "vacant" and probably largely pastured, and over 5,000 acres of "home tracts" including house lots, etc.

⁶ Irrigable acreage includes New York Canal, Nampa-Meridian, and Pioneer district lands served project water. Irrigated acreage here reported is limited to area served full water supply, excluding vested right lands given partial service.

⁷ Poor results on this project are due to condition of canal system, which was built under private auspices. The United States has undertaken its reconstruction; operation and maintenance are handled by the settlers through an irrigation district.

⁸ Crop reports covered an additional area of 3,119 acres cropped by dry farming, producing crops worth \$21,619, or \$6.93 per acre.

⁹ Above figures are for 187 irrigated farms, which included small tracts farmed without irrigation. In addition, crop reports covered 7 farms operated without irrigation, on which 109 acres yielded crops worth \$1,998 or \$18.33 per acre.

¹⁰ Crop report covered an additional area of 5,345 acres dry-farmed, producing crops worth \$60,886, or \$11.39 per acre.

¹¹ New lands, first year of irrigation.

¹² For crops in full production, excluding 9,662 acres of wild-grass pasture and 3,081 acres otherwise in full production. For all crops, \$39.30.

However, a summary of the crop reports received gives some impressive figures of the values that have been secured from the desert lands by the provision of irrigation water. The following table summarizes the reports by projects, and it will be noticed that for several of these the crop values produced average over \$100 per acre. These averages are for all farms and all crops in the large tracts covered by the census, including the least successful with the most successful irrigators, and averaging with banner crops those of low yield or any of entire failure due to pests or other causes. The average returns per acre therefore are an index for a large area in each case, and far greater results are secured by many of the most skilled and successful settlers.

For all projects the crop reports show a gross value of over \$66,000,000, or an average of \$63.60 for each of the 1,050,000 acres cropped. These reports covered an irrigated acreage of 1,119,000 and 1,600,000 acres that were irrigable, i. e., for which the works were ready to supply water. This does not, however, indicate a failure to utilize 500,000 acres and the water ready for it as shown in the preceding discussion.

For the Salt River project, Arizona, the Water Users' Association reported a total crop value of over \$18,000,000. Under the contract by which the association assumed the operation and maintenance of the works and agreed to reimburse the United States for their construction, the amount fixed for the latter purpose is approximately \$10,279,000. Thus the crop value in a single year is more than 150 per cent of the construction cost the association is to repay to the United States over a period of 20 years, and most of which will be supplied by power profits from the project works.

On some of the other projects the development has reached the stage where the annual crop value is comparable to the total cost of building the irrigation works. The Minidoka project, Idaho, which cost about \$5,700,000, yielded crops in 1918 worth \$5,160,000. Prior to the Government work the project was entirely sagebrush desert. The Yakima project, Washington, costing to date about \$10,000,000, yielded crops worth \$9,733,000 in 1918.

In the following table the crop reports are summarized by crops and comparison with similar tabulations for previous years shows relatively small changes in the general character and relative importance of the crops grown. Alfalfa continues as the great basic crop, occupying 40 per cent of the crop area and furnishing one-third of the total crop value. Wheat advanced from 12 per cent in 1917 to 16 per cent of total crop area reported in 1918. The acreage in cotton on the southwestern projects doubled. Eight million bushels of

grain, a like amount of vegetables and truck, 165,000,000 pounds of fruit, and 267,000 tons of sugar beets were harvested from the lands covered by the crop reports. But over half the crop area was devoted to hay and forage crops, largely converted to animal products by feeding on the projects.

Summary of crop reports on reclamation projects in 1918.

Crop.	Acreage cropped.		Yields.			Crop value.

¹ This figure does not represent average value of pasture for a year or season, as considerable areas pastured were also harvested and are included in the duplicate area.

BUREAU OF MINES.

Purpose of the Bureau of Mines.—Established by Congress (37 Stat., 681) in 1910 for the purpose of conducting scientific and technologic investigations concerning mining and the preparation and utilization of mineral substances, with a view to the increase of health, safety, and efficiency in the mineral industries, the Bureau of Mines is studying mine gases, rescue, and first-aid training for miners, the utilization of coal and other fuels with greater efficiency, the development of ways to use domestic minerals in place of minerals formerly imported, the prevention of waste in the production, transportation, and utilization of petroleum and natural gas, and the development of processes and methods whereby deposits of minerals now unworked may become available as sources of supply. In addition the bureau during the fiscal year conducted special investigations relating to new methods of producing various substances, administered the provisions of the law controlling the manufacture, sale, possession, and use of explosives during the war, and gathered and disseminated information in regard to sources of supply of economic minerals throughout the world, the political control of these minerals, and the variations in demand at the principal markets from month to month. In the course of this work the Bureau of Mines cooperated with various departments, bureaus, and Government establishments.

Cooperative agreements.—In its endeavor to act most effectively with State agencies seeking the improvement of efficiency and the lessening of accidents in the mineral industries, the Bureau of Mines, with the approval of the Secretary of the Interior, had made cooperative agreements with State organizations and with State universities and mining schools. During the fiscal year, ended June 30, 1919, investigations relating to safety and efficiency in the mineral industries were conducted under cooperative agreements with the bodies named, as follows: University of Arizona, Tucson, Ariz.; Industrial Accidents Commission of California, San Francisco, and University of California, Berkeley, Calif.; University of Idaho, Moscow, Idaho; Colorado School of Mines, Golden, Colo.; engineering experiment station of the University of Illinois, Urbana, Ill., and Illinois Geological Survey; University of Minnesota, Minneapolis, Minn.; Ohio State University, Columbus, Ohio; Oregon Bureau of Mines and Geology; Industrial Commission of the State of Utah and State School of Mines of the University of Utah, Salt Lake City, Utah; University of Washington, Seattle, Wash.

Mine experiment and mine safety stations.—The bureau has 11 mining experiment stations, 9 mine safety cars, and 7 mine safety stations. The mining experiment stations are investigating mining and metallurgical problems; the mine safety stations are instructing

miners in first-aid and rescue methods, and in giving assistance after mine disasters. The mining experiment stations are at Pittsburgh, Pa.; Columbus, Ohio; Urbana, Ill.; Minneapolis, Minn.; Bartlesville, Okla.; Salt Lake City, Utah; Golden, Colo.; Tucson, Ariz.; Berkeley, Calif.; Seattle, Wash.; and Fairbanks, Alaska.

The mine rescue or mine safety stations are situated at Pittsburgh, Pa.; Vincennes, Ind.; Norton, Va.; Jellico, Tenn.; Birmingham, Ala.; McAlester, Okla.; and Seattle, Wash. The mine safety cars have headquarters at Pittsburgh, Pa.; Huntington, W. Va.; Ironwood, Mich.; Terre Haute, Ind.; Pittsburg, Kans.; Butte, Mont.; Raton, N. Mex.; Rock Springs, Wyo.; and Reno, Nev. The bureau also maintains four motor rescue trucks—one at Pittsburgh, Pa., one at Birmingham, Ala., one at Vincennes, Ind., and one at Seattle, Wash.

War work.—At the beginning of the year the bureau was centering its efforts on war work. In this work the bureau cooperated with the War Department, Navy Department, Department of Agriculture, United States Fuel Administration, National Research Council, United States Shipping Board, Capital Issues Committee, Council of National Defense, War Industries Board, Bureau of Standards, and with other bureaus of the Interior Department.

The work included investigations of minerals, ores, and metals especially needed, cooperative work for the Army and the Navy, and various investigations relating to fuels.

The most noteworthy undertaking was the development of a process for recovering helium, for use in balloons and airships, from natural gas. This work, begun the year before in cooperation with the War and Navy Departments, resulted in the production of 150,000 cubic feet of helium before the signing of the armistice, and demonstrated the merits of the Bureau of Mines, or Norton process, plant for the recovery of helium.

Under an allotment of funds from the Ordnance Department of the Army the Bureau of Mines designed and supervised the construction of a large plant at Saltville, Va., for the manufacture of sodium cyanide by the Bucher process.

During the year the War Department erected at Sheffield, Ala., a plant for the oxidation of nitric acid from ammonia. The apparatus in this plant, which was more efficient than any hitherto devised, was the result of experiments conducted under the direction of the Bureau of Mines, in cooperation with the Ordnance Department and the Semet Solvay Co., at Syracuse, N. Y.

War minerals investigations.—Minerals and metals especially needed during the war included manganese, chrome, tungsten, pyrite, tin, graphite, and potash. The bureau up to the signing of the armistice was examining deposits of these minerals and study-

ing methods of mining, treatment, and utilization. About 100 persons were engaged in this work, of whom about 90 were mining engineers, metallurgists, or chemists. About 60 per cent of these men were engaged in the staff and field work of the larger investigations; the rest were consulting engineers working on special problems. After the armistice the bureau continued to give attention to market conditions and to economies in treatment, with the purpose of enabling producers to meet the conditions brought about by the great decrease in demand consequent on the cessation of hostilities.

War minerals relief commission.—A rider attached to the Dent military bill (Public 322), approved March 3, 1919, authorized investigation and payment of net losses incurred by producers of manganese, chrome, pyrite, and tungsten, when such losses had been incurred as a result of Government request. The maximum amount to be expended for such relief was limited to \$8,500,000. A commission of three members is reviewing the claims and making the awards. The Secretary of the Interior authorized the Director of the Bureau of Mines to conduct the field engineering and accounting investigations, also the office routine and administrative work for the commission.

Explosives regulation.—By the provisions of the act regulating the manufacture, distribution, storage, use, or possession of explosives and their ingredients during the war (Public 68, H. R. 3932), the Bureau of Mines, under rules and regulations approved by the Secretary of the Interior, exercised wide powers. When the armistice was signed it had appointed more than 14,000 carefully selected licensing agents throughout the United States and its insular possessions, and had issued about 1,000,000 licenses. In administering the act the bureau sought to stop careless practice in the use of explosives, examined magazines throughout the country in order to prevent storage of explosives under dangerous conditions, investigated violations of the act and of outrages against life and property, and took steps to have offenders punished. After the signing of the armistice some of the regulations for carrying out the purposes of the act were made less stringent.

Regulation of platinum.—Because of the imperative need of platinum in the manufacture of chemicals and munitions and the inadequate supply of the metal, Congress by the act of July 1, 1918 (Public 181), authorized the Director of the Bureau of Mines, under rules and regulations approved by the Secretary of the Interior, to limit during the period of the war the sale, possession, and use of platinum, iridium, palladium, and compounds thereof. Because of the signing of the armistice the restrictions imposed through this act were removed by the director of the bureau, with the approval of the Secretary of the Interior, on November 14, 1918.

Administrative divisions.—For purposes of administration the technical and scientific work done by the bureau at its Washington office and at its various mining experiment stations was grouped in five divisions, as follows: Mining, fuels and mechanical equipment, metallurgy, mineral technology, and petroleum technology. Each of these divisions was under a chief who reported to the director. The work on war minerals, organized as the war minerals investigation, was placed in a separate division, as was that on explosives' regulation. Each of these divisions had its headquarters in Washington. The work done at the experiment stations was under the general direction of the supervisor of experiment stations, who had headquarters in the Washington office.

During the fiscal year the mining division conducted various investigations regarding health, safety, and efficiency in coal mining and metal mining, had charge of the training and rescue work done through the mine safety stations and cars, and supervised Federal mine inspection in Alaska and on Indian lands; the metallurgical division carried on investigations relating to the prevention of waste and the increase of efficiency in the treatment of ores and of various metals, nearly all this work being done through the experiment stations; the mineral technology division had charge of work on alloy steels and of some special work for the War and Navy Departments, practically all of the mineral technology work of preceding years being transferred to the war minerals division; the division of petroleum technology had charge of work dealing with the increase of safety and efficiency in the production, handling, and utilization of natural gas, petroleum, and petroleum products.

At the end of the year the organization of the bureau was being changed so as to have all research work segregated in a research branch and all work dealing with operation and administration routine in an operations branch.

Mine rescue and first-aid training.—Through its mine safety stations and cars, the bureau renders aid at mine disasters and trains miners in first-aid methods and the use of rescue equipment. During the fiscal year ended June 30, 1919, the men attached to these stations and cars investigated the causes of 29 mine accidents—19 at coal mines and 10 at metal mines—and trained 9,781 miners in first aid and rescue methods. Nearly 65,000 miners have received training through the cars and stations since the beginning of this work by the Government.

Mine explosions and fires.—At the experimental mine of the bureau, near Bruceton, Pa., work relating to the causes of mine explosions and methods of prevention was continued. Various explosives were tested to determine their permissibility for use in gaseous or dusty coal mines; 2 of these were approved, and the permissible

list at the end of the year contained the names of 162 explosives. More than 37,000,000 pounds of these explosives were used in the coal fields of this country during the calendar year 1918, as compared with 2,000,000 pounds of similar explosives in 1908, the year in which the testing of mine explosives by the Government began. The total quantity of permissible explosives used throughout the United States in the calendar year 1918 was 46,045,233 pounds. Explosion-proof equipment for mines was tested and approved.

Health of miners and sanitary conditions at mines.—In cooperation with the Public Health Service the bureau continued work relating to the health of miners and to sanitary conditions at mines. Especial attention was given to ventilation conditions in mines in Arizona. Owing to the need of surgeons in the Army and the influenza epidemic, the cooperative work of the Public Health Service had to be curtailed in the early part of the fiscal year. During the epidemic the crews of several of the cars rendered efficient service in caring for the sick. In the latter part of the year two surgeons of the Public Health Service, each assigned to one of the new mine safety cars of the bureau, examined miners as to their fitness for mine-rescue work, gave public lectures on matters relating to first aid, sanitation, and hygiene, made sanitary inspections at different mines and mining communities, and suggested to owners or operators the improvement of conditions so as to lessen the risk of preventable or occupational diseases.

Fuel investigations.—In its efforts to increase efficiency in the use of coal and lignite the bureau is studying the properties of these fuels and the methods of burning coal, lignite, and coke in boiler and house-heating furnaces. Also it is collecting, analyzing, and testing samples of coal belonging to or for the use of the Government. During the year the bureau assisted in an advisory capacity the Fuel Administration and various departments and establishments of the Government in solving problems relating to the efficient use of fuel for heating or power. It had charge of tests of marine boilers for the Emergency Fleet Corporation, and as a result of these tests changes were made in the methods of baffling the boilers and of admitting air to the furnace, which increased the efficiency of certain boilers 16 per cent. Toward the end of the fiscal year, under an appropriation of \$100,000 by Congress, the bureau began a comprehensive investigation of the best methods of utilizing the great beds of lignite in Texas, the Dakotas, and other States, this investigation to include the erection of a plant for carbonizing lignite and producing gas as a by-product.

Increasing efficiency and lessening waste in the petroleum and natural-gas industries.—Through its petroleum division the Bureau of Mines is investigating problems of petroleum and natural-gas technology. These problems are grouped in four classes, as fol-

lows: Production technology, including methods of preventing infiltrating water from entering oil and gas sands through wells, the determination of the ultimate production and hence the value of oil lands, the occurrence and relation of gas, oil, and water in different fields, and the preparation of refinery statistics; engineering technology, including waste of oil in storage and transportation, the prevention of gas and oil well fires; investigations of refinery practice, the recovery of gasoline from natural gas, the production of carbon black from natural gas, and economy and efficiency in the use of oil fuel; chemical technology, including the routine examination of samples of fuel oil and gasoline, the preparation of specifications for petroleum products, the inspection of gasoline for military use overseas, the character of the motor gasolines sold throughout the country, the study of cracking processes for making gasoline; and oil-shale technology, including a review of the oil-shale situation in the United States and the work being done at distillation plants erected by private concerns. In addition members of the petroleum commission served on various war-time boards and commissions, including the Interallied Petroleum Conference.

Government fuel yards.—The sundry civil act approved July 1, 1918 (Public 181), carried among the appropriations for the Bureau of Mines an appropriation of \$432,300 for the establishment of fuel yards in the District of Columbia for the use of all branches of the Federal service and the municipal government in the District of Columbia, and also an appropriation of \$1,154,088 for the purchase and transportation, storing, and handling of fuel, and the maintenance and operation of the yards and equipment.

During the year a yard with storage capacity of 20,000 tons was equipped and put in operation under the direction of the Bureau of Mines. The equipment comprises hoppers, bins, and belt conveyors. The approximate cost of the yard and its equipment was \$260,000. For distributing the coal to the various buildings in the District a fleet of 33 motor trucks was purchased. During the fiscal year 247,540 tons of fuel were purchased, 165,669 tons being handled by the trucks.

Bartlesville experiment station.—The Bartlesville station is giving all its time to problems of the petroleum and natural-gas industries. Two brick buildings for the station were completed during the year. The research work done through the station included investigation of the use of the absorption process for recovering the residual gas from compression plants for obtaining gasoline from natural gas; investigations and demonstrations of methods of preventing water from entering gas and oil sands through wells; an investigation of the manufacture of carbon black from natural gas, with regard to the possible development of more efficient methods of production; an

investigation of the loss of the lighter hydrocarbons from crude oil during storage, one of the great losses in the petroleum industry; and an investigation to ascertain a practicable method of recovering oil from emulsified mixtures of oil and water.

Berkeley experiment station.—The work of the year included various war mineral problems; problems relating to the treatment of quicksilver ores; and investigations of the volatility of metallic compounds, with especial reference to the volatilization processes of ore treatment that were being developed at the Salt Lake City station.

Columbus experiment station.—The Columbus station is situated at the Ohio State University. New quarters erected by the university for the station were ready for occupancy in October, 1918. The chief investigations for the year were as follows: Crucible-making properties of American graphites and bond clays as compared with foreign materials; physical properties and pottery-making values of American white clays as compared with imported white clays; possible development of a suitable refractory from domestic dolomite as a substitute for imported magnesite; cooperative work with the United States Geological Survey, in the investigation of clays throughout the country; ceramic-equipment design, with a view to improving the efficiency of apparatus and equipment used in ceramic industries; cooperative work with the Ohio geological survey in an investigation of the refractory fire clays of the State; spalling tests of fire brick.

Fairbanks experiment station.—The station at Fairbanks, Alaska, investigated the value of Nenana lignite as boiler fuel, and the possibility of using the lignite as fuel for a central electric-power station with transmission lines to near-by mining districts. The station also made tests of the possible recovery of gold from heavy sands remaining in sluice boxes after a clean-up; the concentration of chromite in beach sands; the flotation of molybdenite from low-grade ores, and the concentration of gold-bearing antimony ore.

Golden experiment station.—Most of the work of the Golden station is on rare metals. During the year the investigations of radium included the study of the chemical effects of radium emanation in gas reactions. Work on zirconium resulted in the preparation of samples of the pure metal and the determination of its properties. A cooperative investigation of the recovery of molybdenite from ores by flotation resulted in the development of methods that increased the recovery at the mill of the cooperating company 15 to 20 per cent. Other work on molybdenum included the metallurgy of wulfenite and the separation of wulfenite from baryte. A method was devised for commercially treating cuprodescloizite, a mineral containing lead, vanadium, and copper, and methods for treating vanadinite (lead vanadate) were investigated. Considerable work

was done on phosphorescent zinc sulphide, used with radium luminous paint, to discover the causes of luminosity.

Minneapolis experiment station.—Problems connected with the treatment of manganese ores and the production of manganese alloys received chief attention during the year. The investigations conducted were as follows: Examination of the manganiiferous iron mines of the Cuyuna Range, Minnesota; ore-dressing tests of manganiiferous ores from various places in the United States; blast-furnace practice for the production of ferromanganese and spiegeleisen; use of manganese alloys in open-hearth steel practice; the Jones process for the direct reduction of manganiiferous iron ores and recovery of the manganese; the Bourcoud process for the direct reduction of iron ores; mining methods in the Lake Superior region; analytical work on steels, slags, and alloys; and an investigation of low-grade sulphide gold ores in the Black Hills, S. Dak.

Pittsburgh experiment station.—The work of the Pittsburgh station, the largest of the experiment stations, comprised mining problems, including first-aid and rescue methods, fuel problems, petroleum investigations, and chemical research. The mining investigations included tests of the explosibility of coal dust and of methods of preventing or stopping mine explosions; tests of explosives and of electric equipment to determine their permissibility for use in dusty or gaseous coal mines, tests of geophones, or listening devices for mine rescue and other purposes; explosives research for the War Department; and tests to determine the value of T. N. T. as an explosive for engineering and industrial use. The fuel investigations related chiefly to the combustion of fuel in boiler and house-heating furnaces, heat transmission in boilers, boiler and furnace design, the use of coke as a household fuel, and the use of powdered coal. Petroleum investigations included routine analyses of oils and greases, tests of samples of gasoline collected throughout the United States, and the development of apparatus and methods for the analysis of petroleum and its products, and an investigation of the after corrosion of Army rifles. Chemical research work included the devising of methods of analyzing graphite; tests of the fusibility of ash of coal from different fields; routine analyses of coal and coke, mine gases, natural gas and fuel gases; chlorination of natural gas for the production of chloroform and carbon tetrachloride; tests of odors for use as danger signals in the compressed-air lines of metal mines; tests of gas masks and respirators for mining or industrial use; devising of portable indicators for detecting various gases; and the sampling and examination of rock dust in the atmosphere of metal mines.

Salt Lake City experiment station.—At this station, under a co-operative agreement with the University of Utah, various improvements were made in facilities and equipment and much new apparatus

was added, especially apparatus for the ore-testing laboratory. The work of the year comprised various war minerals investigations, including concentration tests of chrome, quicksilver, and manganese ore, methods of refining graphite, recovery of potash from alunite; research work on oil shales; precipitation of zinc from hydrometallurgical solutions and recovery of metals from ores by the volatilization process.

Seattle experiment station.—During the early part of the year work was mainly on war minerals investigations, chiefly concentration tests of chrome and manganese ores; during the latter part of the year regular investigations were resumed. In cooperation with the University of Washington four groups of investigations are being conducted, as follows: Coal, electrometallurgy, flotation, and ceramics. The coal investigations comprised mining methods in Washington, the causes of "bumps" or air blasts in coal mines, Alaskan coal problems, standardization of float and sink tests in coal washing, and the storage and use of pulverized coal. Electrometallurgical investigations were hampered by nonarrival of equipment for the laboratory. Work was done on the recovery of valuable minerals from ores by flotation, and methods were devised for determining molybdenum in ores and titanium, and chromium in beach sands. In cooperation with the Oregon Bureau of Mines and Geology chrome deposits in Oregon were examined and flotation tests made with a silver-gold ore.

Tucson experiment station.—The offices and laboratories were moved into new buildings of the University of Arizona, and the new metallurgical laboratory was equipped. The principal work of the station dealt with the leaching of mixed sulphide and nonsulphide porphyry copper ores. The war minerals investigations were chiefly the investigating of manganese resources and the concentration and leaching of low-grade siliceous manganese ores.

Urbana experiment station.—Investigations in progress during the year included the study of surface subsidence resulting from coal mining in Illinois, the origin and control of mine fires, the composition of coal-mine atmospheres, the occurrence of sulphur in coal, a general investigation of coal-washery practice in the Middle West with a view to the improvement of existing methods, a general study of water-gas manufacture with especial reference to the use of Illinois coal, and the possibility of making wider use of coal brasses (pyrite) in the manufacture of sulphuric acid.

Ithaca office.—The field office at Ithaca, N. Y., worked on two main problems—electric smelting of manganese ores and the preparation of special alloy steels for the Army and Navy.

Moscow office.—In cooperation with University of Idaho the Bureau of Mines maintained a field office at Moscow. The work of

this office included investigations of the treatment of complex lead-zinc sulphide and copper-iron sulphide ores with reference to the recovery of the valuable metals by differential flotation, and the treatment of antimony ores by sulphidizing followed by flotation.

NATIONAL PARK SERVICE.

The tremendous popularity of our national parks was fully attested by the unprecedentedly large number of visitors during the 1919 season, which closed about the middle of September. Freed from the restrictions against war-time travel, which had been a war necessity, the appeal of the great natural attractions of the parks was irresistible and the response spontaneous. The national parks became the cynosure of the eyes of a war-weary and hard-worked people, bent on taking a holiday where they could derive the greatest benefits. There the refreshing atmosphere of the great Out of Doors, the soothing diversion of the natural scenery, and the specific qualities of the fresh air brought mental and physical relief to hundreds of thousands. When one considers that travel to our national parks and monuments exceeded 810,000 visitors—over 755,000 to the parks and over 55,000 to the monuments—it is evident that the recreative value of the parks is a tremendous factor in the health, wealth, and contentment of the Nation.

The following tables will give an itemized review of the travel:

Visitors to the national parks in 1919.

Hot Springs	¹ 160, 490
Yellowstone	62, 261
Sequoia	30, 443
Yosemite	58, 564
General Grant	21, 574
Mount Rainier	55, 232
Crater Lake	16, 645
Wind Cave	26, 312
Platt	¹ 25, 000
Sullys Hill	4, 026
Mesa Verde	2, 287
Glacier	18, 956
Rocky Mountain	169, 492
Lassen Volcanic	¹ 2, 500
Hawaii	(²)
Mount McKinley	(²)
Grand Canyon	37, 745
Lafayette	¹ 64, 000
Total	755, 527

¹ Estimated.

² No record.

Visitors to some of the national monuments in 1919.¹

Capulin Mountain (New Mexico)-----	² 1, 500
Casa Grande (Arizona)-----	² 3, 795
Colorado (Colorado)-----	² 3, 000
Muir Woods (California)-----	² 43, 200
Petrified Forest (Arizona)-----	² 3, 000
Zion (Utah)-----	² 1, 814
Total-----	55, 309

Analysis of park-travel figures.—An analysis of these figures shows that the travel in 1919 was 67 per cent over that of 1918 and 54 per cent more than that of the previous high-water mark in park travel of 1917. An astounding increase occurred also in motor travel to the national parks. The increase of the number of cars, 95,140 in 1919 over that of 55,296 in the record year 1917, is 72 per cent. While no accurate general record is kept in all the parks of the number of tourists entering in motor cars, in Yellowstone it is found that they average about four to the car, as will be seen from the following tables for the past three years:

Year.	Number of private cars.	Number of tourists.
1917.....	5, 703	21, 263
1918.....	4, 734	17, 317
1919.....	10, 773	40, 936

With this average in mind it is estimated that about 400,000 visitors entered the parks and monuments by motor. The travelers came from every State in the Union and from foreign countries, and the motorists from every corner of the country and from Canada and Mexico. Some of the motorists visited all of the national parks of the continental west and others toured from two to five. More than half carried their own supplies and camp equipment, and they enjoyed the playgrounds in their own way.

Conventions in the parks.—Conventions in various parks during this year of tremendous travel were the cause of some overcrowding of hotel and camp facilities. It may be necessary in the future to restrict the holding of conventions in the parks until the hotel and camp facilities can be extended beyond their present capacity. The aim is first of all to accommodate the traveling public. Among the conventions held in the parks were those of the Montana Bankers' Association, in Yellowstone Park; the Washington Bankers' Association, the West Coast Lumbermen's Association, the Association of Western Confectioners, the Knights of Pythias, the Order of the Eastern Star, in Mount Rainier; and the Native Sons of the Golden West in Yosemite.

Cooperation of United States Railroad Administration.—In these large travel figures the influence of the activities of the United States

¹ No records for other 17 national monuments.² Estimated.

Railroad Administration is also reflected. During the war travel was discouraged. Soon after the cessation of hostilities, however, the administration changed to a stand just opposite to the former policy, and by judicious advertising and education of those of its employees who come in direct contact with the tourists, stimulated the patronage of the winter resorts in the South and West to unusually gratifying proportions. Later, through its passenger traffic committee, it directed its efforts toward the summer resorts of the country with special emphasis on the national parks. The promotion of park travel, of course, fell naturally to the western committee of the railroads and to the Bureau of Service, National Parks and monuments, with headquarters at Chicago. This latter bureau was well organized and prepared to perform its functions without delays when the restrictions were raised. By attractively designed and well-written national park booklets they presented a feature of their campaign that offered at once the most important inducement to travel in the parks that has appeared since the publication of the National Parks Portfolio some three years ago. The very satisfying result achieved by this bureau testifies to its great importance and the extreme desirability of its surviving as one of the institutions of the Railroad Administration whenever the railroads are turned over to private operation.

Touring and industry.—At this writing restrictions against overseas travel have also been removed. The competition of Europe for tourist travel will begin with renewed activity. We have in this country scenery that is the peer and in most instances the superior of that found abroad, but the value of tourist travel as an industry has hardly been recognized in this country. Various industries of the United States are protected as a matter of course, but what protection will the great resorts of this country have from the greatest campaign for tourist travel in foreign lands that will ever have been waged? As a nation we have failed to grasp the significance and value of the tourist industry. Every dollar of revenue received from it stays here. Before the war Americans spent in England alone about \$200,000,000 a year, and in France and Switzerland \$400,000,000. We should develop this industry, as other countries are doing, into one of our biggest economic assets.

The need of a touring agency.—To properly develop this the establishment of a touring agency is a present national necessity. It is vitally important to the Nation, and, as there is no other agency of the Government that is so interested or so closely in touch with the traveling public as the National Park Service, the agency should be established there. Such an activity could cooperate closely with the resorts of the United States, the railroads, automobile associations, highway associations, mountaineering clubs, etc. Promotive

literature bearing the stamp of approval of the department and of the National Park Service would most effectively stimulate and maintain travel in the United States, because its data would not be selfish or exaggerated and would have the confidence of everybody using it.

The national parks in the field of education.—The dissemination of information regarding the national parks and national monuments, aside from its value from a tourist standpoint, has maintained its high place in the educational field. While no entirely new literature regarding the national parks has been issued, the existing circulars for all of the parks were published in considerably increased editions. During the year 185,000 of such publications were issued and approximately 167,500 have been distributed. Mountaineering in Rocky Mountain National Park by Supt. Roger W. Toll, of Mount Rainier Park, and Wild Animals of Glacier National Park by Vernon Bailey and Florence Merriam Bailey, compiled last year, were available for distribution during the season. A new edition of the popular pamphlet, Glimpses of Our National Parks has been prepared and another pamphlet, entitled Glimpses of Our National Monuments, is in course of preparation; these will be available for next season's work. Large editions of automobile maps were widely distributed. Popular publications on the wild life of Mount Rainier National Park, the flora of Glacier National Park, and the bird life of Papago Saguaro National Monument and adjoining regions will be ready during the coming winter months. Copy for an information circular on Zion Monument has been prepared. The value of the parks and monuments for profitable summer investigations in numerous branches of scientific and historic research is more and more apparent. Columbia University has definitely opened a field of national park study as a distinct feature of its curriculum; it is conducting a course in the scenery of the national parks with special emphasis on its creation by the forces of nature that have developed the surface of the earth and are still engaged in modifying and changing it.

During the summer the University of California through its extension division established a course of lectures on national parks, which are to be given every year in Yosemite Valley. These are to be known as the Le Conte Memorial Lectures, in commemoration of the late Joseph Le Conte's devotion to the national parks and his contributions to science. The lectures were popular and well attended. The next season's series are already being printed.

Camp-fire talks, such as were given by Dr. Matthes of the Geological Survey, at popular camps in Yosemite and at the Sierra Club camp fires by Dr. J. Walter Fewkes in the Mesa Verde National Park, and by other men interested in this educational extension work

prove intensely interesting features of the education of the visitors to a real appreciation of the meanings of the natural formation in the parks. The opportunities for field laboratory work in the parks for students are unlimited and the endeavor will be to have these opportunities developed in an increasing degree from year to year.

Establishment of museums.—The museum established at Mesa Verde National Park to house relics taken from the cliff dwellings and other prehistoric buildings of the park has become one of the most interesting and enjoyable features of the reservation. In the plans for a new administration building for Yosemite Park provision was made for a large museum to be constructed with every modern appliance for effective exhibitions. In Yellowstone National Park a large room in one of the buildings selected for headquarters will be developed as a museum to house specimens of the hundreds of different objects of interest that the park contains. At the Casa Grande National Monument a collection of prehistoric implements and other relics of interest, together with a library of archeology and ethnology, has been assembled. In Rocky Mountain Park collections of specimens of wild flowers and exhibits of mounted birds and animals are attracting attention. This work promises to be of great value to the public and will create a true understanding of the historic aspects and wild life of the parks. Supplemented by the various publications put out during the year, such as *Wild Animals of Glacier National Park* and similar educational papers, the attractions and biological history of these areas will be available to the public in varied form. The Biological Survey under the Department of Agriculture, the University of Washington, and the National Park Service are cooperating at this writing in the gathering of data for popular articles on the wild life of Mount Rainier National Park, and the Smithsonian Institution is assembling data for a book on the flora of Glacier Park.

Film and pictorial service.—The National Park Service has maintained a wide circulation of pictures, films, lantern slides, and other pictorial material. The demand for these, while not as heavy as prior to the war, was still very extensive. The great interest in the national parks shown by organizations and societies is fully evidenced by the continued demands for such material. Travel exhibits of national park pictures are constantly on view in various cities. Money is needed for more material of this kind so that the rapidly increasing demand may be met. All these parks are reservations for wild animals; they contain some of the finest game preserves in the world. With few exceptions, the wild animals of the park have thrived splendidly. The open winter helped to make raising conditions good. Toll taken by poachers and the occasional results of sporadic epidemics, of course, make certain inroads each year. It is particularly

important that appropriations become available for the administration of Mount McKinley National Park in Alaska, which was created primarily to protect its splendid animal life. Complete jurisdiction of the United States over the California and Colorado parks should also be speedily effected to protect the wild animal life. It is also highly important that a number of States give attention to the establishment of game preserves adjoining the national parks, particularly in California; these are essential to the preservation of the growing herds of animals after they leave the park boundaries, and particularly in the wintertime, when cold and scarcity of food drive them into the lowlands outside of the existing park boundaries and beyond our present protective care. Unusual success was experienced in killing of predatory animals; so much so that there has already been a noticeable increase of the deer and other species that are usually their victims.

Fishing a favorite sport in the parks.—Fishing in the parks was excellent during part of the season, but the large number of tourists enjoying the sport greatly depleted the stock. Large consignments of fry were planted in practically all the parks, but this operation will have to be conducted on a larger scale in the future. The cooperation of the United States Bureau of Fisheries and some of the States in this phase of park development was particularly gratifying. Good fishing for the visiting public is one of the most appealing diversions offered by the parks, and opportunities for following this sport will be intensively improved.

Park-to-park highway.—The immense value of a park-to-park highway is becoming yearly more apparent. Where in former years relatively few communities were in favor of it, now there is a wide demand for such a connecting link between these scenic areas. Motorists find that in almost every town along the routes from their homes to the parks or between the reservations themselves a well-kept automobile camp is established which they are privileged to use free of charge. Many of these camps are adequately equipped and wood is nearly always available; of course, small charges are made in places to cover the cost of wood or other fuel. The automobile camp of the western towns and cities is now an institution and a particularly enjoyable adjunct of park-to-park travel. The first extensive park-to-park trip to be made by using the special transportation facilities provided by the Yellowstone Park Transportation Co. and the Glacier Park Transportation Co. was made by a party organized by and under the guidance of the Brooklyn Eagle, which undertook the trip in July and early August. The trip was a great success.

In connection with the park-to-park highway travel it was very interesting to note the large numbers of parties traveling between the parks on trains. While no record is available of the number who

traveled by this means, several large bodies, such as the Travel Club of America, the Massachusetts Forestry Association, and the National Editorial Association, were noted.

The Director of the National Park Service covered a number of sections of the park-to-park highway as it could be designated in Oregon, Washington, and California, between Sequoia and Mount Rainier National Parks, and found most of them to be in reasonably good condition and available as links in the national park highway system. There are many sections of this proposed system so situated as to require no special designation, but again there are other near-by routes that might be selected. Designations have been made by the National Parks Highway Association with headquarters in Spokane, Wash., with particular emphasis on the sections between Yellowstone, Glacier, Mount Rainier, and Crater Lake National Parks. The Yellowstone Trail Association at Aberdeen, S. Dak., and the National Park-to-Park Highway Association, which has its headquarters at Cody, Wyo., have designated other routes.

When the idea of an interpark highway was first suggested it was conceived as a great circular route, combining the major national parks of the West, but beginning and ending in Denver, Colo. It may, however, be necessary to make a number of alternative routes in the system and a few of what might be termed small circle tours for the use of motorists. To complete the big tour in one season will be difficult. In this connection it will be of interest to mention a conference held in Yellowstone Park on August 10 and 11, at which 12 States were represented, for the purpose of discussing ways and means of expeditiously advancing the selection and improvement of the park-to-park highway and cooperating with the National Park Service in the encouragement of travel to the parks. This conference was organized as the National Parks Touring Association to secure the "cooperation and coordination of all State and National highway associations with a view to a composite road system leading to and connecting the national parks." This organization is practically completed. L. L. Newton, of Cody, Wyo., is general secretary of the association. The men who attended this conference have had a particularly broad experience with good-roads movements in the Western States and an intimate knowledge of the requirements of the situation.

States cooperating in road building.—Some of the States are cooperating with the park administration by providing highways to the park entrances. A particularly conspicuous example of this is found in California, where Tulare County has paved the highway to Three Rivers, the junction of the entrance roads to Sequoia Park; and the State has recently passed a \$40,000,000 bond issue containing an item of \$300,000 for completing the paving of the roads to the

park line. At Yosemite Park the construction of a paved highway from Merced to El Portal is being promoted by California business men. In Oregon the State and the Federal Government are constructing a highway that will later be paved from Medford to the west entrance of Crater Lake Park, some 72 miles. Washington is cooperating by issuance of bonds to pave the entrance roads to Mount Rainier Park, and Colorado is improving the entrance roads to Rocky Mountain National Park. Montana also is doing its share, with the cooperation of several counties, in improving the roads approaching the Yellowstone and Glacier Parks; and Wyoming is rebuilding two roads leading to the south entrance of the Yellowstone. These last two States are concentrating a large portion of their highway funds on these park approaches.

Park road construction a vital necessity.—Practically no money, however, has been available for road extensions in the national parks this year with the exception of a fund provided to complete the rebuilding of the El Portal Road in Yosemite. Work on the highways within the parks has been confined entirely to ordinary maintenance and repair. In some of the parks the funds available have not been sufficient even to prevent perceptible depreciation. An appropriation of approximately \$1,000,000 a year for a period of years for extending the existing road systems of the parks is one of their most vital needs. The Government is cooperating with the States with an expenditure of millions of dollars in the building of highways, which includes at the same time a program for the development of roads through the national forests; the main scenic features of the parks should in a similar manner be placed available to the traveling public and the road systems within the parks should be developed and enlarged to accomplish this. Our motorists should at least find as good roads within the parks as they find in the approach roads to the parks which the States and counties furnish, particularly as the Government exacts an entrance fee from the automobile owners for using the park roads.

The need for paving roads is particularly pressing in Yellowstone, Yosemite, Crater Lake, and Mount Rainier. All one-way roads used for two-way travel should be widened to accommodate that double travel.

New road construction in prospect.—The National Park Service has a number of important new highway construction projects ready to be undertaken as soon as funds are provided. Surveys and estimates of cost have been made, and work can be started without delay. A transmountain road in Glacier Park to connect the east and west sides of the park is one of the most interesting, since it will connect the two sides of the park now practically separated from each other by the mountainous masses of the Continental Divide; unless a round-

about way is taken the east side of that park is isolated from the west side; only parts of this wonderful park area have been made accessible. Other projects of first importance are a road connecting the Yosemite Valley with Tenaya Lake on the Tioga Road—a road in Sequoia Park to connect the valley of the Middle Fork of the Kaweah River with the Giant Forest. At the Grand Canyon a road along the rim from El Tovar to Grand View is an immediate necessity, and the Carbon River Road along the river of that name to the mouth of the Carbon Glacier in Mount Rainier Park should be undertaken as soon as possible. In Rocky Mountain Park what is known as the Trail Ridge Y route demands recognition as an important road project. Other important road projects have been studied and planned and will be submitted for the information and action of Congress in due time. Perhaps the most important engineering project completed during the year was the construction of the new road in the Gardiner River Canyon, in the Yellowstone.

New trails.—Hand in hand with the development of roads goes the construction of new trails. Trail surveys and studies conducted by the engineering department included projects in the Grand Canyon Park and the Belly River district in Glacier Park. The allurements of the trails are strongest in the true lover of nature, and the construction of such leaders into the innermost recesses of our park wonderlands, where their glories may be enjoyed quietly and uninterruptedly, is an important part of national-park administration and development.

Accomplishments of the engineering and landscape engineering departments.—The advice these two sections are able to give in the development of the parks is of immeasurable value. In the manifold perplexing problems of road building, sanitation, construction, and water supply, the engineering department has proved its worth in the many problems covering the individual parks. The harmonizing of the necessary buildings, public and concessions, with the landscape; the correct location of all structures; the blending of design, whether buildings, bridges, or other structures, with each other and natural features of the landscape have been some of the problems that are being satisfactorily met by the landscape department. Many improvements in the location of camps have been planned, and in the construction of new hotels incidental to the tremendous demand for additional facilities, these departments are invaluable in their solution. The complex problem of a satisfactory and dignified method of marking the entrances to the park has, it is believed, also been solved by the development of plans of gateways that will be a credit to the parks. The activities of the landscape engineer go also into the details of forest improvement and vista thinning. The schemes for preserving stands of trees along highways, the clearing up of

brush and down timber along roadsides, and the elimination of dead timber in flooded lakes within parks are other problems constantly encountered in the development of the parks and falling within the landscape engineer's bailiwick. In all this work strict conservation is the guiding principle in order that the parks may be maintained in absolutely unimpaired form for the use of future generations, as well as those of our own time. The cordial cooperation evidenced by landscape men in private life who are prominent in their professions promises that the aim of this effort is true, and that the results in time will be eminently satisfactory to the most critical eye and mind.

The advent of aeroplanes in the national parks.—The feasibility of air service into Yosemite National Park was established when Lieut. J. S. Krull, flight commander at Mather Field, near Sacramento, Calif., piloted the first aeroplane into the valley on May 25, effecting a perfect landing after a flight started at Merced, Calif., and lasting 1 hour and 5 minutes. The first aeroplane to fly over Rocky Mountain National Park landed near the Stanley Hotel, at that park, a Curtiss biplane, piloted by Mr. I. B. Humphreys, being used. Although tentative proposals to operate air craft in various parks for passenger-transportation purposes have been made at various times, no definite complete proposition has been submitted. Aero transportation to, from, and between some of the parks may eventually be a popular feature in the development of tourist travel. Flying fields have already been suggested for Lafayette and the Grand Canyon National Parks.

The practicability of using aeroplanes for fire patrols over forested areas has already been proven, and arrangements for patrolling national park areas at regular intervals, particularly the Yosemite and Sequoia Parks, which are close to Mather Flying Field, are contemplated.

Creation of Grand Canyon and Lafayette National Parks.—Efforts extending over a period of many years to make the Grand Canyon a national park had their culmination in the approval by the President on February 26, 1919, of the act establishing this park. This titanic example of erosion, with its area of 958 square miles, now covered into the park system, is the most sublime spectacle of its kind in the world, and it is truly a great satisfaction to have it perpetually reserved from private aggression for the enjoyment of our people. The nucleus of an administrative force has been installed, and work will quickly be gotten under way toward opening up this wonderland to the traveling public by rail and motor. The crying need of all this section of the country is good roads. Only 440 miles distant from Salt Lake City the north rim of the canyon, at present reached by a makeshift roadway and not developed to any degree of satisfac-

tion, has a great future. The south rim of this great abyss is better known to the visiting public, due to its greater accessibility to railroads. Curiously enough, in a land where the action of water was the chief element in the carving of this tremendous chasm and where rock is available in untold quantities, the problem of securing water and of getting suitable rock for roadways is a perplexing one. With the exception of small springs of slight capacity all water is beyond convenient reach in the bottom of the canyons and the rock is too soft for road construction. Both problems will, however, be solved.

The other event of the year of surpassing importance in park annals is the establishment of the first national park east of the Mississippi, namely, the Lafayette National Park, lying on the coast of Maine, near the city of Bar Harbor. This was formerly the Sieur de Monts National Monument. Its creation was the result of the efforts of a whole-souled, public-spirited body of men, of which President Emeritus Charles W. Eliot, of Harvard, and George B. Dorr, the present superintendent, were the prime movers. In addition to its unique distinction as the first national park in the East, it has the added attraction of being our first national park on the sea.

Area of parks and monuments.—The total area of the 18 national parks is now 10,739 square miles, or 6,872,960 acres, and the area of the 23 national monuments is 1,931 square miles, or 1,235,840 acres. There is one national park on the Hawaiian Islands and one in Alaska. There are two monuments in Alaska, which are under the jurisdiction of the National Park Service, and the others are in the States west of the Mississippi. Our national parks now cover an area greater than Massachusetts and Delaware combined.

Material for other national parks and monuments.—The national-park system is not yet complete. Several new national parks should be added, and there should be some important extension to a number of the existing parks. The following are examples: Sequoia National Park should be enlarged to include adjacent areas, and the name changed to Roosevelt National Park. The Teton Mountains and the grand scenic territory of the Jackson Hole region south of the present Yellowstone National Park should be added to that park. The Diamond Lake region, in Oregon, should be added to Crater Lake National Park; Mount Rainier National Park should take in Ohanapecosh Hot Springs. The Mount Evans region, in Colorado, is desirable for inclusion in Rocky Mountain National Park, and changes to round out and modify the boundaries of Yosemite National Park will undoubtedly be desirable. Glacier National Park should be extended to the park highway now traversing the Black-foot Indian Reservation. Zion National Monument, in Utah, will undoubtedly receive national-park status during the coming year.

Bills giving the Bandelier Monument, in New Mexico, national-park status have already been introduced in Congress.

Other projects that have been mentioned for national park timber are the reservation of the Sand Dunes of Indiana, the Mammoth Cave of Kentucky, and the Great Oynx Cave not far distant from it. The Mammoth Cave is a worthy candidate for parkhood and the outright purchase of the cave is a desirable one. Furthermore, there should be a group of parks in the eastern section of the country which would include the best examples of the eastern landscapes and some of its most conspicuous natural features. Although not as rich in natural scenic wonders as the West, the East is entitled to recognition of the importance and value of the unique features of some of its areas by having placed upon them the stamp of superlative excellence which national park status conveys. While Congress has never adopted the policy of purchasing lands for park purposes, there is the precedent which authorized purchase of national forest lands in the Appalachian Mountains under the Weeks Act of March 1, 1911. Furthermore, no more noble gifts can be made to the Nation by public-spirited individuals than tracts of lands suitable for national parks and monuments. The East has already furnished its conspicuous example in the creation of its first national park.

Save the redwoods.—The necessity of saving some of the splendid redwood stands in California, which are fast being cut by commercial enterprise, demands prompt action. The Save the Redwoods League organized to stimulate interest in their preservation is doing splendid work. Bills to preserve a splendid forest of redwood trees of the species *Sequoia sempervirens* have already brought the necessity of quick action in saving these masterpieces of forest creation from the ax of the woodman direct to the attention of Congress.

Another outstanding feature in the preservation of some of our splendid scenic trees is the necessity of preserving strips of redwood and other timber along roads in building, or to be built, in various sections of the States of California, Oregon, and Washington. Nothing should be left undone to achieve this vital result. Even though short-sighted commercialism can not see the value of this, posterity's thanks will be inevitable for even the slightest effort made toward this end. Here is opportunity for cooperation of the most public-spirited sort.

Appropriations.—Due to war-time exigencies, appropriations for national parks, as in other lines of public endeavor, were cut to the bone. The appropriation for the fiscal year 1920 for the national parks and monuments, exclusive of the Hot Springs Reservation, which is self-supporting, amounted to only \$754,195. Developing the

national parks to a standard commensurate with their dignity and importance to the Nation, and to meet the demands made upon them by an appreciative, enthusiastic people requires larger appropriations. The tremendous wear and tear which the roads and trails and other improvements suffered under the great influx of tourists requires ample funds for maintenance and repair. With increasing travel, or even with a future average yearly travel meeting this year's figures, the expansion and development of roads and trails and other facilities to relieve congestion by distribution of visitors must also have attention. Larger crowds mean larger administrative expenditures. In this connection it is of the utmost interest to know that the revenues derived from all of the parks and reservations during the past fiscal year amounted to \$196,703.03.

Forest fires in the parks.—The past year has been particularly serious from the standpoint of forest fires. Glacier and Yellowstone National Parks suffered heavily, the demands of fire fighting at the height of the tourist season taking not only the services of men urgently needed for construction and maintenance work but funds for fighting these fires had to be taken from existing park appropriations, when they could ill be spared. Money was used that was badly needed to perform work that would benefit the traveling public, and which should have been done this season. The necessity for providing a general fire-fighting fund for the national parks to be available in any park in which fires happen to occur is obvious.

Yellowstone National Park.—Congress in granting to the National Park Service absolute control of this park's affairs made possible the great progress of this year. On the withdrawal of the military forces and abandonment of Fort Yellowstone the administration of the park was reorganized. Former Assistant Director Horace M. Albright, of the park service, was made superintendent in June, 1919.

All travel records of this park were broken, the visitors numbering over 62,000. The larger portion of these came in automobiles from every State in the Union. The result was that the hotels and camps became crowded, but the acute shortage of sleeping quarters became serious only in times of storms, when thousands of camping motorists sought shelter. Camp Roosevelt, at Tower Falls, will be greatly expanded, making four large hotels and five permanent camps available to the public next year. But these will have to be further extended to meet the growing tourist demands. Many tourists brought their own equipment and supplies during the greater part of the season, and it is estimated that from 5,000 to 6,000 people enjoyed motor trips over the road system each day. This means that extensive motor camps must be provided. Plans now prepared call for over 50 large camp grounds, reasonably near the park roads.

The elk herds are in danger because of drought injury to the winter range, and winter feeding grounds are necessary. The road system is in fine repair, but the tremendous increase in travel makes necessary extensive improvements, widening of certain sections, renewal and installation of bridges, culverts, etc. New telephone and telegraph lines are also needed for protecting the park from fires, the dispatch of public business, care of emergency calls, and accommodation of tourists. Ranger stations and snowshoe cabins are greatly needed; the former, built many years ago for housing of troop detachments, are now impossible, and the latter, used by patrolling rangers in the dead of winter, are worn out, poorly located, and detrimental to health.

Attention is again called to Mr. Mondell's bill (H. R. 1412) which would add part of the Jackson Hole country, including the Teton Mountains, to the park. Besides the reasons that have been advanced heretofore for adding this region, which belongs to the Federal Government, it would provide a southern entrance, which is much needed.

Foreseeing heavy tourist automobile travel, and realizing the possibilities of connecting Yellowstone and Glacier National Parks, the "Geysers to Glaciers Highway" was organized and promoted during the season just closed, by citizens of Montana. The entire State became enthusiastic in the work of road repair—in some towns all business houses closed while their owners worked on the highways. Another development of the season was the operation of an automobile passenger service between the parks via the "Geysers to Glaciers" route. Passengers were carried to Helena, where they were transferred to cars of the Glacier Park Transportation Co., and taken northward. To care for this new volume of travel Helena is planning the erection of an enormous resort hotel. Train service between Yellowstone and Glacier was also heavy, enough so to warrant the establishment of through sleeping-car service between these two parks. The Yellowstone-Glacier Bee Line Highway will be open next season, and will be popular, both because it is a short route and a scenic one.

Glacier National Park.—Notwithstanding drought and forest fires in this park visitors increased 108 per cent. The small crew of workmen employed for protection and improvement of the park had to be diverted to the fighting of the fires, and essential park funds had to be used for this purpose.

There is a growing tendency for visitors to spend longer vacations at the hotels and chalets, and on camping trips. All this created a demand for saddle horses which at times made an acute shortage. Tourists are becoming increasingly desirous of seeing the northern valleys of the park, and both horse and walking trails are much needed. A definite road construction program is ready as

soon as money is appropriated for this purpose. Montana has continued to give some aid in the maintenance of the road up to the North Fork of Flathead River.

While visiting the park this summer members of the Brooklyn Eagle party subscribed over \$1,100 for the improvement and repair of the road between Babb and the Canadian line, in order to give our park system a connection with the highways of Alberta. The people of Montana and Alberta have called this highway "The Brooklyn Eagle Trail."

A new telephone system is needed as a fire protection and aid to administration of the park and transaction of business with the hotels and transportation lines. The irrigation works are now in operation, and the expected havoc has taken place.

The wild animals are flourishing since the predatory kind have been reduced, and fishing is becoming better each year.

Yosemite National Park.—Travel to this park began earlier than usual, and the volume was sustained to the end of the summer season, making a new record for itself. The realization by the public that Yosemite Park possesses more attractions than just those of the great valley came faster than the administration and business interests expected, so that facilities for accommodating the crowds were severely taxed. Fully half of these visitors were cared for in the great automobile camps, which are a very popular feature of the park.

Emergency improvements were necessary this year, but a new building program must be put in operation. The Yosemite National Park Co., composed of business men of San Francisco and Los Angeles, contemplates immediate improvements to the extent of \$300,000, and it estimates that to care for the travel that is certain to come to Yosemite National Park next year, improvements should be made aggregating \$1,500,000. This includes the building of a new hotel and camp on the floor of the valley, further improvements in the sanitation system, and water supply of Glacier Point hotel, and building of a camp on the Tuolumne Meadows. The lunch camp in Mariposa Grove has proven a great accommodation.

The completion by the State highway commission of a paved road to the gates of the park, promoted by California business men, will when it is completed, make it necessary for the Government to pave the new El Portal Highway and the road system of the valley floor. The proposed Yosemite Valley-Nevada Falls-Tenaya Road must be built, in order to give quick access to the Sierra section of the park and relieve traffic congestion on the floor of Yosemite Valley. It will cost approximately \$500,000 and take several years to complete. As soon as the new all-year road is completed, the winter sports of this park, now enjoyed in a limited way, will become increasingly popular. Half Dome is now scalable; the Sierra Club contributed

a protection for the trail to its top, consisting of a row of iron posts set in the rock, and through which stretches a double cable. A trails development plan is now being worked out with the assistance of the Sierra Club.

Fishing has been excellent, and the State fish and game commission is prepared to build the new hatchery as soon as authority is obtained. The importance of game preserves on the western boundary is again mentioned, as the deer, which are plentiful, need better protection. California has ceded to the Federal Government the protection of the fish and wild animals of the park, to take effect when Congress accepts this tender.

Important cooperative work was performed by the United States Public Health Service in combating the mosquito evil in Yosemite Valley, and making a survey of the sanitation needs of the park. The result of this survey indicates the entire sanitation system of the valley must be rebuilt immediately.

Among the signs of progress is the educational use of the park. This year the Le Conte Memorial lectures were delivered under the direction of the extension division of the University of California; they are to be a park institution, to continue indefinitely. Animal life is also being studied under the direction of Dr. J. Grinnell of the Department of Zoology. To make a detailed survey of Yosemite Valley, the Geological Survey has detailed a topographic engineer, and the Bureau of Entomology has continued to give extensive assistance in controlling insect pests that are attacking the forests in certain parts of the park.

Sequoia National Park.—Proposed legislation to add to this park about 1,300 square miles of scenic area and to change its name to Roosevelt National Park has made the public familiar with this Greater Sequoia project. The suggestion to rename this park in memory of the late former President came from a member of the Boone and Crockett Club, of which Mr. Roosevelt was the founder. The future of this park depends so much on the outcome of the enlargement project that development work is being retarded. The public camps present a problem as to control, sanitation, and water supply. Two new road approaches are borne in mind—one from a point on the Middle Fork of Kaweah River near Hospital Rock to the Giant Forest road system, and the continuation of the road between Sequoia and General Grant National Parks. The first approach road would require approximately two years to construct. Automobile transportation service to the park will be better and more extensive next season.

The destruction of trees all along the Pacific coast and highways of the northern part of the State emphasizes the value of the recent purchase of the Giant Forest by the combined action of Congress

and the National Geographic Society, thus preserving it from the fate of the related forests of the north.

General Grant National Park.—This park, which is steadily growing in popularity, may be one of the main gateways if not the principal entrance to the Roosevelt National Park when this reservation is established. The private lands of a lumber company, on which there are several large stands of sequoia trees and which have been offered to the Government, include the gift of Sequoia Lake, which adjoins General Grant National Park. The 160 acres of privately-owned land within the borders of this park should be acquired by the Government at the value of the property and improvements.

Mount Rainier National Park.—Travel to this park exceeded that of 1918 by 25 per cent, there being 55,232 visitors. This park was a particular attraction to eastern tourists. Hotels and camps were filled to capacity and the week-end congestion of former years was augmented. Paradise Valley was the favorite headquarters for tourists, and extensive housing facilities will be added there to meet such demands for years to come. Anticipating the Labor Day crowds 500 Army blankets were procured from Camp Lewis by permission from the Secretary of War, enabling the park administration to meet this unusual demand. This is an example of the fruits of cooperation between Government departments in the interest of the people. The guide service was particularly successful in contributing much to the enjoyment, enthusiasm, health, and protection of the tourists. Seven large conventions were held in the park during the season, besides which several mountain-climbing clubs pursued their sport there.

The deer are not flourishing because they are not protected in their feeding grounds. A State or county game preserve should be established. An extensive biological survey is now in progress, publication of the results of which will add to the natural history series of the National Park Service. The Longmire property, an eyesore for many years, has been leased by the company now owning the other hotels of the park. The Carbon River region should be opened up next, to relieve the congestion of travel, and after this has been done a hotel will be erected by the concessioners.

A broad scheme of road development has been worked out, which should be executed as promptly as possible. The White River Road should be improved, the Carbon River Road completed to the Glacier, the Carbon and Nisqually Roads connected, and the road between Glacier Basin and the Carbon River completed. The only trail built during the year ascends Klapache Ridge north of St. Andrews Creek and continuing to St. Andrews Park. Mount Rainier National Park should be extended to take in Ohanapecosh Hot Springs, which

would add only a narrow strip to the park, but would mean much for the benefit of the public.

Crater Lake National Park.—The outstanding features of the past year in this park are the completion, after several years' work, of the road around the rim of the lake, and the transfer of the engineering projects from the control of the Corps of the Engineers of the Army. This transfer will permit of future progress in all the parks in accordance with a uniform policy. Trails were built this year from the Rim Road to Sun Notch and Crater Peak. Because of the character of the natural surfaces the maintaining of good roads has been difficult. Experience, however, has taught that an oil-bound macadam road much more satisfactorily withstands travel demands than does water-bound macadam. If Crater Lake National Park is to be developed as a resort for motorists, approach roads must be rebuilt or repaired. State and Federal aid funds are now available and this improvement should be rushed to completion.

The hotel service at Crater Lake Lodge was better than last year. In August nearly 400 members of the National Editorial Association arrived in the park, taxing the hotel's facilities beyond its capacity. However, the chambers of commerce of Ashland and Medford, together with the park superintendent, contributed tents and blankets, making the excursionists fairly comfortable for the one night they spent in the park.

Senator McNary, of Oregon, has introduced a bill providing for the addition of the Diamond Lake section to Crater Lake National Park. A road connecting the Diamond Lake country with the Rim Road would be a simple matter, and with the aid of State and county authorities, from a point south of Crescent on the Central Oregon Highway, a new entrance into this park could be developed. Camping facilities around Diamond Lake are excellent.

Mesa Verde National Park.—Some permanent improvements have been completed, the most important being the new road ascending the Mesa Verde from the east side of Point Lookout. There are still wonderful sections of the park which are inaccessible. Two new highway routes—one following the higher or north rim of the Mesa and the other running south from Spruce Tree Camp, connecting with the Cortez-Shiprock Highway—would open up exhibits of ancient architecture.

Archaeological work which for lack of funds had to be abandoned in 1916 was resumed this year, Congress having appropriated sufficient money to undertake the repair of Square Tower (Peabody) House, which has been in danger of collapse. Dr. J. Walter Fewkes, Chief of the Bureau of Ethnology, is engaged in restoring this structure to a state of security. Excavations of the ruins in this park should be continued systematically, in the interests of the traveling

public and the science of archæology and related sciences, thus attracting students from all parts of the world. A few miles west of the park, on the edge of Montezuma Valley, are the Aztec Springs ruins, which have been deeded by Mr. Henry Van Kleeck, of Denver, to the Federal Government for a national monument. As the name Aztec is a misnomer and often confused with the ruin near Aztec, Mexico, it has been proposed to call this monument Yucca House National Monument. The Yucca plant grows abundantly there, and the name is commonly used by the Indians.

Grand Canyon National Park.—It is interesting to know that the first bill to make the Grand Canyon a national park was introduced June 5, 1885, by Senator Benjamin Harrison, of Indiana. The Grand Canyon has been a national monument since 1908 and has been administered by the Forest Service of the Department of Agriculture. By act approved February 26, 1919, this wonderful area was elevated to national-park status under the Department of the Interior. As there was no field organization ready, the administration of this park was not taken over by the National Park Service until August 15, when an acting superintendent was appointed. A ranger force was speedily established and the organization is now in full working trim.

The imperative needs of the park are roads and the development of a comprehensive trail system. Chalets and camps should be constructed on the north rim of the canyon and other places, as well as on the south rim. Automobile tourists are increasing in numbers, and suitable camp sites, including garage and repair-shop facilities and tourist supplies, will be laid out and developed as quickly as possible. One of the problems is the securing of water which, on the south, rim, is at present brought in by railroad from Del Rio, about 125 miles distant.

The park area is particularly rich in archeological and prehistoric material, valuable from a scientific standpoint, but is as yet for the most part unexplored.

Travel to the park this year indicated that even with its present facilities its attractions are irresistible and, with the intensive development of the park for the use of the public it will increase by leaps and bounds.

Rocky Mountain National Park.—In 1917 and 1918 Rocky Mountain National Park held the record for tourist travel to the big scenic parks of the West, but this season it takes first place in the entire park system as a tourist resort, passing Hot Springs by 9,000 and reaching a total of 169,492. All of the hotels were incapable of meeting the public demand. With the cooperation of hotels outside of the park adequate accommodations might be provided if guests would stay two or three days, but they came to spend a long time in

the park. Accommodations in and near the park were reserved for the remainder of the season very shortly after they opened. As winter sports are also enjoyed there, it seems destined to become an all-the-year-round park.

The limit of annual appropriations to \$10,000, in force until now, has prevented proper protection to its natural features from fire and other destructive agencies. Legislation repealing this inhibition is, therefore, the most important event of the year in this park, not excepting the gratifying increase in its travel. Larger developments are now possible. Game must be protected in both summer and winter; a machine shop, a stable, a storehouse, and a garage must be erected and equipped; and road, trail, and other machinery and tools be procured. Existing roads must be improved; also numerous trails and several important links in the telephone system. Work on the transmountain road connecting Estes Park and Grand Lake, known as the Fall River Road, is being pushed by the State and will be completed by July, 1920, if labor conditions and weather permit. Outside of the park the State of Colorado is expending large sums of money improving the Big Thompson and South St. Vrain approach roads.

A bill providing for the addition of the Mount Evans region to Rocky Mountain Park was introduced during the last session of Congress. This proposed addition covers 160 square miles, abounds in animal life and has a wide range of plant life. Commercially it is worthless, aside from certain grazing lands which are now, and always should be, preserved as a range for game. Denver is extending its road system to Mount Evans, and has agreed to acquire all the private holdings in the park region necessary for administration and improvement purposes.

Mount McKinley National Park.—Although Mount McKinley National Park was established in February, 1917, as an emergency step in the preservation of the great herds of wild animals of that region, Congress has not yet provided any funds for carrying out the provisions of the organic act. The small appropriation allowed the Territorial government for game protection of the entire area of Alaska does not permit of care of the park. As a game preserve it is almost comparable with Yellowstone National Park, and is in much more danger of the hunter because of its distance from civilization. It is not the policy of the National Park Service to immediately open this park to tourists, the preservation of its animals being of first importance. With the work on the Alaska railroad resumed and soon to reach the vicinity of the park, the menace of unprotected grows more threatening.

Lafayette National Park, Me.—This, the first national park in the East, was until February 26, 1919, administered as the *Sieur de*

Monts National Monument. These 5,000 acres upon Mount Desert Island were first acquired through the efforts of President Emeritus Charles W. Eliot, of Harvard; George B. Dorr, of Boston; and others, and in 1913 offered to the Government. Additional land has been given to increase the area to about 10,000 acres. It has varied natural attractions, besides its location on the ocean front, and is easily reached by rail or motor. •

Mr. Henry Lane Eno, ornithologist of Princeton University, has been placed in charge of the bird life, and Mr. Edward L. Rand, of Boston, secretary of the New England Botanical Society, of the plant life. Mr. Charles W. Johnson, curator of the Boston Natural History Museum, and an entomologist of note, is studying the insect life. These men serve for a nominal compensation.

The congressional appropriation of \$10,000 is being used for protection of its wild life, maintenance of old trails, development of new ones, minor improvements, and surveys for future development. During the coming year ranger camps will have to be established for protection of the wild life, discovery of forest fires, and guidance of visitors. In the season just closed 64,000 visitors came to the park.

Platt National Park.—Lack of funds has prevented more than the bare maintenance of existing improvements in this park. As Antelope and Buffalo Springs became suddenly dry in January, 1918, and have not resumed their flow, the sinking of wells has become necessary. Citizens of Oklahoma have subscribed funds for transporting elk from Yellowstone National Park and buffalo from Niobrara Reserve, and as there are a few deer, numerous smaller mammals and birds, this park has possibilities as a game preserve.

Sullys Hill Park.—This game preserve has been maintained by the Biological Survey since 1915. This year Congress made an additional appropriation of \$5,000 for improvements necessary for the protection of the game and comfort of visitors. A proposed Sunset Highway along Devils Lake and running through the entire park would stimulate travel there.

Wind Cave National Park.—A tremendous increase in travel marked the year's activities at this park, improved transportation facilities and proximity to transcontinental highways being largely contributable. The park has been well maintained; the game preserve therein, which was established in 1912, has 4,160 acres under fence and is prosperous.

Hot Springs Reservation.—The Government had no building site at Hot Springs that seemed suitable from the standpoint of convenience and economy for the free bathhouse and new administration building, funds for which had been appropriated by Congress—\$140,000 from the Treasury and \$50,000 from the revenue fund.

When a location was discovered that would meet requirements the citizens of Hot Springs purchased the site (block 82), and title to the same is expected to be transferred to the United States as soon as legal processes will permit. The building fund has been reappropriated by Congress and made available for the fiscal year 1920.

Instead of a new administration building, the present structure will be remodeled to harmonize with the other buildings. Three new bathhouses will also be erected on the reservation front to replace the present Magnesia, Ozark, and Lamar bathhouses, ordered to be demolished at the end of this season. These will be built at the expense of the lessees.

Caring for the indigent people who come to Hot Springs for treatment is still an important housing problem. The citizens of the city have rendered a national service in assisting this class of visitors; but this call of humanity should also have a national response.

This park is growing rapidly in popularity, over 160,000 persons having visited it in the course of the year. The number of paid baths was 729,997, an increase of 25,022 over 1918. Total receipts for 1919 were \$346,974.46, a gain of \$14,183.34 over 1918. Net profits, however, decreased somewhat, due to the greatly increased cost of operation. The 1919 season profits were \$127,476, while for 1918 they were \$127,911. The Government free bathhouse supplied 87,040 baths, the Leo N. Levi Memorial Hospital, 5,445. Altogether there were 824,326 baths taken at the reservation during the season, an increase of 21,501 over last year.

Spring flowers approximating 15,000 bulbs were planted last December in certain sections of the reservation under the supervision of a landscape architect and afforded pleasure to the winter visitors. The effort made during the consideration of the last sundry civil bill to change the name of this reservation from Hot Springs Reservation to Hot Springs National Park was unsuccessful, but another effort will be made to present the merits of the proposal to Congress.

Lassen Volcanic National Park.—Although made a national park by Congress in 1916, this area is still administered by the Department of Agriculture, no funds having been provided for the National Park Service to assume control. A certain amount of grazing has been permitted, which has been entirely in the hands of the forest rangers. An office should be established and existing improvements maintained and others arranged for, unless it is the intention of Congress to no longer consider it as a part of the national park system, in which case it should be withdrawn and made a national monument. It has been suggested that in the park-to-park highway plans a fascinating tour could be made from Crater Lake National Park to Yosemite National Park by way of Klamath Falls, the lava beds, Lassen Volcanic National Park and Lake Tahoe. During the past

two years Lassen Peak has been quiescent, the last eruption observed being that of December 3, 1917.

Hawaii National Park.—Although no funds for the administration of this park have been available, the small appropriation made by Congress for inspection and continued negotiations for acquisition of private lands were effectively utilized, the Director of the National Park Service making a personal investigation of the park last spring. All lands on the west side of Kilauea Crater belong to the Government, but are wholly unfit for development as camp or hotel sites because of the noxious fumes. The lands not affected by these fumes are held in private ownership and are the areas necessary for park purposes. Before any appropriations for the improvement of Hawaii National Park can be made the private holdings necessary for the administration and operation of the park must be secured, together with the rights of way for roads and trails. An inhibition in the organic act establishes this situation. All private holdings in the Mauna Loa Park area have been acquired, and at the first opportunity the survey of a road to connect the Kilauea area with the summit of Mauna Loa will be undertaken. The Maui Chamber of Commerce has built a comfortable concrete rest house in the Haleakala Park area. The volcano of Kilauea has been quite active during the year.

Zion National Monument.—This monument is proposed as a national park, and as soon as this is accomplished certain extensive improvements should be made. Utah has continued its work of constructing permanent improvements on the highways leading to the monument, and if the suggestion to develop Arrowhead Trail from Salt Lake City to St. George is carried out, travel to Zion National Monument will increase greatly. Figures show that more people visited the monument this year by motor than by rail. Prehistoric dwellings have been discovered during the past summer, located only 4 or 5 miles from the entrance to Zion Canyon.

Muir Woods National Monument.—A water system which includes a reservoir has been installed. Mr. William Kent, who in 1908 donated to the Federal Government this tract, is now arranging to convey to the Government another tract of beautiful forest land, for the purpose of enlarging this monument. This tract will include Steep Ravine, which is not far from the Pacific Ocean. In event it is decided to exclude automobiles from these woods it will be necessary to construct an adequate parking space immediately below the reservation, which the owner has tendered for use as a parking area. This arrangement will offer increased advantages as a camping and picnic ground to visitors. Trails, both for use of visitors and as fire-patrol routes, are needed, also a cottage for the custodian.

Chaco Canyon National Monument.—Excavation and restoration of some of the ruins of this monument are being undertaken by the Smithsonian Institution, the School of American Research, and the Royal Ontario Museum of the University of Ontario. A permit has been granted to Dr. Clark Wissler, of the American Museum of Natural History to conduct archaeological investigations at the Pueblo Bonito. The building of the dam and other work necessary to restore the ancient but comprehensive irrigation system will be done by the National Park Service.

Gran Quivira National Monument.—A proposal has been made to extend this monument to include the adjoining tract with the School of American Research purchased from private holders for purposes of preservation and scientific study. Some excavations are in progress by the School of American Research.

Petrified Forest National Monument.—Situated near both a trans-continental railroad and an automobile highway, this monument was visited this year by a large number of travelers. The improvement and repair of a section of the highway through one of the principal forests was the chief work done during the year. Besides the maintaining of good roads, a bridge is needed over the Rio Puerco between Adamana, the railroad station of the monument, and the north line of the reservation. A ranger is needed to prevent depredations.

El Morro National Monument.—The problem connected with this monument is the protection of the historic inscriptions from vandalism. Due to the work done on the Grand-Inscription Rock Road, the State of New Mexico is improving the Ramah-Gallup Road. The marking of trails, placing of warning signs, and opening up of the spring at the base of the rock for visitors, are other improvements borne in mind for early attention. Improvement of roads is bound to bring larger numbers of visitors.

Tumacacori National Monument.—Although established in 1908, not until this year were funds available for repairs on the old mission building. Mr. Frank Pinkley, custodian of the Casa Grande National Monument, who was last year made custodian also of Tumacacori National Monument, without additional compensation, directed numerous repairs on the structure. In this work Mr. Pinkley was assisted by the Chambers of Commerce of Nogales and Tucson, Ariz., and the archaeological department of the University of Arizona, the latter headed by Prof. Byron S. Cummings. These institutions also subscribed funds for a portion of the restoration work.

Dinosaur National Monument.—Continued investigations and excavations of this monument are being carried on by Dr. W. J. Holland, of Carnegie Institute of Pittsburgh.

Casa Grande National Monument.—Considerable important but inexpensive improvement work was accomplished here during the

past year, namely, the clearing of débris and growth of brush, the building of a well, and the providing of picnic grounds, and parking areas for automobiles. The archaeological work undertaken consisted of preparation for investigations of these buried ruins. The study of an elliptical mound leads to the conclusion that the building within was used as a stadium by the ancient inhabitants of the village.

Navajo National Monument.—Work of repairing Betatakin (Hill-side House), a remarkable example of cliff dwelling, was completed last year, under the management of Neil M. Judd, of the National Museum, as field officer. These ruins are to Arizona what the ancient villages of Mesa Verde are to Colorado; and, like the latter, will continue to draw an increasing number of visitors each year. The task of restoring these historic ruins is not difficult, and is a matter of great importance.

Montezuma Castle National Monument.—This monument is in poor condition, and repairs should be undertaken to prevent further deterioration. A resident custodian is needed, but only a nominal sum is available for his services. There is considerable public interest in this monument.

Katmai National Monument, Alaska.—The four expeditions of the National Geographic Society to this region in 1918, which were followed this year by the largest exploring party yet sent out by this society to the region of Mount Katmai and the neighboring valley of Ten Thousand Smokes, more than justifies the creation of this natural wonder area into a national monument. The scientific harvest was unexpectedly large; and, as thousands of feet of film were brought back, the public will have an opportunity to become acquainted with the scenic wonders of this unique region. The discovery of an abundance of fish and game increases the qualifications of this monument as a national park of the future.

Devils Tower National Monument.—The road leading through the monument to the base of the tower was repaired, and the spring at the base of the monument developed to provide drinking water for campers and tourists visiting this natural curiosity.

Lewis and Clark Cavern National Monument.—Because of its inaccessibility it was thought best not to open this cave to the public until it has been made easier of approach and funds have been made available to compensate a resident custodian. This is necessary to prevent depredation. It is under the supervision of the superintendent of Yellowstone National Park.

Shoshone Cavern National Monument.—The trail to Forst's Cave in this monument was finished and offered numerous tourists an opportunity to visit this cavern. Its attractions will furnish an interesting side trip from Cody or the eastern approach to Yellowstone Park.

Sitka National Monument.—Of great interest to Alaskans was the repair of the 18 totem poles on the monument. The highest of these is 60 feet. In addition, seats were placed at prominent points on the island commanding good views of the particularly numerous scenic attractions of the neighborhood. The monument is located only 1 mile from Sitka.

Other national monuments.—Nothing of particular note has transpired in or near these areas; they either do not require extensive improvement or are not susceptible of development except at great expense. These reservations are the Pinnacles National Monument, California; Natural Bridges and Rainbow Bridge National Monuments, Utah; Colorado National Monument, Colorado; Papago Saguaro National Monument, Arizona; Capulin Mountain National Monument, New Mexico; and Verendrye National Monument, North Dakota.

THE TERRITORIES.

Since the transfer under Executive order of July 15, 1909, of the supervision of affairs in Porto Rico to the Insular Bureau of the War Department, the former Territories of New Mexico and Arizona have been admitted as States, and there now remains under this department the supervision of but two Territories—Alaska and Hawaii.

ALASKA.

In the report of the governor for the fiscal year ended June 30, 1919, a strong plea is made for the withdrawal of governmental restrictions on development and for assistance in opening up the Territory to more extended commercial activity. The governor expresses the appreciation of the Territory for what has been done heretofore, but urges still greater assistance so that Alaska can be placed on a greater revenue producing basis. In particular, he draws attention to the lack of Territorial police protection, the closing of industries due to high freight rates and the inadequacy of appropriations.

During the year the Territory has suffered from flood, fire, famine, sickness, and death. Floods have caused great destruction in Seward, Juneau, and Nenana; fire has wiped out a large part of the business section of Fairbanks and, due to the epidemic of influenza, a large proportion of the native population of the Seward Peninsula received relief through Territorial agencies.

The most serious of these disasters has been the scourge of influenza. Following the lines of steamer travel, early in October, influenza broke out in practically all the coastal towns. Travel to the interior was stopped and so escaped an outbreak there. Had the epidemic reached the native and white settlements of the Yukon, the

mortality would have undoubtedly been high, as pneumonia is very fatal in the intense cold.

It is estimated by the assistant commissioner of health for the second division and the officials of the bureau of education that there have been 1,500 deaths, chiefly among the natives on the Seward Peninsula and vicinity. Particularly in Nome and on the peninsula was the epidemic most severe. Whole villages of Eskimos lost their entire adult population. The bureau of education, in charge of the natives of Alaska, was powerless to render much assistance on account of a lack of funds. The governor was asked to take charge of the situation. Medical relief was given where possible, destitution was relieved, and the orphan children gathered up and placed in institutions until appropriations should become available for their permanent care. The Public Health Service rendered aid to a limited extent in the matter of employing physicians and nurses. After the worst of the epidemic was over the American Red Cross lent some financial assistance and sent nurses and physicians north on the naval collier *Brutus*. The bulk of the authorizations, however, were unprovided for. The burial of dead natives alone cost approximately \$20,000. A bill was introduced in the Senate appropriating \$100,000 for Alaskan relief and passed that body but failed in the House. Items attached to the sundry civil and deficiency bills also failed of passage in the House. As a last resort, the governor appealed to the Territorial legislature and received an appropriation from its treasury of \$70,000 for the relief of the native wards of the Federal Government and \$23,000 for whites—this in addition to some \$18,000 or \$20,000 already expended from various other Territorial funds.

Two hundred and thirty-eight orphans, so far reported, are practically all that are left of an Aleut and half-bred population of between 800 and 1,000.

Consolidation of governmental authority.—Attention is drawn to the great confusion existing in Alaska over conflicting departmental authority. There are as many as five different organizations building and maintaining roads on small appropriations; fish canneries must deal with three different departments; game animals are under the jurisdiction of the Department of Agriculture, while fur-bearing animals are under the Department of Commerce; and the settler on forest reserves is always faced with delay on account of the dual authority of the Department of Agriculture and the Department of the Interior. Birch wood, needed in the manufacture of furniture, may be exported from forests, but not from public lands, where the best stands are found. There are reservations and withdrawals administered by no less than seven executive departments. The governor advocates the centralization of all possible authority in the Department of the Interior and then the further centralization of all

bureau authority in Alaska itself, thus making an effective government, responsible to but one chief. There could be then but one territorial budget and one overhead administrative organization.

Police protection.—The great need of the Territory is police protection; there are 4 United States marshals and 55 deputies, including the office deputies. The marshals are technically process-servers and a preventive force. There are 30 or 35 wardens of various bureaus. The governor recommends that all police power be consolidated in the establishment of a uniformed constabulary, patterned after the Pennsylvania Constabulary or the Royal Northwest Mounted Police of Canada. The officers should be given the powers of justices of the peace. Two hundred men of a constabulary scattered throughout the Territory, with travel equipment suited to their particular locality, could perform all needed police work. They would be available not only for police duty, but as quarantine officers in case of epidemic and for rescue service. At present there is a battalion of troops in Alaska, which could be withdrawn and a constabulary substituted therefor.

Naval patrol.—On account of the beneficial results of the former naval patrol, the governor requested that it be continued throughout the year 1919. The gunboat *Vicksburg* and the submarine chasers were returned to Alaskan waters in May and have been most energetic in their activities. The *Vicksburg* rendered splendid service in the Aleutian Islands and in the vicinity of Bristol Bay during the outbreak of influenza in May and June of this year. The *310*, stationed in Prince William Sound, quieted what bid fair to be a serious disturbance between the white and native fishermen at Yakutat, and the *309* has rendered similar service at Klawock. At present the patrol is taking active steps to suppress fish piracy, which has been engaged in more than ever before.

There should constantly be stationed at Juneau a naval or Coast Guard vessel, available for rescue work in case of shipwreck and for cooperation at all times with the Federal and Territorial authorities; during the summer season there should be at least four of the smaller craft on constant duty. So far the results have been invaluable, particularly in the absence of other police power.

Population.—During 1918 the population of Alaska reached its lowest ebb. Vessels reporting to the customs showed an excess of departures over arrivals of 9,909 persons. At the close of the calendar year 1918, taking the customs-house figures into consideration with the census of 1910 and the vital statistics available, the white population barely exceeded 30,000. The governor believes that during the years of exodus (1916, 1917, 1918) fully 10,000 additional people left on small craft, Government ships, transports, and other unreported boats, so that the actual population probably did not ex-

ceed 20,000. The number of persons voting at the election of 1918 seems to bear out this hypothesis. For the first six months of 1919 the excess of arrivals over departures, as reported to the customs, was 11,588, but this figure includes a great number of cannery employees, perhaps five or six thousand, who return to the States at the close of the fishing season. The governor estimates the white population at the end of the fiscal year 1919 to have been about 32,000.

Mineral production.—The value of the mineral output of the Territory in 1918 is estimated at \$28,253,961, a decrease of almost \$12,500,000 from the value in 1917 and the smallest since 1914. The decrease was chiefly in copper and gold and was due to a shortage of labor and ships and high cost of mining. There was an increase of more than 60 per cent in the production of mineral fuels and a slight increase in chrome ore; the only new item among mineral products in 1918 is palladium. Since 1880 Alaska has produced gold, silver, copper, and other minerals worth more than \$418,000,000.

Alaska mines produced gold to the value of about \$9,480,952 in 1918, compared with \$14,650,000 in 1917. The total value of the gold mined in the Territory is now about \$302,000,000, of which \$213,000,000 has been from placers. In 1918 about 69,224,951 pounds of copper was produced, valued at \$17,098,563. The production in 1917 was 88,793,000 pounds, valued at \$24,240,000. The total copper produced to date is 497,786,565 pounds, valued at \$105,743,033. The value of lesser mineral products in 1918 was as follows: Silver, \$847,789; coal, \$411,850; tin, \$118,000; lead, \$88,088; miscellaneous metallic products, including chrome ore, tungsten, palladium, platinum, and antimony, \$96,100; and miscellaneous nonmetallic products, including petroleum, marble, gypsum, and lime, \$120,619.

The governor draws attention to the fact that mining in Alaska has never before been conducted under such adverse conditions. The gold placers, heretofore the backbone of the industry, are the principal sufferers. Wages, costs of equipment and supplies, high rates of transportation, shortage of labor, together with the depletion of the known rich deposits, have all conspired to reduce not only the production of placer gold, but have also prevented contemplated development of the lower grade deposits. For similar reasons, the great low-grade lode mines of the Gastineau Channel have not been able to operate at any marked profit, although all modern devices for reducing costs are being employed.

Copper.—Owing to the lack of transportation during 1918 and governmental demands during the war for the higher grade copper ores, practically none of the low-grade copper mines were enabled to continue normal shipments, to the great distress of the operators.

During the first six months of 1919 the low price of copper was another deterrent feature.

Coal.—In the matter of coal, once more transportation becomes a prime factor. There must be an export outlet; it is probable that trans-Pacific coal-burning ships will find it advantageous to establish a coal supply in the Aleutian Islands not far from the "Great Circle" sailing routes between Puget Sound ports and the Orient. A naval base in Alaska will demand coal in quantity, which can best be supplied from our coal fields. The opening up of the coal fields and their connection with rail and water transportation will eventually result in the building of a smelter on Prince William Sound whereat all the ores of the district can be reduced. When this happens, many of the lower grade mines, not now workable to profit, will become active producers.

Petroleum.—It seems probable that Congress will enact laws at this session which will permit the development of oil fields which are known to be of value. Under existing law, all oil fields are withdrawn from either entry or lease. It is noted that the oil production and consumption curves have crossed and, if for no other reason than to help reduce the exorbitant prices now paid for oils, every encouragement should be held out to the developers of the fields.

United States Geological Survey.—A suboffice of the United States Geological Survey was opened at Anchorage on July 1, 1918. Its function is to maintain headquarters throughout the year for a resident geologist to work on special problems connected with the mining industry of the region and also to serve as a center from which to distribute survey publications and maps and to collect mineral statistics. The establishment of this office marks the further endeavor of the department to assist in the industrial development of the Territory and should become an important factor in the expansion of mining, more particularly along the lines of the Government railroad.

The Alaska Experiment Station of the United States Bureau of Mines at Fairbanks is one of ten similar stations conducted by the bureau throughout the country, the others being located in different mining States. The object of the station is to render every possible assistance to prospectors, miners, and operators; to conduct experiments and disseminate information with a view to increasing efficiency, preventing waste and safeguarding working conditions in mining. The establishment of the station will result in undoubted good to the Territory and is appreciated.

Fisheries and fur-bearing animals.—The fishing industry has now become probably the most important industry of coastal Alaska. Canneries, salteries, cold storage plants are springing up on every hand, but it is feared that the enormous catches of late years will

soon result in a noticeable depletion of the fisheries. There have always been lean years and fat years, but the lean years are becoming more lean and the fat years not so fat. Attention has been brought by those not particularly interested in the conservation of our sea resources to the fact that more and more fish are being yearly exported, but they do not draw attention at the same time to the greater number of fishing devices, the larger and more numerous craft engaged in the trade, the deadly floating trap and the practically uncontrolled stream fishing. 1918 was a banner export year.

The salmon pack for 1919 will probably not exceed 50 per cent of that of 1918. Streams which a few years ago teemed with spawning salmon, now appear almost barren.

The governor favors the transfer of the entire conduct of the fisheries to the Territory, so that governing laws may be enacted by men familiar with local conditions. The money available for the work of the Bureau of Fisheries is so inadequate to the purpose that even the limited number of boats and men employed can not operate throughout the entire season. As a consequence, laws and regulations supposed to control almost every operation are continually being violated by both cannery men and independent fishermen.

If the transfer of the fisheries to the Territory can not be effected, the governor advocates a most liberal appropriation for the protection of Alaska's fisheries and this can be done without loss to the Government, as the revenue derived by the Federal Government from the sale of seal and fox from the Pribilof Islands, from confiscated beaver and marten skins, from by-products of the seal rockeries, are many times in excess of all moneys spent on the fisheries in Alaska, and as additional protection is afforded, so will additional revenues be collected.

Starting with the month of June, the robbing of fish traps and the intimidation of watchmen constituted a menace to cannery operations. Apparently a well organized conspiracy existed for the illicit brailing of traps and for the disposal of the plunder. It was estimated that at least twenty boats were engaged in the unlawful practice. After considerable delay, during which time the fish pirates were particularly active, authority was received from Washington to proceed energetically. Launches and special deputies were employed and several arrests were made. The Territory, by extending assistance to the Bureau of Fisheries, was able to obtain needed evidence. The naval patrol was actively engaged at all times and rendered valuable preventive service. Fish piracy, for this year, at least, has been broken up.

In the session of the territorial legislature held in the spring of 1919, bills were passed providing new and increased taxation upon fisheries products, creating the territorial fish commission, pro-

hibiting the pollution or obstruction of salmon streams, and establishing the office of labor commissioner, among the duties of which is the inspection of canneries and fishery establishments in regard to sanitary aspects of their operation as affecting laboring classes.

In the fiscal year 1918 there were released from the privately owned hatcheries 23,712,000 red salmon fry, for which, at the rate of 40 cents for each 1,000 fry, the owners were entitled to a rebate of \$9,484.80 in Federal license taxes on canned product.

In the season of 1917-18 the total number of young red, or sockeye, salmon liberated was 90,390,200, of which number 66,678,200 were released from Government hatcheries. In the calendar year 1918 the take of red, or sockeye, salmon eggs at Government stations was 101,981,000 and by privately owned hatcheries 40,020,000. In the same period there were also taken 10,062,000 humpback-salmon eggs by Government hatcheries and 3,660,000 at one of the other hatcheries.

The number of persons employed in the fisheries in 1918 was 31,213. Of these, 17,693 were classed as whites, 5,251 as natives, 1,509 as Japanese, 2,734 as Chinese, 1,338 as Filipinos, 1,709 as Mexicans, and 979 as miscellaneous. The total number in 1917 was 29,491, or 1,722 less than in 1918.

The total investment in the fisheries in 1918 was \$73,764,289, of which \$63,901,397, or approximately 86 per cent, was invested in the salmon-canning industry. The investment in 1918 was greater than in 1917 by \$18,826,740. Of the 1918 investment, approximately \$34,500,000 was in southeastern Alaska, \$14,250,000 in central Alaska, and \$25,110,000 in western Alaska.

The total value of fishery products in 1918, exclusive of aquatic furs, was \$59,099,483; the value of the 1918 products exceeded by \$7,632,502 that of 1917, which was \$51,466,980.

A very material increase occurred both in quantity and value of products in the salmon industry in 1918. As in previous years, the value of the output was several times that of all other fishery products combined. In 1918, for the first time salmon were taken commercially to a considerable extent in the Yukon River.

In 1918 the total number of salmon taken was 101,454,688. The take by species was as follows: Coho, or silver, 2,911,681; chum, or keta, 14,160,818; humpback, or pink, 48,316,362; king, or spring, 727,762; red, or sockeye, 35,338,065. The total take in 1917 was 92,600,495, or 8,854,193 less than in 1918.

The value of the output of canned salmon in 1918 represented about 95 per cent of the value of the total products of the salmon industry. The investment in the salmon-canning industry amounted to \$63,901,397, of which \$28,971,126 was in southeastern Alaska, \$11,960,681 was in central Alaska, and \$22,969,590 in western Alaska. The total investment in 1917 was \$46,865,271, or \$17,036,126 less

than in 1918. The number of persons engaged in 1918 was 26,502, an increase of 3,152 over 1917.

The halibut industry dropped from second to third place in 1918, the value of the product being exceeded by that of the herring industry. In 1918 the investment in the halibut industry was \$2,607,792; in 1917 it was \$2,200,987, or \$406,805 less. The number of persons employed in 1918 was 1,186. The total production of halibut credited to the Territory was 13,869,706 pounds, valued at \$1,667,686.

In 1918 there was a great expansion in the herring industry as a direct result of the exploitation work of the Bureau of Fisheries in 1917 to introduce the Scotch-cure method. This work also indirectly stimulated the operations of those who continued to use the Norwegian method. The output of herring was second in value only to that of the salmon industry in 1918. In 1918 the investment in this industry was \$1,802,817, as compared with \$562,002 in 1917, a gain of 220 per cent. The number of persons employed was 884, and the value of products was \$1,819,538; the value of the output in 1917 was \$767,729.

Other industries are the mild-curing and pickling of salmon, the cod, sablefish, whale, and shark fisheries and the packing of clams, shrimps, etc.

Fur seal service.—Commercial killing of fur seals was resumed on the Pribilof Islands in the season of 1918. There were taken on St. Paul Island 27,503 sealskins and on St. George Island 7,387, a total of 34,890 skins for the calendar year of 1918.

Two sales of dressed, dyed, and machined fur-seal skins from the Pribilof Islands were held at St. Louis in 1918. On April 22, the number of skins sold was 6,100, and the total price bid was \$271,945, the average per skin being \$44.58. At the sale on October 7, the number of skins disposed of was 2,000, and the total price bid was \$103,440, an average of \$51.72. The total number of skins sold during the year was 8,100, and the total amount bid at the two sales was \$375,385.

Another census of the fur-seal herd was taken in 1918. The results showed a substantial increase in the size of the herd over the previous year, and were in keeping with the general upbuilding of the herd since the cessation of pelagic sealing several years ago as the result of the North Pacific sealing convention, effective December 15, 1911. A total of 496,431 seals were enumerated.

Territorial fish commission.—The territorial legislature of 1919 provided for the creation of a fish commission and the establishment of a hatchery. For this purpose the sum of \$80,000 was appropriated. Part of this appropriation is being utilized in clearing obstructions from salmon spawning streams. All employees will be

appointed ex-officio Federal fish wardens to assist in maintaining the fishery regulations and to secure better cooperation with the Federal authorities.

Agriculture.—Many parts of Alaska contain land on which farming can be successfully followed, provided markets can be procured for the products. In the Tanana Valley farming has long since passed the experimental stage. In the Matanuska Valley splendid results, particularly with vegetables, have been obtained. In southeastern Alaska vegetables and the small berries are grown. Particularly near Fairbanks does one find well laid out and productive farms. There are 93 homesteads in the district, totaling 22,613 acres.

A small flour mill has been bought for the Department of Agriculture experiment farm, and many of the farmers are availing themselves of the opportunity of grinding flour from their own wheat. In a few years the Fairbanks district will be enabled to furnish wheat for the entire Yukon Valley.

The governor suggests that legislation be passed to enable the Department of Agriculture to distribute beef and milch stock to the farmers on long-time payments.

To assist the farmers, good roads should be furnished. The condition of both the Territorial and Federal road funds is such that the entire appropriations are now needed for maintenance and little new work can be undertaken until larger sums are available.

Public lands.—The records of the Surveyor-General's office show that during the fiscal year ending June 30, 1919, 18 townships, whole and fractional, were approved; 11 on the Seward meridian and 7 on the Fairbanks meridian.

There have been surveyed in Alaska, to this date, 134 townships, whole and fractional; 82 on the Seward meridian, 39 on the Fairbanks meridian, and 13 on the Copper River meridian.

During the present season surveys are being made along the Cook Inlet coast of the Kenai Peninsula, north of Kachemak Bay, and in the Chilkat Valley in southeastern Alaska.

The governor recommends the reorganization of the general land office in Alaska so as to have one office in the Territory that can speak authoritatively. In the present system every land claim becomes practically the subject of consideration by four different branches of the bureau. The governor suggests that this can be done in one of several ways; as a start the office of the surveyor general can be abolished with a considerable saving to the Government, and his duties delegated to either the supervisor of surveys or to the chief of the field service, to be handled with a minimum office force. The surveyor general is ex officio secretary of the Territory. At least these two offices should be separated and the latter office be filled

either by presidential appointment or made elective. There is nothing in common in the two positions.

National forests.—There are two great national forests in Alaska, the Chugach, comprising 5,417,852 acres, and the Tongass, comprising 15,449,717 acres. On May 2 and August 16, 1918, 199,680 acres were temporarily withdrawn from the public domain near Lituya Bay.

The governor does not believe in national forests for Alaska. He states that it is true that a certain amount of money is spent on roads and in cooperative agreements for roads, but if the same provisions could be made to cover public lands, the whole country would be better off. Those interested in the possible manufacture of pulp tell him that the industry would have undoubtedly been established in Alaska, if definite terms covering a period of years could have been arranged for, and if the water powers were not subject to a lease revocable at any time. In his last annual report, he suggested that there is no function performed by the Forest Service which could not be performed by the General Land Office.

The total receipts for the Tongass and Chugach National Forests for the fiscal year ended June 30, 1919, were \$102,813.71. The total cost of administration of the two forests for the same period was \$43,454.14.

The total number of applications received for forest homesteads on the Tongass Forest is 245, eight of which were received during the past fiscal year. The total number of applications received for lands within the Chugach National Forest is 407, only three of which were received during the past fiscal year. Patent survey is made by the Forest Service free of charge for all national forest homesteads just as soon as the applicant has complied with the homestead law.

There are at present 580 occupancy permits in effect on the Tongass Forest. Among the many users are 55 canneries, 69 cabins for which no rental is charged, 4 cold-storage plants, 320 residences for which an annual nominal rental fee is charged, 24 salteries, 8 sawmills, 1 whaling station, and 7 fox ranches. There are 159 occupancy permits in effect on the Chugach National Forest covering free agricultural uses, canneries, fox ranches, salteries, residences, herring pounds, etc.

On the Tongass Forest there were a total of 429 timber sales made, covering 42,295,000 board feet of saw timber and piling, and 38,403,000 board feet were actually cut during the fiscal year. On the Chugach there were 93 sales, covering 5,349,650 board feet; 6,360,990 board feet of saw timber and piling were cut during the fiscal year. In addition to the timber sold on the Chugach the Alaskan Engineering Commission cut approximately 5,758,000 board feet under free use.

The area of the Chugach Forest was reduced by 307,800 acres. This elimination was effected through presidential proclamation dated April 16, 1919. The areas eliminated include a strip of land 3 miles deep from Kachemak Bay to the Kasilof River, and the larger portion of the surveyed land in the vicinity of Anchorage, containing a considerable portion of land suitable for agricultural purposes, as determined by an extensive reconnoissance survey conducted by the Forest Service.

National park and national monuments.—Alaska has one national park (the Mount McKinley) and three national monuments. The park, of approximately 2,200 square miles, has as the central attraction Mount McKinley, 20,300 feet in elevation, the highest known mountain in North America. Its northern slopes embrace some of the greatest breeding grounds of game in Alaska, where it is no unusual sight to see herds of woodland caribou of from 200 to 1,000 animals, and sheep in bands of several hundred, while moose and bear are found in more limited numbers.

The Sitka National Monument, near Sitka, the old historic capital of Alaska, lying along Indian River and the bay, is one of the most beautiful spots in all Alaska. The reservation embraces 57 acres and contains a number of splendid totem poles which, through neglect, were rapidly falling apart. A small allotment of funds by the National Park Service has enabled the custodian to repaint and repair those poles which were in the worst condition. These totems it will be impossible to replace and they should be carefully guarded.

The Katmai National Monument, a reservation of approximately 1,700 square miles, surrounds the volcano, Mount Katmai, which "blew its head off" in 1912 and deluged the surrounding country with ashes.

The monument at Old Kasaan embraces 38.3 acres and contains some wonderful totems which, unless cared for, will soon disappear. The monument, which is under the Agricultural Department, is entirely neglected and seldom visited.

The Government railroad.—This project is covered under the heading "Alaskan Engineering Commission," page 53. The governor makes most favorable comment thereon and urges that appropriations therefor be made available so that uninterrupted progress can be made on construction. He states that it is very probable that even after completion the railroad will not immediately operate at a profit, but the deficiency will be more than offset by the new and taxable industries established along the route. Alaska has proved immensely profitable to the Government along the lines of established transportation. The country along the railroad will prove no exception.

Alaska insane.—Under a contract with the Secretary of the Interior the legally adjudged insane of Alaska are cared for at the

Morningside Hospital near Portland, Oreg., the contractor being the Sanitarium Co. The present contract expires on January 20, 1920. A new five-year contract with the same company has been executed, at a price of \$41.25 a month per patient, which, in view of the rapid rise in the price of supplies, equipment, wages, etc., will be entirely inadequate. Twice since the signing of the armistice it has been necessary to raise salaries. In addition to the hardships encountered by the contractors due to high costs, beginning January 1, 1920, under a ruling of the labor commissioner for Oregon, three shifts will be required in the nursing and attending staffs. Steps should be taken to afford relief to the contractor so that the inmates of the sanitarium may not suffer in any manner.

Commerce.—The total commerce of Alaska with the United States for the fiscal year was \$117,018,835, as compared with \$131,767,788 for 1918, or a decrease of \$14,748,953. The more important increases and decreases are as follows: The increase in the export value of sea-food products was \$5,144,171; the decrease in the value of copper shipped was \$5,978,824, while the export of domestic and foreign gold and silver from Alaska for 1919 amounted to \$9,308,119, as compared with \$15,134,879 for 1918, a decrease of \$5,826,760.

On imports from the United States the following increases and decreases are shown: Increase on coal, \$33,835; decreases, lumber, \$212,820; liquors, \$414,755; iron and steel, including hardware, \$4,764,759; breadstuffs, \$461,895. The total decrease in shipments from the United States to Alaska amounted to \$8,736,041.

Imports from foreign countries amounted to \$1,334,403 and exports to foreign countries of \$1,074,367, which, added to the total commerce of Alaska with the United States, make the grand total commerce of Alaska for the fiscal year 1919 reach the sum of \$119,427,605, as compared with \$135,115,025 for 1918.

Transportation.—Chiefly due to war conditions, transportation to and in the Territory during the past year has been in a most chaotic condition. Steamers have been unable to maintain schedules and in many instances have entirely cut out former ports of regular call. A great hardship was worked particularly in many of the districts off the regular lanes of traffic.

The Prince William Sound ports during the winter were intermittently served by the two large steamship companies—the Alaska Steamship Co. and the Pacific Steamship Co.—with three regular ships. These had but small passenger traffic and little northbound freight, although full cargoes southbound, principally of ore.

The industry of the Territory is seriously menaced. As a matter of protection, the legislature of the Territory enacted a law creating a shipping commission, consisting of the governor, the secretary of the Territory, and the treasurer, empowering them to investigate traffic conditions and, if no remedial results can be procured, to

even go to the extreme of establishing a territorial steamship line, it being considered that to protect the industry of the Territory, it might be best to operate such transportation line even at an annual loss.

Federal roads in Alaska.—The Alaska Road Commission, constituted by act of Congress approved January 27, 1905, is composed of three officers of the Army, who report to the War Department through the office of the Chief of Engineers.

The total expended for all construction and maintenance to June 30, 1919, is \$1,920,655.67. Of this amount \$2,920,000, or 59 per cent, was appropriated at different times by Congress, and \$2,000,655.67, or 41 per cent, from the Alaska fund. One thousand thirty-one miles of wagon road, 673 miles of sled road, and 3,223 miles of trail have been constructed and maintained since 1905. Approximately 400 miles of wagon road has a light gravel surface.

The appropriation granted for 1920 is \$100,000, amounting to an allowance of \$20 per mile, which makes it impossible for the commission to take care of the ordinary maintenance, and also makes it necessary to defer maintenance on a great many roads which are of great importance to the people of the Territory.

Territorial roads.—The road law enacted by the last legislature provides for the closest cooperation between the Territory and the Federal road authorities, and when full advantage is taken of the provisions of the law, most satisfactory results should follow.

In addition to roads constructed and maintained through Federal agencies, the legislature appropriated \$375,000 for the biennium ending March 31, 1921. Under the provisions of the new road law, the apportionment to the road districts of the four judicial divisions may be expended under cooperative agreement with Federal agencies.

The Territory has partly constructed and wholly maintains 241 miles of wagon roads and 232 miles of pack or sled trails. Winter trails are staked across the tundra for the safety of travelers and relief cabins are erected where travel is dangerous.

Natives of Alaska.—The governor suggests that an Indian policy for Alaska should consist of, first, the elimination of communicable and hereditary diseases, and, second, training the young in useful trades within the Territory itself. Unless the native is made healthy and decently self-supporting, religious and scholastic education is, to a great extent, waste effort. The governor thinks that it is not demanding too much to ask that the Alaska natives have as much spent on them per capita as do the Indians of the States, and given equal consideration in proportion to numbers, in the establishment and maintenance of schools and hospitals. The Alaska natives will gradually become a considerable factor in the industrial development of the Territory. He draws attention to the fact that in addition to the expenditures by the Bureau of Education, the Terri-

tory is spending annually about \$30,000 for the education of natives and half-breeds.

Alaska native school service.—The schools for native children in Alaska are supported by Federal appropriation under the supervision of the Bureau of Education of the Interior Department. The Territory is divided into five districts, each in charge of a superintendent of schools directly responsible to the chief of the Alaska Division of the bureau, whose headquarters are in Seattle. The Seattle office also functions as a purchasing and disbursing office for the service.

During the past year, 65 schools were maintained with a total enrollment of approximately 3,600, the highest monthly average attendance being 2,750. The enrollments in individual schools range from 12 to 169. Primarily because of the difficulty in securing suitable teachers, 6 of the schools operated the previous year were not opened. In spite of undeniable increases in costs of all kinds during the war, the bureau's appropriation for the education of these children during the past year was but \$215,000, an increase of only \$15,000 over the \$200,000 received in 1907 and each successive year. Obviously the bureau not only must reduce its expenditures for supplies and materials to the lowest possible figure in order to maintain the school system established but is also very much handicapped in attempting to meet the increased salary schedule necessary to the efficiency of the personnel.

The necessity for enlarging the work among the natives of Alaska has annually been set forth in reports to this office. The immediate needs may be summarized as follows:

An appropriation for education of not less than \$350,000 with which to meet the increased cost of operating the present school system and to provide school facilities for districts of Alaska which the bureau has been unable to enter for financial reasons.

A power schooner for use in making delivery of supplies to the stations during the open season of navigation and to be used as a training ship in seamanship as part of the education of young natives in southern Alaska.

Several trade schools in Alaska to enable promising young natives to complete their education under environments to which they are accustomed. Under present conditions, it is necessary for them to enter schools in the States, with the usual result of impaired health and making them unfit to return to their old environments.

A reimbursable fund with which to establish industries in native communities. The success the bureau has already had along this line shows what might be done under proper supervision. The native people can and will repay any loans of this nature, and industrial enterprises among them will not mean competition with the whites, but rather the development of native resources.

Alaska native medical service.—The ideal arrangement, of course, would be to have a sufficient number of small hospitals, physicians, and nurses so that professional care for serious cases would be within reach of all the stations of the Bureau of Education. With an annual appropriation of but \$75,000 this can not be done. Under these financial limitations the bureau has been enabled to establish, operate, and maintain a complete hospital at Juneau of 20-bed capacity, an 11-bed hospital at Kanakanak, Bristol Bay, a similar sized one at Akiak on the Kuskokwim, and small hospitals in charge of a physician and one nurse at Nulato on the Yukon and at Kotzebue. Contract physicians were also employed at Ellamar, Cordova, Hoonah, and Nome. In addition to the nurses employed in the hospitals mentioned above, a nurse was stationed at each of the following places: Metlakatla, St. Michael, and Wales. Such a staff is absolutely inadequate to the requirements of the Territory, as was evidenced during the influenza epidemic which made such terrible inroads on the native population. The natives of Alaska are peculiarly susceptible to epidemics, and not only from a humanitarian standpoint should they be protected, but in the economic interests of the Territory should the native races be safeguarded.

During the present summer a hospital is being erected at Noorvik on the Kobuk River. It will be practically a duplicate of the Akiak Hospital, and will accommodate about 12 patients besides providing quarters for the staff.

An excellent start has been made in the medical work among the natives of southeastern Alaska, which district, however, is but a very small part of the Territory. The Bureau of Education should have an appropriation of at least three times the present one in order to provide for the needs of the natives in other parts of Alaska. Unless their physical well-being is adequately attended to, the educational efforts for the natives are of doubtful permanent value.

Alaska reindeer service.—Until 1892 Alaska had no reindeer. In that year and for 10 succeeding years, 1,280 deer were imported from Siberia. To-day there are in the neighborhood of 125,000 reindeer in Alaska. The primary object of the introduction of reindeer was to make the natives of Alaska economically independent. By a system of apprenticeship a native serves for four years in learning to care for the deer and receives 6, 8, 10, and 10 deer for the first, second, third, and fourth years, respectively. At the end of his apprenticeship he is a full-fledged herder and assumes charge of his herd. After his herd attains sufficient size, he in turn is required to take on an apprentice. Thus the system of distribution among the natives is perpetuated, and any native desirous of owning deer can either acquire them in this manner or can purchase them from another native.

So complete has been the distribution among the natives that at the present time the Government holds title to less than 3 per cent of the deer in Alaska. Seventy per cent are owned by the natives, while 5 per cent are held by the missions in Alaska for the benefit of the natives. The remainder is owned by Laplanders and whites. The Bureau of Education appropriation last year of \$6,000 was used entirely in the completion of the distribution of deer among the natives. Through lack of funds the bureau is consequently handicapped in working out problems in connection with marketing the meat. The industry has now reached proportions where an outside market is imperative and the present area of high meat prices makes this the opportune time. Some efforts along this line have been made by the white owners and the present year should show considerable progress. However, several kinds of diseases have developed. Warble flies infest many of the deer and make the skins practically worthless, and the stock in many herds has deteriorated as a result of inbreeding.

To assist in these and other problems peculiar to the reindeer the Bureau of Education has employed a veterinarian with headquarters at Shaktoolik in the Norton Sound country who will give his entire attention to reindeer matters. This is an immense step in the right direction and it is hoped the bureau may be able to place similar specialists in other reindeer sections and that much good may result to this important industry.

Relief measures.—Biennial appropriations are made by the legislature to cover the following relief measures:

Rescue and relief of lost persons.....	\$10, 000
Pioneers' Home.....	107, 200
Allowances for aged pioneers.....	40, 600
Dependent children.....	12, 000
Relief of destitution.....	15, 000
Total.....	184, 800

The above total does not include an appropriation of \$93,000 and the unexpended balances of other appropriations for relief authorized by the governor during the three epidemics of influenza, 90 per cent of which expense was incurred among the natives and should have been borne by the Federal Government.

Ten per cent of the Alaska fund is expended for the relief of destitution by the United States district judges of the four judicial divisions. This in 1918 amounted to \$21,962.10.

Game and game laws.—Probably due to loss in population, game seems to be on the increase throughout the Territory. Coyotes, however, have worked their way up through British Columbia and have entered Alaska by way of the White River. Wolves are greatly on the increase.

The governor again draws attention to the fact that the game laws are ill-advised and can not be enforced, especially with an appropriation which is entirely inadequate. He suggests that the jurisdiction over the game and fur-bearing animals be transferred to the territorial legislature. The governor entirely approves of the migratory bird treaty, but considers that the open season for killing birds should be advanced in Alaska and the Yukon territory, as practically all migratory birds have left the interior of Alaska by October 1.

"Bone dry" Alaska.—During the fiscal year there were 91 arrests made by the special officers for the suppression of the liquor traffic among the Indians, for violations of the liquor laws, 78 convictions and 13 acquittals. Fines, amounting to \$8,410 were collected and jail sentences aggregating 1,168 days were imposed. Other arrests were made by the marshals of the several judicial divisions and convictions obtained which are not included in the above.

Under an annual appropriation by the Government of \$15,000, there are four special officers for the suppression of the liquor traffic among the Indians employed—one in each of the judicial divisions. To properly enforce prohibition, this appropriation is absolutely inadequate; the distances are too great, the expense of travel too heavy. Very little real whisky is now coming into the country, but the resourceful bootlegger is distilling his own "hootch" in neat stills which can be set up on a kitchen stove. Some of the stills captured are marvels of ingenuity. The product of these illicit stills (commonly known as "White Mule," on account of its color and powerful "kick") is vile in the extreme and most injurious to health. If prohibition is to be thoroughly enforced, there must be more officers for its enforcement and a fund to be expended in detective work.

Aids to navigation.—Owing to the great extent of the coast line of Alaska, with the many islands and indentations, navigation has at all times been difficult and dangerous. Scarcely a year goes by without record of a serious wreck. As fast as money has been made available, new lights and other aids have been installed, each one of which marks some menace to the mariner. Gradually the Lighthouse Service is improving the safety of the coast, but the improvement is being too slowly effected and the money appropriated is not commensurate with the trade demands of the Territory.

Nineteen new lights were established in Alaska by the Lighthouse Service since June 30, 1918. Four lights were changed from fixed to flashing, and 1 gas and bell buoy, 11 buoys of other types, and 3 beacons were established.

The total number of aids to navigation in Alaska, including lights, gas buoys, fog signals, buoys and day-marks, in commission at the

close of the fiscal year ended June 30, 1919, was 459, including 178 lights and 8 gas buoys, representing an increase of 149 lighted aids since June 30, 1910, or over 400 per cent.

The Coast and Geodetic Survey.—The accomplishments of the Coast and Geodetic Survey in making hydrographic and geodetic surveys in the Territory of Alaska during the year for which this report is made, have been materially lessened on account of the fact that considerable of the equipment and many of the officers of that bureau have been assigned to the Navy and the Army to meet the military needs of the Government. The outcome has been that no vessel surveys have been made in Alaskan waters during the year, nor were any geodetic surveys made. The hydrographic surveys were confined to what was accomplished by two wire drag parties.

Mail service.—Great discontent over the mail service in Alaska is manifested on all sides and it is the inadequacy of the service which is hurting Territorial development. Some of the complaints of last year have been satisfied by amended regulations, but mail is still shipped to Alaska as express and freight; the mail clerks are still absent from the steamers, and business requiring action by return mail still languishes. Owing to the fact that freight mail pouches are no longer locked in a mail or express room, it is reported, on reliable authority, that robberies, particularly of parcels, are frequent. West of Seward conditions have been deplorable, owing to the letting of contracts to boats incapable of performing service. For over two months during a severe epidemic of influenza, Kodiak and Afognak Islands were cut off from communication, rendering it impossible to send medical relief.

Alaska fund.—The revenues derived by the Federal Government from business and trade licenses outside of incorporated towns for the fiscal year 1919, amounted to \$280,906.80, as against \$293,161.65 for 1918, a decrease of \$12,254.85. The total revenues received from taxes levied by the Federal Government within incorporated towns, from business and trade licenses, amounted to \$68,229.31, as compared with \$81,101.28 in 1918. The governor recommends that the Alaska fund be covered into the Territorial treasury for expenditure under the direction of the legislature.

Territorial finances.—Taxes collected and other revenues accruing to the Territory are covered into and disbursed from the territorial treasury, the fiscal year of the Territory corresponding to the calendar year. The condition of the territorial treasury for the fiscal year ended December 31, 1918, was as follows: Balance on hand January 1, 1918, \$682,493.11; total receipts from all sources, \$475,450.55; total disbursements under appropriations made by the territorial legislature, \$624,100.85; balance of cash on hand December 31, 1918, \$533,842.81.

At the close of the fiscal year covered by this report there were 15 territorial banks and 3 national banks in the Territory—a loss of 1 during the year. No new banks were established during the year and there were no failures, the loss being occasioned by one of the territorial banks at Nome voluntarily liquidating its affairs.

Deposits in the several territorial banks, at call of April 30, 1919, aggregated \$6,047,543.74, as compared with \$5,974,728.82 under corresponding call of May 8 of the year previous.

Corporations.—On July 1, 1918, there were 258 domestic and 469 foreign corporations transacting business within the Territory, a total of 727. During the fiscal year 1919 there were 17 new corporations formed and 18 foreign corporations registered. There were 33 domestic and 31 foreign corporations dissolved, making a total number of 698 still transacting business, a net loss for the year of 29.

Incorporated towns.—There are at present 17 incorporated towns in Alaska, listed as such with the Secretary of the Territory, but the town organization of Chena has ceased to exist, practically all the inhabitants having moved away and no action has been taken for the last three years to conduct a municipality.

Reports received from 14 of these towns show a total assessed valuation of \$14,195,025. The rates of taxation on the assessed valuation range from 1 to 2 per cent, the average being 1.5 per cent.

Schools.—The public schools of Alaska are administered under both Federal and Territorial laws. The Federal law, known as the Nelson law, provides for schools outside of incorporated towns or incorporated school districts and receives for their maintenance 25 per cent of the Alaska fund. The Territorial laws provide for schools in incorporated towns or districts, one-fourth of the cost of maintenance being borne by the town or district by taxation of real and personal property and three-fourths by the Territory. Territorial laws provide for the establishment of night schools and carry an appropriation for the support of the same. Four communities took advantage of the provisions of the law during the year.

There are 13 schools in incorporated towns and 2 in incorporated school districts, supported in part by territorial appropriation. The averages for the 15 schools, as shown by the table of statistics, are as follows: Average number of teachers, 5.8, with average yearly salary of \$1,279.93 per teacher; average enrollment 130.33; average daily attendance, 100.31; average cost of maintenance, exclusive of teachers' salaries, \$3,970.53. The average cost per pupil was \$87.42, as compared with \$80.14 for the previous year.

For the year 1918-19 schools were maintained in 47 districts outside of incorporated towns and incorporated school districts. The 47 schools employed 60 teachers and had an enrollment of 1,209, as compared with 1,180 the previous year. The average number of

pupils per school was 25.7, as compared with 25.6 the previous year. A total of \$109,650.61 was expended for maintenance, at an average cost of \$2,332.99 per school, as compared with \$2,174.93 for the previous year. The average cost per pupil was \$90.69, as compared with \$84.79.

Territorial legislature.—The fourth legislative assembly convened at Juneau, the capital, on March 3 of this year, and remained in session for the authorized 60 days. Sixty-two laws were enacted. One bill was vetoed by the governor and two failed of approval after the legislature had adjourned.

Labor conditions.—There has been a general shortage of labor throughout Alaska. Mines of all kinds have been working short-handed, resulting in a curtailment of output. The gold mines have been the greatest sufferers, as the operators have not been able to compete for labor as have the copper mines when that metal was in demand.

Wages in all classes of mines compare favorably with wages paid in the States, but with a nation-wide demand, laboring men prefer to work in larger communities, although the opportunities for saving are better in Alaska than almost anywhere else; rents are lower and there are not the temptations to spend.

Selective service.—The operation of the selective-service system in Alaska was carried out with little confusion, under the direction of the governor, assisted by an executive officer, commissioned by the Secretary of War. There were 21 local boards scattered throughout the Territory and four district boards, one for each of the four judicial divisions.

Two thousand two hundred and twenty-three registrants of the class of June, 1917, were inducted and sent to camp, 1,656 of whom were delivered to Alaskan posts. It is estimated that fully 1,500 young men left Alaska and enlisted in the States, either in the Army or Navy and are credited to the States wherein enlistment took place. Many Alaskans are not credited to Alaska in the draft, as a large number of registrants, although they had been in the Territory for years, gave their home address as some place in the States, usually where their parents resided. In consequence, these registrants, when inducted, were credited elsewhere.

Tourist travel.—More tourists have visited Alaska this season than ever before. This is due largely to the closing of trans-Atlantic travel to pleasure seekers and to the well-placed advertising by the bureau of publicity. In fact, travel has been so heavy that returning residents of the Territory have often been obliged to wait for weeks before being able to procure accommodations. The class of tourists has been remarkable. There have been noted publicists, authors.

jurists, musicians, educators, naturalists, and men of world affairs. All have expressed themselves as being astounded at the marvels of scenery, the industries, latent possibilities, and the intelligence and refinement of the population. Some have made investments. All have become ardent supporters of the country.

Public buildings.—The need of a public building at the capital is yearly becoming more apparent. The Federal offices are scattered in various parts of Juneau, in wooden structures, which may at any moment be destroyed by fire. The records of these offices are unprotected, and, if lost, could not be replaced. The office of the governor is housed in a shack, constructed many years ago as an Indian school. The building is unsafe in its present condition, but must continue to be occupied, as suitable quarters can not be procured for the amount appropriated by Congress for rental of office. There is, of course, as in the other offices, the ever-present danger of fire, which, should it break out, will undoubtedly destroy all the valuable archives and books and collection of the historical library and museum. Some of the books are priceless.

Office of the governor.—The office of the governor does not receive the support to which it is entitled. In the face of daily increasing costs the appropriation for salaries of clerks, travel expenses, maintenance of the office and the executive mansion and other contingent expenses for the past two fiscal years has been cut from the prewar allowance of \$7,500 per annum to \$6,000. On December 31, 1918, the entire amount available for contingent expenses had been expended.

The importance of the office is growing every year and the expense must be met from some source. Territorial assistance has been rendered under the excuse that the governor is the executive head of territorial laws. A large part of the maintenance expenses properly belonging to the Federal Government has been borne by the governor personally. Increased salary for the secretary to the governor is asked as well as additional clerical assistance.

Recommendations.—In conclusion, the governor submits a list of the principal recommendations detailed in the body of his report as follows:

Reimbursement of the Territory for money spent for the relief of natives.

Consolidation of all governmental authority possible in the Department of the Interior, thus doing away with conflicting departmental jurisdiction.

Removal of restrictions on export of birch timber from public lands.

Establishment of a uniformed constabulary.

Assignment of naval or Coast Guard ships to continuous duty in Alaskan waters.

Reimbursement of chrome producers for losses incurred while operating under encouragement from the Government.

Restoration of the prewar appropriation of \$100,000 to the Division of Mineral Resources of Alaska, of the United States Geological Survey.

Transfer of jurisdiction over the fisheries to the Territory.

Exemption of Alaskan canneries from the provisional regulations covering the administration of Title XII of the revenue act of 1918, imposing a tax on the employment of child labor.

Assistance to farmers by loan of money and cattle.

Consolidation of authority in local land offices and creation of office of secretary of the Territory.

Restoration of national forests to the public domain.

Appropriation for Mount McKinley National Park.

Increase of contract price for the care of the Alaska insane.

Increased telegraph service.

Increased appropriations for roads and trails.

Increased appropriation to the Bureau of Education for work among the natives.

Appropriations for the reestablishment of musk-oxen in northern Alaska.

Increased appropriations for the protection of game and the suppression of the liquor traffic.

Increased appropriation for the establishment of aids to navigation.

Increased appropriations for coast surveys.

Renewal of mail contract system for the delivery of mail.

Passage of an act covering the revenues now accruing to the Alaska fund, into the territorial treasury.

Amendment of organic act to grant full territorial powers of legislation to Alaska.

Authorization for the construction of a public building at the capital.

Increased support to the office of the governor.

HAWAII.

The report of the governor of Hawaii shows that the financial situation and other conditions have been generally good throughout the Territory during the year ended June 30, 1919. With the rest of the United States the Territory has seriously felt the increased cost of living; a policy, however, of home production of foodstuffs, begun during the war, the lessons of thrift which the war taught, the liberal wages generally paid in various employments and the mild climate of the islands have tended to lessen the hardships resulting therefrom. Sugar and pineapples continued to be the main

crops of the islands. The yield of sugar for the year 1919 is estimated at 600,000 tons, and that of pineapples at 5,000,000 cases.

The future holds promise of a great shipping business for the ports of the islands, in that many of the vessels which will carry freight and passengers on the Pacific Ocean will touch at Honolulu and other harbors. The Territorial government, as well as private business interests are using every effort to make the ports, particularly those of Honolulu and Hilo, attractive in anticipation of this coming traffic.

The governor expresses the opinion that the Territory's borrowing capacity, as prescribed by section 55 of the organic act of the Territory, which now permits the borrowing to a limit of 7 per cent of the assessed valuation of the property in the Territory and in any single year not more than 1 per cent of such assessed valuation, should be increased upon the condition that the extra amount of money provided shall be used only for wharf and harbor improvements. Many of the ships which had formerly called at Honolulu were commandeered for war purposes, causing congestion in passenger traffic and in freight during the past two years. There is a promise, however, that a number of these vessels will shortly be returned to the island trade. On the town side of Honolulu Harbor the Territory is constructing new concrete wharves to accommodate for many years all types of vessels which may call for freight or passengers. To accommodate the trans-Pacific trade, which calls mainly for fuel, water, and supplies, the Territory has acquired title to Sand Island on the west side of the harbor. This island was originally a coral reef covered with water at high tide, but the United States Engineers in their dredging operations pumped material on it raising it to a grade above high-water mark.

On August 21, 1919, Hon. Josephus Daniels, Secretary of the Navy, officially opened the new concrete dry dock at Pearl Harbor, in the island of Oahu. It is 1,001 feet long, 123 feet wide, 35 feet deep, and can accommodate the largest vessel afloat. In addition, there are all the necessary shops for making repairs to vessels, and also a coal dock with storage space for a large quantity of coal.

The business of the Territory is largely agricultural and the bulk of the land most suited to agriculture is in localities deficient in rainfall, making large irrigation projects necessary. Extensive irrigation systems have been developed on the four main islands of the group, and without the water thus supplied most of the larger plantations could not exist. This fact justifies the large expenditures that have heretofore been made in developing the systems that carry water, often through many miles of ditches, tunnels, and pipes from the streams in the rainy sections to the cane fields. Besides the use

of surface streams important developments of artesian wells have taken place, particularly on the island of Oahu. The storage of water in large quantities has not been possible on account of unfavorable topographic features, though there are many small reservoirs. Its water resources are one of the Territory's most valuable assets and should be developed to the fullest extent, so that more land may be brought under cultivation or the land under cultivation may be made more productive.

Comparisons of rainfall and runoff show that only about 30 or 40 per cent of the rainfall reaches the sea by surface streams, evidencing the fact that enormous quantities of water flow from the mountains to the sea in underground channels. The Water Resources Branch of the United States Geological Survey is working in harmony with the division of hydrography of the Territory in the study of surface-water streams as well as in the location and utilization of underground waters.

The organic act of the Territory provides that upon petition of 25 or more qualified citizens the commissioner of public lands shall cause to be surveyed and opened for homesteading any tract of government land desired by the petitioners. Under this law tracts of land are now being opened for homesteading as the general land leases expire. The most recent homestead drawing took place in February of 1919, when approximately 5,500 acres of government cane land at Waiakea, South Hilo, Hawaii, was given out in 183 lots, and 2,242 applicants participated in the drawing for these lots, which is an indication of the eagerness with which homesteads are sought. It is known, however, that a large percentage of the applicants had no desire to become bona fide homesteaders, but took a chance on the securing of a lot for speculative purposes. Furthermore, a much larger percentage of the applicants were not in a position financially to handle a homestead proposition. This was clearly indicated by the fact that of the 183 successful applicants, 50 per cent had to borrow money to make the required payment of 10 per cent on the purchase price at the time of selecting the lots, and a large number did not have the money to purchase a steamer ticket to Hilo.

The Territorial legislature, at its 1919 session, adopted a resolution, which a Territorial commission is to take to Washington in 1920 with a view to having Congress amend the organic act so that land matters can be handled in such a way as to do justice not only to those applying for the land but to the taxpayers of the Territory.

Imports and exports.—The imports for the year ended March 31, 1919, were \$50,743.793, a decrease over the previous year of \$1,057,411. The exports for the year ended March 31, 1919, were \$88,250,021, an increase of \$7,703,415 over a similar period for the previous

year. The following table shows the imports and exports by countries for 1918 and 1919:

Countries.	Imports.		Exports.	
	1918	1919	1918	1919
Australia.....	\$118,443	\$138,289	\$20,284	\$36,141

² Mostly pineapples.

Customs and internal revenue receipts.—Customs receipts for the year were \$858,258.25, as against \$1,009,243.48 for the previous year. The total customs receipts since the organization of the Territorial government in 1900 aggregate \$24,827,883.83. Internal revenue receipts yielded \$5,831,933.19, a decrease over the previous year from this source of \$3,854,907.75.

Territorial finances.—On July 1, 1905, local governments in Hawaii were established for the first time. The Territory was then divided into four counties, one of which, namely, that comprising

the island of Oahu, was converted on January 1, 1909, into a city and county, known as the city and county of Honolulu, with a mayor. The leper settlement on the island of Molokai formed a fifth county, controlled by the Territorial board of health. The Territory continues to collect and pay over to the city and county of Honolulu and the counties of the Territory the greater part of their revenues, and in return receives back from them the cost of assessing and collecting taxes and the interest and sinking fund on bonds issued by the Territory for the benefit of the counties.

The income of the various counties aggregated \$4,692,859.63, as against \$3,872,239.17 for the prior fiscal year. The assessment of property, real and personal, in the Territory during the year aggregated \$250,524,346, as against \$235,650,967 for the prior year.

The total revenues collected by the Territory and the counties amounted to \$7,921,671.90, and the total expenditures aggregated \$8,633,189.11. The current cash balance on hand June 30, 1918, was \$711,517.21, and the current cash balance June 30, 1919, was \$442,609.95.

Bonded indebtedness.—By the provisions of section 55 of the act of April 30, 1900 (31 Stat., 114), as amended by the act of May 27, 1910 (36 Stat., 443), the Territory is permitted to issue bonds not to exceed 7 per cent of the total assessed value of the property of the Territory, but not more than 1 per cent in any one year. The last completed assessment aggregates \$250,524,346, and the borrowing capacity is therefore \$17,536,704.22, the outstanding bonds issued at present amounting to \$9,194,000. The legislature at its 1919 session provided for a bond issue of \$2,231,000. Since June 30, 1919, bonds amounting to \$200,000 have been issued, and the Territorial treasurer is now endeavoring to float additional bonds to the amount of \$1,500,000. The issue of \$200,000 is for the purchase of the Irwin estate property at Wakiiki Beach, Honolulu, as a memorial park for Hawaii's heroes in the recent World War.

The Territorial bonded indebtedness June 30, 1919, is as follows:

Date of issue.	Term of years.	Inter-est.	Sale price.	Percent-age basis.	Aggregate outstanding.	Date due.	Where sold.
		<i>Per cent.</i>					
Oct. 4, 1905	5 to 15	4	\$101.375	3.70	\$270,000	Oct. 4, 1920	Honolulu.
Jan. 2, 1906	5 to 15	3½	98.125	3.66	750,000	Jan. 2, 1921	New York.
Oct. 1, 1907	5 to 15	3½	98.150	3.66	294,000	Oct. 1, 1922	Honolulu.
Oct. 1, 1909	5 to 15	3½	98.250	3.65	200,000	Oct. 1, 1924	Do.
Aug. 1, 1911	20 to 30	4	101.5875	3.88	1,500,000	Aug. 1, 1941	New York.
Sept. 3, 1912	20 to 30	4	100.5887	3.985	1,500,000	Sept. 3, 1942	Do.
Sept. 15, 1914	20 to 30	4	100.01	4.00	1,430,000	Sept. 15, 1944	New York and Honolulu.
May 15, 1916	20 to 30	4	100.00	4.00	1,750,000	May 15, 1946	Do.
Aug. 1, 1917	20 to 30	4	98.04	4.08	1,500,000	Aug. 1, 1947	Do.
Total..					9,194,000		

The total bonded debt on July 1, 1918, was \$8,749,000, which was increased by the sale of \$445,000 of the Aug. 1, 1917, issue of 4 per cent public improvement bonds, 1917, out of a total authorized issue of \$1,500,000.

Bank deposits and insurance.—Twenty-six banks were in operation during the year, distributed as follows: Nine in Honolulu, two at Waialua, and one each at Schofield and Waipahu, on the island of Oahu; three at Hilo, two at North Kona, and one each at Honokaa and North Kohala, on the island of Hawaii; one each at Wailuku, Kahului, Paia, and Lahaina, on the island of Maui; and one each at Lihue and Waimea, on the island of Kauai. Three are national banks, namely, one at Honolulu, one at Schofield, and one on the island of Maui. One of the banks is solely a savings bank, two are solely commercial, and the remainder are both commercial and savings banks.

Bank deposits at the end of the year amounted to \$35,349,134.36, of which amount \$24,898,287.81 were commercial deposits and the remainder, \$10,450,846.55, were savings deposits.

Fire insurance premiums during 1918 amounted to \$932,259.59, and fire losses to \$50,702.58; marine premiums amounted to \$594,739.37, and losses to \$50,833.44. Life insurance written was valued at \$5,271,700.40, the premiums paid thereon amounted to \$268,290.20, and the losses paid aggregated \$526,694.31.

Corporations.—During the year 79 corporations were created and dissolved, as follows, to wit: Created, mercantile 56, dissolved 14; agriculture, created 6, dissolved 4; banking, created 1; savings and loans, created 2; eleemosynary, created 14; leaving at the close of the year 853 domestic corporations, an increase of 61 in all. The total capitalization of domestic corporations other than eleemosynary, etc., is \$175,676,553, an increase of \$4,292,610, or 2.50 per cent for the year. Foreign corporations to the number of 152, as compared with 144 of the preceding year, are authorized to do business in the Territory. The classes, number, and capitalization of the domestic corporations now in existence incorporated before and after the transfer of sovereignty to the United States are as follows:

Hawaiian corporations.

	Number.			Capital.		
	Incorporated before Aug. 12, 1898.	Incorporated since Aug. 12, 1898.	Total.	Incorporated before Aug. 12, 1898.	Incorporated after Aug. 12, 1898.	Total.
Agricultural.....	45	110	155	\$47,866,750	\$36,036,515	\$83,903,265

Forest reserves.....	377,872.65		
Total area of lands of value.....		1,133,116.50	
Lands, no value.....		507,126.69	
Total public lands.....		1,640,243.19	9,346,797.13

Homesteads.—There were taken up during the year 552 homestead lots covering an area of 8,877.364 acres, at valuations aggregating \$563,942.85, or \$63.53 per acre on the average. The homesteads taken averaged 16.082 acres each. They were taken by different nationalities as follows: Hawaiians, 165; Portuguese, 67; Americans, 47; others, 75. To enable homesteaders to obtain homesteads of suitable sizes for their needs they are given the option of taking one or two, or in some cases more lots. There were taken under special homestead agreements 473 lots, under certificates of occupation, 16; under right-of-purchase leases, 39; under cash freehold agreements, 2; homestead leases, 22; and special sales agreements, 37.

During the year 78 homesteads were surrendered or forfeited, covering an area of 1,766.823 acres, valued at \$25,825.21. During the same period 92 transfers of homestead lots were made, having an area of 1,892.69 acres.

A total of 206 planting agreements, representing 3,911.07 acres, were signed. During the year there were sold at auction for cash 28 lots, including residence, church, and business site lots, containing a total area of 69.364 acres, for \$10,691.75. A total of 70 general leases covering 88,319.498 acres were sold at an aggregate annual rental of \$22,992.82.

Patents, leases, and licenses.—There were issued during the year 229 patents, covering an area of 2,946.76 acres, for considerations aggregating \$106,161.87 or at the rate of \$36.02 per acre. Of these 35 were right-of-purchase leases, 10 land exchange, 35 time payments, 7 cash freehold agreements, 47 cash purchases, 44 preference rights, 1 compromise with abutting owner. There were also issued 3 patents based on land-commission awards upon payment of commutation, the

area being 3,328 acres and the commutation \$34. Land and water licenses, seven in number, were issued, bringing a total annual rental of \$2,492.20.

Revenues and disbursements.—The total receipts of the land department were \$545,751.13 as compared with \$575,015.21 for the preceding year. The expenditures of the land department were \$33,905.74 as against \$32,640.01 during the previous year.

Population, immigration, and labor.—The estimated population, including that of the Army and Navy, on June 30, 1919, was 263,666, an increase of 70,757, or 36.68 per cent since the census of 1910. The estimated population of Honolulu, the capital of the Territory, is 78,200. The estimated population of the islands as of June 30, 1919, is as follows: Hawaiian, 22,600; part Hawaiian, 16,660; Portuguese, 25,000; Spanish, 2,400; Porto Rican, 5,400; other Caucasian, 31,000; Chinese, 22,800; Japanese, 110,000; Filipino, 22,000; all others, 5,806.

The number of births during the year was 9,164, as against 9,404 for the previous year. The birth rate per 1,000 population was 34.76, as compared with 36.71 for the previous year. The total number of deaths from all causes was 4,051, as against 4,572 the previous year. The total number of steerage arrivals was 7,435, as against 7,321 for the previous year; the number of departures from the islands was 7,401, as against 8,885 for the prior year, divided as follows: Chinese, 495; Japanese, 5,199; Filipinos, 994; Hindus, 1; Koreans, 33; Porto Ricans, 43; Portuguese, 226; Spanish, 283; Russians, 127; all others, 538.

Public health.—An analysis of the morbidity and mortality statistics shows an increase of 41 in the number of deaths and of 12,577 in the number of contagious diseases as compared with the previous year. The large increase in contagious diseases is due to the epidemic of influenza, which was made a reportable disease by resolution of the board of health on October 21, 1918. In view of the fact that the deaths from influenza number 612 and the total of deaths increased but 41 over the fiscal year ending June 30, 1918, the health of the Territory may be considered to have been good, and the percentage of deaths, especially from influenza, much less than in most communities on the mainland.

The total number of deaths was 4,051, and the annual death rate for 1,000 of population was 15.36. There were 14,616 cases of contagious diseases reported. Tuberculosis, leprosy, and measles increased in numbers while other diseases decreased. No case of bubonic plague was reported during the year; the number of cases of typhoid fever decreased 50 per cent.

Insane asylum.—At the end of the fiscal year, June 30, 1918, there were under treatment in the institution, paroled, and escaped, 251 males and 94 females, a total of 345. There were admitted during

this year 84 males and 33 females, a total of 117. A total of 462 patients, 335 males and 127 females, were treated during the year. A total of 34 patients, 22 males and 12 females, were discharged as recovered, and 5 males and 3 females were discharged as improved during the year. For the same period of time 38 deaths occurred, 30 males and 8 females; there remaining in the institution and on parole as of June 30, 1919, 278 males and 104 females, or a total of 382.

Leprosy.—The number of lepers living at the settlement at Kalau-pau and Kalawao during the year was 669, and of these 425 were males and 244 were females; one was released on parole and 57 died, leaving at the settlement on the 30th day of June, 1919, a total of 611. The nationality of the patients at the settlement was as follows: American, 1; Belgian, 1; Chinese, 24; Filipino, 18; German, 4; Hawaiian, 363; Japanese, 14; Korean, 13; Part-Hawaiian, 123; Portuguese, 44; Porto Rican, 4; Spanish, 1; New Hebrides, 1. At the Kalihi Hospital there were on the 30th day of June, 1918, 38 patients, and 125 were admitted during the year; 60 were transferred to Molokai; 10 were declared not lepers; 19 were paroled and allowed to return to their homes with orders to report regularly to the Government physician in their district; and 6 died, leaving 65 patients in the hospital on the 30th of June, 1919. President Dean, of the College of Hawaii, has given valuable assistance in the preparation of chaulmoogra oil. The results of the last year's work are reported to be especially gratifying. Twenty patients in all were paroled and each one has been examined regularly without recommittal.

Transportation facilities.—Serious congestion in passenger travel and frequent long waits in freight and mail accommodations have continued during the year, owing to a number of large vessels having been in war service in the Atlantic Ocean. Long lists of persons desiring to go to the mainland have crowded the books of the steamship companies for months ahead of sailing dates and hundreds of persons have been unable to secure transportation.

The situation will undoubtedly grow better shortly, and the increase of commerce on the Pacific Ocean will send a larger number of vessels to Hawaiian ports.

Traffic with the mainland.—The Matson Navigation Co. operates the *Manoa*, *Sachem*, and *Lurline* of 6,805 tons, 3,130 tons, and 5,928 tons, respectively, between San Francisco and Honolulu, and the *Enterprise*, 2,675 tons, between San Francisco and Hilo.

Three big steamers of this company, the *Maui*, *Matsonia*, and *Wilhelmina* of 10,261 tons, 9,728 tons, and 6,974 tons, respectively, were operated by the United States Government in the war zone and are still retained for Government purposes. The *Lurline* and

Manoa made three voyages to Manila during the year, calling at Honolulu both ways.

In the freight trade the *Hyades*, 3,753 tons, and the *Annie Johnson*, power schooner, 1,049 tons, were recently returned to island traffic after having been requisitioned by the Federal Shipping Board between October, 1918, and April, 1919. Sundry freight vessels of American and Danish registry are consigned to this company, and all have taken cargoes of sugar or canned pineapples on their return voyages to San Francisco or Atlantic ports. The company has recently instituted a Seattle-Honolulu-San Francisco-triangular freight service with four steamers which were built for the United States Shipping Board. It is anticipated that when this line is fully established there will be a sailing every 10 days from Seattle.

The American Hawaiian Steamship Co., which has been in the island trade since January, 1901, has operated during the year 1919 a number of Shipping Board vessels allotted to it in place of its regular vessels, all of which had been requisitioned by the Government for war work and placed in service on the Atlantic Ocean. This substitute fleet has transported approximately 185,000 tons of sugar during 1919 from Hawaiian Island ports to Atlantic ports via the Panama Canal. As the Government will probably soon release the regular fleet, it is anticipated that the regular service between New York and the Hawaiian Islands via the canal will be resumed during the early part of 1920.

Through traffic.—The China Mail Steamship Co. operated the steamers *China* and *Nanking* between San Francisco and oriental ports, carrying first, second, and third class passengers to and from Honolulu. Early in May, 1919, the *Nanking* was requisitioned by the Federal Government for war purposes, and it is not the intention of the owners to have this vessel call at Honolulu when returned to private operation.

The Pacific Mail Steamship Co. has continued to operate the *Ecuador*, *Venezuela*, and *Colombia*, vessels of 14,000 tons each, between San Francisco and oriental ports with stop-overs at Honolulu both ways. In addition, the company has a Manila-East India service with two 16,000-ton passenger and freight steamers, the *Santa Cruz* and *Colusa*, which also stop regularly at Honolulu on the homeward voyage.

The Toyo Kisen Kaisha is again operating its full fleet of steamers, consisting of the *Shinyo Maru* and *Tenyo Maru*, of 22,000 tons each, the *Siberia Maru* and *Korea Maru*, of 20,000 tons each, the *Nippon Maru*, of 14,000 tons, and the *Persia Maru*, of 9,000 tons. These vessels are on the run between China, Japan, and Honolulu, and San Francisco, while the *Anyo Maru*, of 18,500 tons, the *Kiyo Maru*, of

17,200 tons, and the *Seiyo Maru*, of 14,000 tons, are on a run including China, Japan, Honolulu, San Francisco, Mexico, Panama, and South America. These three vessels call at Hilo after leaving Honolulu on the outward trip from Japan. The *Persia Maru* and *Seiyo Maru* were recently returned to the company by the United States Government after seeing considerable service in the Atlantic war zone. With the return of the *Seiyo Maru* to the South American service the *Nippon Maru* was again placed on her regular run between San Francisco and the Orient.

The Oceanic Steamship Co. is operating the two passenger steamers *Sonoma* and *Ventura*, 6,200 tons each, and the freight steamer *Jacox*, 3,500 tons, on the run between San Francisco and Sydney, by way of Honolulu and Pago Pago. The *Sonoma* and *Ventura* touch at each point every four or five weeks. The *Jacox* makes the round trip every three months.

The Canadian-Australasian Royal Mail Line has the *Niagara* and *Makura*, 13,500 and 8,075 tons, on the Sydney-Vancouver run. Steamers sail from Honolulu north about every 28 days. It is stated that the *Makura* will eventually be removed and another steamer, probably a trifle larger than the *Niagara*, put in her place. The trip from Sydney to Vancouver and return requires 36 days, including a stop of five days at Vancouver.

The Standard Oil Co. operates a fleet of five steamers between the mainland and the Territory. These vessels delivered during the calendar year 1918 a total of 495,080 barrels of fuel and refined oils and 26,433 cases and 989 barrels of lubricating and refined oils.

The Associated Oil Co. operates four vessels and during the fiscal year these delivered 477,802.27 barrels of fuel oil.

The Union Oil Co. of California, which operates four steamers, received during the fiscal year 53,332.94 barrels of fuel oil.

A number of sailing vessels continue to bring general merchandise and coal from foreign ports.

Interisland traffic.—Most of the interisland traffic is conducted by the Inter Island Steam Navigation Co. (Ltd.), which operates a fleet of 12 steamers, varying in length from 136.1 feet to 252 feet and from 11.5 to 18 feet draft; from 341 to 1,566 gross tons and from 201 to 940 net tons. The total tonnage is 8,987 gross and 5,834 net.

During the fiscal year this company carried 81,803 passengers and 400,030 tons of freight, which is a decrease of 8,395 passengers and a decrease of 2,115 tons of freight as compared with the previous period.

The Oahu Shipping Co. operates a fleet of six motor vessels with a gross tonnage of 569 tons, two seagoing barges, and an oil vessel. During 1918 this company carried 66,670 tons of freight between island ports. No passengers are carried.

Street railroads.—The Honolulu Rapid Transit & Land Co. controls and operates the only street railway system in this Territory. It is an electric line, partly single and partly double track.

During the year the company expended for betterment of the system \$95,411.47. Outstanding capital stock is \$2,000,000. Gross income for the calendar year of 1918 was \$735,151.14, an increase of \$8,547.74 over that of the preceding year. Disbursements were \$814,736.71, an increase of \$14,744.93. The number of fare passengers was 14,304,489, a decrease of 73,603 from the previous year. The number of free passengers carried, principally policemen, letter carriers, firemen, and employees, was 177,219, a decrease of 14,083. School children are carried at half rate. The car mileage was 2,069,359.61.

Telegraphs and telephones.—In addition to the cable system across the Pacific Ocean which has been in operation a number of years,

there are three wireless plants, which are either wholly or in part operated by the Government. The Government has also operated the interisland wireless system of the Mutual Telephone Co. of Honolulu since the beginning of the war.

The sending station of the Marconi Wireless Co., which was taken over by the Government upon the day war was declared, was turned back on March 20, 1918, but is being held in readiness to be placed in operation upon short notice. The Marconi sending station at Koko Head was taken over by the Government on January 8, 1918. On August 1, 1919, the Government ceased to operate this station, but is still holding it. It is expected that with the ratification of the peace treaty the company will be put in full charge of both stations, which will then be operated on a duplex system.

The Mutual Telephone Co. operates the principal telephone system on the island of Oahu, and now has in operation 775 instruments, with 43 miles of conduit, 115 miles of cable, and 1,300 miles of open wire in Honolulu alone. Outside of the city it has 1,164 miles of copper wire, 1,675 miles of iron wire, and 777 instruments.

On the island of Hawaii the Hawaii Telephone Co. of Hilo operates 1,521 instruments, with 2,600 miles of open wire. The Kohala Telephone Co. on the same island operates 103 telephones, on 225 miles of wire, and will add 150 miles of wire and several telephones next September.

The Mutual Telephone Co. of Wailuku, Maui, operates 1,059 instruments with 1,812 miles of wire, and the Kauai Telephonic Co. of Lihue, Kauai, has 280 telephones and 495 miles of wire in operation.

Education.—During the year there were maintained 168 public schools, with 1,063 teachers and 36,102 pupils, an increase of 5.1 per cent over the previous year. The cost of general maintenance of schools during 1919 was \$1,206,924.32, and the cost of new buildings was \$167,910.49. The number of private schools was 61, having 370 teachers and a total attendance, male and female, of 7,169. The number of pupils of all races in public and private schools was 43,271, as against 41,644 for the year 1918.

At the beginning of the year nearly all of the men students at the College of Hawaii were enrolled in the Student Army Training Corps. After demobilization in December there were many readjustments; the military experience obtained by the students had much of an educational value. A course in sugar technology has been placed on a better basis by an arrangement under which students are enabled to work at the experiment station of the Hawaiian Sugar Planters' Association and at the factory at Kahuka. The total regis-

tration for the year was 145, of whom 68 were studying for degrees; by classes there were, graduates, 1; seniors, 5; juniors, 6; sophomores, 16; freshmen, 14. The geographical distribution of the students is as follows: Oahu, 118; Hawaii, 12; Kauai, 4; Maui, 6; Japan, 2; China, 1; California, 1; and Michigan, 1.

There are two industrial schools in the Territory, one for boys, situated at Waialeale on the northern shore of the island of Oahu, and one for girls at Moiliili, a suburb of Honolulu. These institutions receive and care for all the juvenile delinquents who are not paroled and put on probation by the juvenile court in Honolulu or the circuit judges of the outside islands, who also act as juvenile judges. The instruction is chiefly of a vocational nature, and the children receive a portion of their earnings. There were 143 boys in the boys' school at the end of the fiscal year, having ages ranging from 8 to 20 years, and in the girls' school there were 114 girls. As a war measure the girls worked in a local pineapple cannery during the summer and with a part of the money thus earned bought a thousand-dollar Liberty bond.

In the Hawaiian Library the registration at the end of the year was 8,957, an increase of 760 over the previous year. The home use of books aggregated 115,518, greater by 7,641 than any previous period. Of those holding library cards, 54.2 were adults and 45.8 children. The number of visitors to the reading and reference rooms totaled 51,800, and the number of books in the library 41,860. Library instruction has been given to all grammar-school grades above the fourth, and the children taught the use of catalogues and ordinary reference books. There has been a notable gain in attendance of the children at the library. The islands department has increased its stations from 163 to 224, of which 57 are community libraries, 79 school libraries, and 88 home libraries. The library holds an important place as a social center, there being 291 meetings of various kinds held there during the year.

The indexing of the correspondence of the archives of Hawaii, which was discontinued in May of 1918, has been resumed and will be continued during the coming year. The indexing of important matters in the bound volumes of newspapers on file has been finished up to 1904. This index, which begins with 1836, has proven of great value, and information on a variety of subjects official and historical has been supplied.

There was compiled, by the librarian, a "Roster of the Legislature of Hawaii" from 1841 to and including the session of 1919. This book of 300 pages contains not only a list of members of the different sessions, but also the several constitutions of the Kingdom of Hawaii, and that of the Republic, the speeches of the monarchs from Kame-

hameha III to Liliuokalani, and of the President to the legislature, and an alphabetical list of members during the period mentioned, giving individual records. A historical sketch of the evolution of the legislature since the creation of a law-making body, by proclamation of the King in 1829, forms the preface. The work was published in February, 1919, as publication No. 1, of the archives of Hawaii, and given wide distribution both in Hawaii and on the mainland. It has met with a very favorable reception and has been highly commented on by a number of State and law librarians.

Work on the revision of the Hawaiian Dictionary was continued. Act 18, session laws of 1913, put this work under the direction of the archives commission. Act 123, session laws of 1919, provides that all future work shall be done by a commission of three persons, to be appointed by the governor upon the recommendation of the commissioners of public archives, said commissioners to continue the supervision of the work.

Legislature.—The principal business enacted by the legislature at the session of 1919 was financial. Of the 242 acts approved, 94 involved money from the general fund. In addition the legislature enacted a loan bill providing for public improvements to the amount of \$4,901,698, more than half of which is for wharf and harbor improvements. Concurrent resolutions were also adopted recommending that the governor set aside lands for nine public parks. Certain members of the 1919 legislature, by going back on their pledge to support woman suffrage, earned the ill will of a large majority of the people, and as a result the legislature received little credit for any good legislation. Following is a list of some of the measures enacted:

Act 15. To provide for a quarantine station in the city of Hilo.

Act 22. Permitting the practice of chiropractic.

Act 50. Providing for the issuance of \$200,000 of bonds to build a breakwater at Nawiliwili, Kauai, the Federal Government to appropriate at least an equivalent amount.

Act 62. Amending the municipal act.

Act 63. Modifying the power of eminent domain as exercised by counties.

Act 73. Providing for training of nurses at the Queen's Hospital and issuing certificates to them.

Act 83. Giving further protection to forest reserves.

Act 97. Providing for an appropriation for the celebration of the centennial of the death of Kamehameha I.

Act 102. Making an appropriation to provide for the feeble-minded.

Act 107. Providing an increase in the pay of school-teachers.

Act 109. Relating to the storage of explosives.

Act 118. Making an appropriation to build a wharf at Kapaa, Kauai.

Act 121. Providing for a fish and game commission, to establish a fish hatchery and appropriating \$25,000 for the use of the commission.

Act 129. To provide for the support of children of indigent, widowed, or abandoned mothers, and creating local boards to administer such support.

Act 131. For the establishment of a school for blind and other defective children.

Act 138. Providing for the acquisition of property at Nawillwill, Kauai, for wharf and warehouse purposes.

Act 158. Amending the sinking fund act.

Act 186. Defining the crime of criminal syndicalism and providing punishment therefor.

Act 187. Making an appropriation to provide for calling a Pan-Pacific Congress in Honolulu, 1920-21.

Act 190. Providing for the purchase of the Irwin Beach property at Waikiki, to be made a part of Kapiolani Park.

Act. 203. Changing the College of Hawaii to a university.

Act 207. Consolidating all the laws providing for the issuance of public loans.

Act 212. Establishing a biological laboratory at the Kapiolani Park Aquarium and placing the College of Hawaii in charge.

Act 225. Farm loan act, with an appropriation of \$100,000 for advances to homesteaders.

Act 227. Providing for the identification of automobiles belonging to the Territorial or county governments, so as to be used for official business only.

Act 229. Providing for the purchase of Washington Place, the former residence of Queen Liliuokalani, as an executive mansion.

Act 233. Regulating investment companies so as to provide against fraud in the sale of securities.

The legislature adopted a concurrent resolution providing for the appointment by the governor of a commission to have charge of the celebration in 1920, of the landing here of the first missionaries, March 31, 1820.

Following is a list of some of the more important resolutions passed:

House concurrent resolution 2. Requesting Congress to amend the Federal farm-loan act so as to include the Territory of Hawaii in its provisions.

House concurrent resolution 3. Requesting Congress to amend the organic act so as to allow the homesteading of larger areas of pastoral lands.

House concurrent resolution 4. Requesting Congress to appropriate funds for roads and water systems in homestead tracts and to assist homesteaders and farmers in the Territory of Hawaii.

House concurrent resolution 16. Requesting Congress to enact a law so as to allow half the customs and internal-revenue receipts collected in the Territory of Hawaii for 20 years from date of July 1, 1918, to be placed in a separate fund and expended only for public works in the Territory of Hawaii.

House concurrent resolution 28. Requesting Congress to amend the organic act in regard to homesteading.

House concurrent resolution 30. Asking that suspension of the coastwise shipping law, as applied to passenger traffic, remain in force until more American steamers are plying between Hawaii and the mainland of the United States.

Senate concurrent resolution 5. Requesting the right of statehood for the Territory of Hawaii.

Senate concurrent resolution 7. Requesting Congress to extend the benefits of the reclamation act to Hawaii.

Senate concurrent resolution 8. Favoring the enactment of a law whereby persons appointed to Federal positions in the Territory of Hawaii shall have resided for not less than one year in such Territory.

Senate concurrent resolution 11. Requesting an amendment to an act of Congress approved March 28, 1916, so as to authorize the Territorial board of harbor commissioners to make toll or tonnage charges on freight passing over wharves, etc.

Senate concurrent resolution 17. Requesting that the abandoned Federal Leprosarium at Kalawao, Molokai, be turned over to the Territorial board of health for the care and treatment of lepers.

Senate concurrent resolution 20. Directing the attorney general of the Territory of Hawaii to compile a list of, and a report upon, the cost incident to the acquisition by condemnation of all private fishing rights within the Territory of Hawaii.

Senate concurrent resolution 31. Providing for the appointment by the governor of a commission to investigate and report on the feasibility of establishing a free port or zone in the Territory of Hawaii.

Senate concurrent resolution 36. Authorizing and requesting the governor to appoint a commission to be known as the "Legislative Commission of the Territory," for the purpose of assisting the Delegate to Congress by their presence in Washington in the presentation of measures to Congress.

GENERAL EDUCATION BOARD.

This corporation, which was created by the act of Congress approved January 12, 1903, section 6 of which requires the corporation to annually file with the Secretary of the Interior a report, in writing, stating in detail the property, real and personal, held by the corporation, and the expenditure or other use or disposition of the same or the income thereof during the preceding year, has for its object the promotion of education within the United States. The corporation owns no real estate, its property consisting of securities and money divided into various funds, according to the purpose for which it is to be used.

On June 30, 1919, the principal funds belonging without restriction to the board amounted to \$34,176,110.01, invested in stocks and bonds.

The income from the above funds, together with the income from undisbursed income, amounted during the year to \$2,982,210.08. The balance of income from previous year as of June 30, 1918, amounting to \$8,074,037.92, together with a gift from Mr. John D. Rockefeller from his special fund, amounting to \$349,746.91, increased the total amount available for disbursement to \$11,405,994.91.

Disbursements from income during the year were as follows:

Universities and colleges for whites, for endowment.....	\$564, 910. 96
Colleges and schools for whites, for current expenses.....	12, 500. 00
Professors of secondary education.....	35, 634. 70
Rural school agents, white.....	60, 257. 55
Lincoln School.....	115, 000. 00
Colleges and schools for negroes.....	170, 535. 00

Meharry Medical School (Negro).....	\$7,500. 00
Rural school agents for negroes.....	47,988. 77
Summer schools for negroes.....	9,570. 00
County training schools for negroes.....	18,711. 28
Home-makers' clubs for negroes.....	35,481. 08
Expenses of special students at summer schools.....	12,727. 14
Negro rural school fund.....	20,000. 00
John F. Slater fund.....	3,000. 00
Association of colleges for negro youths.....	500. 00
Maine agricultural demonstration work.....	24,284. 47
New Hampshire demonstration work.....	16,000. 00
Educational investigation and research.....	18,053. 69
General survey of educational conditions and needs in North Carolina..	2,081. 31
General survey of educational conditions and needs in Virginia.....	8,046. 35
Survey of mental measurements of school children.....	3,575. 87
Expenses rural school agents at Harvard summer school.....	7,662. 37
Model county organization.....	9,950. 00
Conferences.....	4,485. 66
University of Chicago (interest).....	27,157. 51
Yale University (interest).....	21,858. 75
Lafayette College (interest).....	515. 44
Administration expense.....	136,359. 32
	1,394,347. 22

This leaves an undisbursed balance of income on June 30, 1919, of \$10,011,647.69. It is invested as follows: Bonds and stocks, \$9,204,-190.60; cash, \$774,479.85; accounts receivable, \$32,977.24.

It should be noted, however, that against this balance there are unpaid appropriations amounting to \$9,381,338.72.

The John D. Rockefeller special fund, mentioned in previous reports, is now completely used. The special fund derived its income from that portion of the funds set aside for the University of Chicago which remains undelivered, together with income from undisbursed income. On August 22, 1919, Mr. John D. Rockefeller surrendered his control over this fund, giving to the board the balance carried forward June 30, 1918, of \$264,955.31 and income received and to be received, which amounted during the year to \$84,791.60.

The Anna T. Jeanes fund, the income to be used for Negro rural schools, amounts to \$200,000. It is invested as follows: Bonds, \$164,355; stocks, \$35,645.

The income from this fund during the year was \$10,141.95. Added to the balance from the previous year, the total available income amounted to \$16,780.26. Of this, \$10,353.01 was appropriated and paid to various schools, and \$28.83 paid out for expenses, leaving a balance of \$6,398.42 in cash.

¹ This item is 5.786 acres greater than was given in report for the preceding fiscal year. The discrepancy is the result of an error in computing the acreage of a withdrawal in Montana made and reported during the last fiscal year. The withdrawn area in Montana outstanding June 30, 1918, should have been reported as here given.

Metalliferous classification.

REPORT OF THE SECRETARY OF AGRICULTURE.

WASHINGTON, D. C., *November 15, 1919.*

SIR: America during the war helped to save Europe and to preserve civilization by making available to the Allies, through increased production and conservation, large supplies of foodstuffs. But for this contribution, it is difficult to see how the Allies could have waged the war to a victorious conclusion. Lacking such support and with their own producing capacity seriously crippled, the German people experienced partial famine conditions; their health and vitality were greatly impaired; and the collapse of their military power was due in no small measure to the shortage of food.

The cessation of hostilities brought no immediate improvement in Europe. On the contrary, in some respects more adverse conditions developed. Revolution became the order of the day; the directing hand of government was removed; discipline was relaxed; the morale, particularly of the people of the Central Powers, was broken; idleness and unemployment prevailed; and in some sections anarchy reigned. It was obvious that Europe could not produce sufficient foods for herself. Her crops had been short for several years and it was scarcely probable that those for 1919 would be greater than the crops of the last year of the war. Quite as unsatisfactory was the live-stock situation. In nine of the western nations the number of cattle had declined more than 7,000,000, sheep 7,500,000, swine 24,500,000, and dairy cows several millions, with a greater proportionate reduction in the volume of products.

Food relief after the armistice was imperative not only for the peoples of the new small friendly nations but also of the enemy countries. It became the key to the whole situation and to the establishment of a real peace. Europe had to be fed if order was to be restored and if European civilization, and, therefore, that of all the world, including our own, was to be preserved. America had again to assist in saving Europe and herself by supplying food, and that in great abundance. It was estimated that Europe would need to import at least 20,000,000 tons of bread grains alone, and that of this quantity 11,000,000 must come from the United States. It was obvious also that she would call for large imports of meats and fats, and that for months, until shipping expanded again, most

of these must be obtained from the United States. This burden America was able to assume because of the achievements of her farmers. The full story can not be told; only the outcome can be suggested.

1919 ACREAGES AND YIELDS. •

The farmers of the Nation, in 1919, planted an acreage in leading cereals greater by 33,000,000 than the prewar annual average (1910-1914), which, it is estimated, will yield 635,000,000 bushels more than the prewar average, and increased the number of milch cows over 1914 by 2,700,000, of other cattle by 8,500,000, of swine by 16,700,000, and of horses and mules by 1,000,000, or a total of 28,900,000. The planting operations for the year began before the fighting ceased. The call was still for more wheat. The Department suggested a maximum fall acreage of 47,206,000 acres, an increase of 12 per cent over 1918. There was actually planted 49,261,000, the largest acreage in the Nation's history, 6,960,000 acres more than in 1918 and 15,608,000 more than the five-year average, 1910-1914. The spring-wheat acreage was 22,593,000, while the winter and spring plantings combined amounted to 71,854,000 acres, or 7,200,000 more than the preceding record and 19,400,000 more than the prewar average. It is estimated that the yield will exceed that of 1918 by 1,000,000 bushels and will be the Nation's second record wheat crop. The estimated corn crop of 2,910,000,000 bushels will be 300,000,000 greater than that of 1918 and only slightly less than the high yields of 1915 and 1917.

If the fighting had continued and the season had been favorable, there is little question that the farmers of the country would have planted an aggregate crop acreage, during the winter and spring, greater than that for any preceding year in the Nation's history.

Forecasts of meat production for 1919, from partial reports of slaughtering, indicate that the record figure of last year—20,250,000,000 pounds—will be exceeded. The total will probably reach 21,000,000,000 pounds, as follows: Pork, 12,900,000,000 pounds, compared with 11,248,000,000 in 1918 and 8,769,000,000 in 1914; beef, 7,500,000,000 as against 8,500,000,000 in 1918 and 6,079,000,000 in 1914; and mutton, 600,000,000 pounds as against 537,000,000 in 1918 and 739,000,000 in 1914.

A rough estimate, based upon the number of milch cows and the census average of milk production per cow, indicates that the number of gallons of milk produced in 1919 will aggregate 8,495,000,000, or 57,000,000 more than in 1918 and 1,029,000,000 more than the average for 1910-1914. The figures for poultry and egg production have not been accurately ascertained, but it is roughly estimated, upon the basis of reported increases from one census to an-

other, that egg production in 1919 will aggregate 1,957,000,000 dozen, as against 1,921,000,000 in 1918 and 1,774,000,000 in 1914, and that the number of poultry raised on farms will approximate 600,000,000.

EXPORTS.

The exports of foodstuffs, enormous during the war, rose greatly between the armistice and midsummer. The annual average exports of important cereals for the five years preceding the war were 162,000,000 bushels. They rose to 517,000,000 in 1915 and aggregated 448,000,000 in 1919. Dairy products, of which 25,000,000 pounds were exported on the average during the five-year period before the war, increased in volume to 102,400,000 pounds in 1915, 217,500,000 in 1916, 352,000,000 in 1917, 592,000,000 in 1918, and 781,000,000 in 1919; while the exports of meat and meat products were 1,291,000,000 pounds for the five-year average before the war, 1,500,000,000 in 1915, 1,800,000,000 in 1916, 2,300,000,000 in 1918, and 3,300,000,000 in 1919.

The following tables may facilitate the examination of these essential facts:

Acreage of crops in the United States.

VALUES.

On the basis of prices that have recently prevailed, the total value of all crops produced in 1919 is \$15,873,000,000, compared with \$14,222,000,000 for 1918; \$13,479,000,000 for 1917; \$9,054,000,000 for 1916; \$6,112,000,000 for 1914; and \$5,827,000,000 for the five-year average, 1910-1914. These values represent gross production and not net returns to the producer. The value of live stock on farms in 1919 was \$8,830,000,000, compared with \$8,284,000,000 in 1918; \$6,736,000,000 in 1917; \$6,021,000,000 in 1916; \$5,890,000,000 in 1914; and \$5,318,000,000 for the five-year average, 1910-1914.

This increased financial showing, it is again necessary to emphasize, does not mean that the Nation is better off to that extent or that its real wealth has advanced in that proportion. Considering merely the domestic relations, the true state is indicated rather in terms of real commodities, comparative statements of which are given in the foregoing tables. The increased values, however, do reveal that the monetary returns to the farmers have increased proportionately with those of other groups of producers in the Nation and that their purchasing power has kept pace in the rising scale of prices.

PROGRESS OF AMERICAN AGRICULTURE.

The results of agricultural operations during the war furnish guaranty of the ability of the present farm population of the country, with the area now in farms and in the existing state of agricultural science and practice, to meet the Nation's necessities for the near future if the requisite incentives are furnished. But there are reasons for further optimism. As has been repeatedly pointed out, we still have a large area of untouched tillable land. This is somewhat generally understood, but it is not so well known that, as the result of improved processes and better practices in all sections, there has been an upward tendency in the acre yields. As a mat-

ter of fact, the view seems more frequently to be expressed that in this respect American agriculture has deteriorated. The facts disprove this, and in no part of the Union more strikingly than in the older regions, such as the New England and North Atlantic States.

Crop yields per acre in the United States show an upward tendency during the period for which we have reliable comparable statistics. The average rate of increase for the past 25 years has been about one-half of one per cent a year. This gain is not readily observed from one year to another, owing to the wide yearly fluctuations in yield. But when averages for a series of years are obtained, the effect of the seasonal variations is largely neutralized and the general trend is clear. The upward tendency is shown graphically in the following charts:

During the decades of the seventies and eighties, when there was a vast expansion of farm area in the West and crops were grown on a more and more extensive scale, the tendency of crop yields per acre was downward. Since the early nineties, however, the movement has been upward.

In the decade of the eighties, that is, for the 10 years ending with 1890, the average yield per acre of wheat in the United States was 11.84 bushels; for the past 10 years, that is, for the 10 years ending in 1918, it was 14.87—an increase of 25 per cent.

For the 10 years ending in 1890 the average yield of corn in the United States was 23.43 bushels; in the 10 years ending in 1918 it was 25.81—an increase of 10 per cent.

The oats yield in the 10 years ending in 1890 averaged 25.92 bushels, but in the 10 years ending in 1918 it was 32.17—a gain of 24 per cent.

The potato crop averaged 72.97 bushels per acre for the 10 years ending in 1890, and 96.84 for the last 10 years—an increase of nearly one-third.

By a like comparison, it may be observed that the hay yield rose from 1.193 tons per acre to 1.432—an increase of 20 per cent.

Cotton, notwithstanding the ravages of the boll weevil, increased from an average of 169.78 pounds in the decade ending in 1890 to 175.73 in the last decade—a gain of $3\frac{1}{2}$ per cent.

Other field crops have likewise shown greater yields. The average increase per acre of all crops in the 10 years ending in 1918, compared with the 10 years ending in 1890, was about 16 per cent.

The tendency toward enlarged output per acre is general throughout the United States; it is not due to a shifting of production from one section to another. For example, in the old agricultural State of New York the increases for the two periods mentioned above were as follows: Corn 24 per cent, wheat 44, oats 21, barley 24, buckwheat 43, potatoes 30, hay 10, average of all (weighted) 18 per cent. The facts for the New England States may appeal to many as even more striking and significant. For the six New England States, the following gains are shown in the 10-year period, 1909–1918, over the average for 1866–1875: Corn 33 per cent, wheat 63, oats 25, barley 27, rye 27, buckwheat 17, potatoes 27, hay 24, and all field crops 25 per cent; and for the 10 years, 1909–1918, over the average for 1881–1890: Corn 38 per cent, wheat 60, oats 24, barley 29, rye 44, buckwheat 45, potatoes 69, hay 23, and all field crops 26 per cent. For convenience of comparison, the accompanying table is inserted:

Comparison of crop yields in six New England States.

Crops.	Percentage increase in average yields per acre during 10 years, 1909-1918, over—	
	10-year average, 1866-1875.	10-year average, 1881-1890.

Barley.....	27	29
Rye.....	27	44
Buckwheat.....	17	45
Potatoes.....	27	69
Hay.....	24	23
All field crops (weighted).	25	26

The gains noted are real; that is, they are not due to changes in statistical method. They are observed in the official statistics of most foreign countries, as well as in those of the United States.

The increased production per acre shown is due, in considerable measure, to the practice of better agricultural methods, including the use of more efficient farm machinery; better knowledge and fuller adoption of crop rotations; planting of crops better adapted to prevailing climatic conditions; development and adoption of varieties more resistant to plant diseases and insect pests; more general application of disease and insect control measures; increased and more intelligent use of fertilizers; and improved efficiency in crop production generally.

FOREIGN YIELDS ALSO INCREASED.

Not only in the United States, but in most civilized countries of the world, the yield per acre has been tending upward in recent years. This is noted in respect to wheat in practically all wheat-growing countries. If we compare the average wheat yields per acre in the 10-year period, 1891-1900, with those in 1901-1910, we find that in the United Kingdom there has been an improvement of 6 per cent, that is, from 30.1 to 31.9 bushels; in the Netherlands, of 19 per cent, or from 27.7 to 33; in New Zealand, of 28 per cent, or from 24.6 to 31.5; in Sweden, of 14 per cent, or from 24.2 to 27.6; in Germany, of 23 per cent, or from 23.6 to 29.1; in Ontario, of 12 per cent, or from 19.4 to 21.8; in Manitoba, of 7 per cent, or from 17 to 18.2; in France of 8 per cent, or from 18.1 to 19.5; in Hungary, of 3 per cent, or from 17.3 to 17.8; in Japan, of over 2 per cent, or from 17 to 17.4;

in Poland, of 3 per cent, or from 15.5 to 15.9; in Roumania, of 21 per cent, or from 14 to 16.9; in the United States, of 8 per cent, or from 12.9 to 13.9; in India, of 16 per cent, or from 9.7 to 11.3; in Caucasia, of 18 per cent, or from 9.5 to 11.2; in Russia, excluding Poland and Caucasia, of 14 per cent, or from 8.3 to 9.5 bushels. These countries are given in the order of their relative rank in yield per acre during the period 1891-1900. Satisfactory comparative data are not available for Argentina. Similar gains have been observed in other crops.

The average yields in the United States are frequently compared with the much larger yields in some European nations. In Belgium the average yield is about double that in the United States; in the United Kingdom, more than 60 per cent greater, and in France, nearly 15 per cent. It should be borne in mind, however, that the energy of each American farmer is spread over a larger area and that, although he produces less per acre, he produces much more per man. The total output of the average farmer is probably greater in the United States than in any other country in the world. Thus, in Belgium, with its intensive system of farming, only about 5.3 acres are cultivated for each person engaged in agriculture, whereas, in the United States, the corresponding figure is 27 acres. Taking both acreage and yield per acre into consideration, the average American farmer produces 2.5 times as much as the average Belgian farmer; 2.3 times as much as the English; 3.2 times as much as the French; 2.5 times as much as the German; and over 6 times as much as the Italian.

For many years to come the average yield per acre in the United States may be expected to increase, although the total output per man may diminish. This country has a long distance to go before it comes in sight of its limit of farm production. It can further increase its output of commodities by continuing to secure increased yields per acre. It has been estimated by experts that only about 15 per cent of the land in cultivation is yielding reasonably full returns. The opportunity is presented, as conditions warrant, to bring the remaining 85 per cent up to the point of fair yield. One of the objectives of all good farmers and of the agricultural agencies assisting them is to promote increased yields along economic lines by the further application of scientific knowledge and the adoption of improved practices. The path of progress is pretty well charted and the agricultural forces are moving along it with gratifying speed. However, the maintenance of satisfactory increases necessitates the continuance and enlargement of investigational work, particularly such as is required to insure fuller control of destructive plant diseases and insect pests.

FARM LAND PROBLEMS.

The Nation can further expand its output of commodities by cultivating the tillable land which at present is unused, estimated to be over 60 per cent of the total. But there has been no such full consideration of the policy which should be pursued in reference to the extension of the farm area as has been given to economical production. Since the Nation now retains but little land of ready availability, agricultural expansion will result mainly from efforts to utilize and to increase the productivity of farm lands now owned by individuals, corporations, and the States.

A number of important questions must be answered: How rapidly should new areas be developed? What means should be employed to bring new lands into use, so that settlers may achieve success, employ sound methods of husbandry, and establish a wholesome community life? What is the significance of the increase of tenancy and what may be done to establish a system of land tenure which will insure good farming and a sound and democratic foundation for American agriculture? What is the bearing of the increasing prices of land and the resulting speculation on the progress of agriculture and the welfare of the farmer?

EXPANSION OF AREA IN FARMS.

The expansion of the Nation's agriculture is limited by the supply of labor and capital available for farming purposes rather than by the scarcity of undeveloped lands. It is true that, in general, the best land is already in cultivation, but without question much of the remainder can be tilled when the country reaches the economic stage which would justify its utilization.

There are numerous fallacious opinions with respect to the need of extending the farm area. Many people, noting the prevailing prices of agricultural products, demand increased production and insist that the remedy lies in immediate and rapid expansion of the acreage in farms. Others, observing large tracts of unused land, deplore the great waste of our resources. Still others explain the movement of population from rural districts to cities by the non-availability of land, which they attribute to land monopoly, speculation, and other evils. The demand for farm products, unlike the demand for manufactured articles, does not expand rapidly to meet a large increase in supply. There is a tendency toward an equilibrium between urban and agricultural industry. If too much labor and capital are diverted from farming, the relative prices, and consequently the relative profits, of agricultural activity will increase, and there will be a tendency toward expansion. If this is excessive, however, relative prices and profits will tend to decrease and the

industry may suffer depression. The inelasticity of demand for farm products sets a very decided limit at a given time to the increase of population and capital profitably employed in agriculture.

It is not in the interest of producers or consumers to have large fluctuations in agricultural production. There is always danger of glutting the market and of serious loss. The aim rather should be to secure a steady flow of commodities of sufficient volume to supply an increasing demand at prices which will yield the farmer a decent wage and a fair profit on his investment. It seems difficult to get it into the minds of some people that farming is a business and must pay; that under modern conditions there can not be an unlimited number of farmers. There could be a larger proportion of farmers to total population if each farm were self-sufficient and produced no surplus of consequence, but to-day the average farmer produces many times what he consumes of some things and is dependent for his prosperity upon their profitable exchange for other articles which he uses. There should be, and in the long run there will tend to be, no more farmers in the Nation than are needed to produce the quantity of products which can be disposed of at a profit. There will be farmers enough if the business of farming is made profitable and if rural life is made attractive and healthful. The consumers must be willing to pay prices for farm products which will enable farmers to produce them and to maintain a satisfactory standard of individual and community life. The Nation also must be prepared to omit nothing to improve the countryside. It is of the first importance that satisfactory schools, with courses of study related to the problems of rural life, be provided, that good roads be constructed, and that adequate provision be made to give rural communities the requisite sanitary and medical services, including hospital facilities. When these requirements are met, we shall not have to concern ourselves as to the number of farmers and the adequacy of our agricultural production. There will then be no difficulty in retaining in the rural districts a sufficient number of contented and efficient people. What we need is not a "back to the land" propaganda, but an acceleration of the movement for the improvement of the countryside which will render the abandonment of farms unnecessary and the expansion of farming inevitable.

There is reason to believe that a considerable expansion in farmland area occurred during the war. The acreage devoted to the 19 principal crops increased 10.1 per cent from 1914 to 1918. Accordingly, the crop area per capita increased from 3.22 acres in 1914 to 3.33 in 1918, or 3.4 per cent. This expansion probably resulted in part from the use for crops of land normally devoted to other purposes, especially to pasture. However, it seems to indicate that the farming industry has more than held its own during the period.

This conclusion is confirmed by an increase not only in the per capita production of nearly all the important crops, but also, according to a recent report, in the number of cattle and swine per capita. Moreover, estimates for milk, eggs, and poultry indicate an increase in per capita production during the war. In view of these facts, it probably would be unwise to stimulate a large increase in the per capita farm acreage at the present time, especially where such an increase would have to be effected by utilizing land which is inferior or which would be made available at a heavy outlay for drainage, irrigation, or clearing. Apparently, therefore, American agriculture should consolidate the gains already made; prepare for the period of competition which is to be expected with the return of normal world conditions, principally by increasing, through sound and economical methods, the productivity of areas already under cultivation; and utilize the services of the most experienced and judicious agricultural leaders in determining where, when, and how to bring into cultivation and develop public and private unused land.

The best experts of the Federal department and of the agricultural colleges should make a careful investigation of the possibilities of utilizing land not now devoted to agriculture. In respect to the 200,000,000 acres of cut-over land, the 60,000,000 requiring drainage, and the 30,000,000 which may be irrigated, there is great variation from district to district as to the possibility of economic use. Distinctive regions should be fully studied with a view to assemble all existing data on productivity, cost of making the land available, present tenure and prices, type of agriculture best adapted to the conditions, possible returns, minimum size of farms capable of supporting families in reasonable comfort, minimum equipment needed at the beginning of settlement, sources of credit, and marketing and transportation facilities.

LAND SETTLEMENT.

At present various private agencies are engaged in promoting land settlement. Many of them are honest in intention, promise, and practice; others keep within the letter of the law but, through exaggeration and indirection of statement, create false impressions in the mind of the settler. Many violate no canon of fair business practice, but their interest is in profits and they do not pursue a policy calculated to develop a profitable and wholesome community life. Only a few have made careful studies of the conditions of successful settlement and developed their business with a view to the settlers' progress and success. Practically all are seeking to realize the highest possible price for their undeveloped holdings, and the settler is compelled to face the problem of adjustment to pioneer conditions while carrying a burden of land value

which often represents, in part, the capitalization of a future increase in earning power.

The intending settler of small means is rarely able to distinguish between the good and bad methods of selling land in new regions. The more unscrupulous the land company the more lurid are its advertisements and the more extravagant its promises. Settlers often are induced to invest all their savings in land not suitable for successful farming, to purchase more land in relation to the capital available for development than they should, or to undertake projects the cost of clearing or reclamation of which will prove to be prohibitive. The results, in many instances, have been tragic failures after years of incredible hardships, waste of capital and of human lives, discouragement of intending settlers, and injury to the business of legitimate and well-meaning land concerns.

It would be desirable if governmental agencies, by systematic aid, should furnish reliable information to those seeking farms, should take particular pains, through their agricultural machinery, to give new settlers very special assistance and guidance, and, where conditions are favorable, should aid in the development of well-considered settlement plans.

TENANCY.

The increase of tenancy has become the subject of deep concern to thoughtful students of rural conditions. The tenant, on an average, remains on the same farm only about one-sixth as long as the owning farmer. Consequently, he often manifests little interest in the improvement of the farm and in the progress of the community. A certain proportion of tenants is normal and may not be unwholesome. Many farm owners, because of age or infirmity, find it necessary to retire. Their farms are temporarily operated by their sons or other relatives who subsequently may become owners through inheritance or purchase. Large numbers of young men with little capital find tenancy a convenient stage in their progress to ownership. Certain local studies reveal the fact that nearly two-thirds of the farm owners who operate their farms have passed through this stage. Frequently it serves as a useful period of apprenticeship in farm management before the heavier financial burdens of ownership are assumed.

In a great many cases the farmer has not yet acquired sufficient experience as a manager to operate his farm efficiently without the assistance of the landlord. In some instances, also, the tenant has been reared in an environment characterized by lack of thrift, self-restraint, and systematic industry. He may not have the general intelligence or technical knowledge to stand alone in the management of a farm. Where these personal limitations exist the solution of the problem lies in education, training, and the development of

systematic habits of industry and thrift rather than in radical changes in the system of tenure.

Since there will continue to be a certain number of tenants, every effort should be made to change the conditions of leasing so as to improve the methods of agriculture, increase the period of occupancy, and insure a fair division of returns; and the States should provide by law for a system of compensation by owners to tenants for unexhausted improvements and set up the necessary administrative machinery. Such arrangements have prevailed in England for many years to the benefit of all concerned.

Although landlords may, and often do, play an important part in financing and in operating farms, there are large numbers who live at a distance and who contribute nothing toward their efficient utilization or improvement. Moreover, they often fail to interest themselves in promoting the progress of the community in which their land is situated, although they benefit by such progress. Land, however, is peculiarly important to all the people and the welfare and prosperity of the community, as well as its economic and social progress, depend so vitally on its use and the relationship of the population to it that serious thought must be given to the problem of limiting absentee ownership.

The endeavor to develop a more harmonious and efficient relation between tenant and landlord and to restrict absentee landlordism does not obviate the necessity of taking measures to retard the increase of tenancy. The road to farm ownership should be made as smooth as possible. This may be accomplished in part by providing more liberal credit facilities. The Federal Farm-Loan System has furnished a means whereby farmers may conveniently borrow under the conservative conditions of first-mortgage security. However, an analysis of the amount loaned shows that only a small proportion of the net proceeds was ostensibly obtained for the purchase of farms.

In some sections the growth of tenancy has been stimulated by the fact that the price of land has been higher than the level justified by current earnings. Consequently, it has been more profitable to rent than to buy unless one wished to speculate in land values. Recently there has been a tendency for prices to increase with extreme rapidity. There has been active, and in many respects unwholesome, speculation which has profited mainly the real estate agents. A heavy charge, therefore, has been placed against the earnings of the land on the assumption of the continuance of war prices. The advancing price of land is especially serious in the case of the undeveloped regions of the country. It constitutes an obstacle to development, for the actual settler is compelled to assume at the outset unduly heavy interest charges.

EXTENSION OF FORESTRY.

The continued dissipation of privately owned forests in every timber-producing region of the country is a matter of grave concern. The public does not fully realize its seriousness. If the area having little or no value for other than forest purposes is not protected, much of it will become practically nonproductive. Millions of acres in the older parts of the country where supplies of timber are needed by the communities have become almost valueless. Where the land is not valuable for agriculture large-scale lumbering operations are followed by local industrial depression, the timber industries migrate, population decreases, farmers lose their local market, taxable values decline, schools and roads deteriorate, and the economic and social life of the community suffer.

The problem presented is very difficult. Public forests are confined to relatively limited areas, except in the West. These will by no means supply the future needs of the country. At present the greater part of the lumber produced annually is cut from private lands on which the appearance of new growth is at best a matter of accident, is likely to be long delayed, or may never occur. Without concerted action under public cooperation and direction the problem will not be solved. Private initiative can not be depended upon to secure the requisite conservation.

The preservation of forests in all forest regions is of immediate concern and importance to farmers. Timber is an important farm crop. Farm woodlands comprise about 20 per cent of the farm area of the country. At the last census the value of the products from them was greater than that of the potato crop and nearly double that of the tobacco yield. Forestry, therefore, must be assigned a place in farm management. Farmers also are vitally concerned with national forestry problems. They consume more wood than any other group and they are interested in seeing that there is available, at reasonable prices, a continuous supply of lumber and other forest products. A sound forestry policy does not conflict with agricultural settlement. In fact, it facilitates the cultivation of land suitable for agriculture, and also seeks to secure the proper handling of existing forests and the reforestation of denuded regions. On the other hand, forest devastation retards agricultural development.

NECESSARY STEPS.

Certain things seem clear. Fire is a great menace not only on forested but also on cut-over areas. Adequate protection, therefore, should be required of all owners. The public, through both the State and Federal Governments, should cooperate in organizing this service and should share the cost of maintaining it. It should also adopt such practical measures as may be necessary to bring about the dis-

continuance of all practices which result in turning the forests into wastes, and should aid private owners to perpetuate their forests by proper management. A well-balanced policy requires a much larger program of publicly-owned forests than at present. The acquisition of forest lands by the Federal Government is now proceeding under the Weeks forestry law. The total area approved for purchase to date is 1,835,298 acres. The continuation of the policy is sought by the National Forest Reservation Commission, and an estimate of an appropriation of \$10,000,000 will be placed before the Congress. And, furthermore, the consolidation of National Forest areas through exchange with private owners should be accelerated. There are now pending no less than 25 bills authorizing exchanges, and the enactment of a general law would be in the public interest. There is a growing demand for additions to the National Forests from the public lands in the States where such action is possible only through legislation. Recently a law authorizing the addition of 1,000,000 acres to the National Forests in central Idaho has been enacted.

Good forestry practice rests upon the possession of full and accurate data. Our present knowledge of the methods of securing the largest yields is inadequate. There is need of further information regarding the amount, quality, and distribution of existing timber supplies. A detailed inventory of our present resources and a survey of present and prospective needs are essential for constructive planning.

FARM MANAGEMENT AND FARM ECONOMICS.

Until comparatively recently studies in farm economics were neglected. In the last 10 or 15 years it has come to be recognized that the prosperity of the farmer depends as much upon good business methods as upon his practices in plant culture and animal husbandry. In 1906 the Department of Agriculture inaugurated investigations in farm management, which remained in the Bureau of Plant Industry until 1915, when the Office of Farm Management was established as a branch of the Office of the Secretary. During the latter part of the calendar year 1918 steps were taken to reorganize the work. At my request, a committee composed of recognized authorities on farm management and agricultural economics made a thorough study of the activities of the office, not only with a view to enlarge the scope and increase the efficiency of the work but also to outline definite methods of procedure to be followed in the study of farm-management problems, and especially the cost of producing agricultural products. The members of this committee were: G. F. Warren, professor of agricultural economics and farm management, State College of Agriculture, Ithaca, N. Y.; Andrew Boss, chief of the division of agronomy and farm management, State College of Agriculture, St. Paul, Minn.; H. C. Taylor, head of the department

of agricultural economics, College of Agriculture of the University of Wisconsin, Madison, Wis.; J. A. Foord, professor of farm management, State College of Agriculture, Amherst, Mass.; J. I. Falconer, professor of rural economics, State College of Agriculture, Columbus, Ohio; R. L. Adams, professor of agronomy, State College of Agriculture, Berkeley, Calif.; and G. I. Christie, Assistant Secretary of Agriculture and Director of Extension in Indiana.

This committee submitted a report to me, which I approved and which has been published as Circular No. 132 of the Office of the Secretary. It not only outlined the field of work of the Office of Farm Management but also recommended that its name be changed to Bureau of Farm Management and Farm Economics, and that the investigations conducted by it be carried on in close cooperation with the agricultural colleges and experiment stations in order to prevent duplication of effort, to promote the development of farm management activities in the various States, and to unify the methods and improve the general character of all farm management work. On the basis of these recommendations, separate conferences were held for the purpose of indicating in greater detail the activities proposed by the reorganization committee, and especially to consider the projects relating to cost of production, farm organization, land utilization, and farm life.

These conferences resulted in the following approved projects:

(1) **COST OF PRODUCTION STUDIES.**—The value and importance of such studies are set forth clearly in the report of the reorganization committee, as follows:

Cost of production studies are of value to the individual farmer and, at the same time, are helpful in ascertaining the economic status of farming as an industry.

From the standpoint of the individual farmer the primary purposes are:

- (1) To record the details of the farm business for reference.
- (2) To give an insight into the elements and interrelations of the different farm activities.
- (3) To furnish information that may enable the farmer to reduce costs or otherwise increase profits.
- (4) To make possible a comparison of the profitableness of the different enterprises and combinations of enterprises.

The records secured by cost of production studies give data for analyzing the farm business, and thus are of fundamental importance in the whole program of agricultural research and education. The results of such studies on a number of farms where a given type of farming is practiced are useful not only to the farmers from whose farms the results were obtained, but are of value in showing other farmers how to improve their methods.

From the standpoint of the public, cost of production studies provide the facts which give a basis for intelligent judgment upon the probable effects of any given legislation or other public activity upon the farmer as a producer and as a citizen. Cost of production studies are therefore one of the means of providing the basic facts needed by legislators and price commissions in comparing the profits of competing lines of production and estimating necessary price.

(2) **FARM-LIFE STUDIES.**—These studies are to be conducted with a view to make living conditions in the home and in the community more satisfactory to the farm family. They will cover the following topics: Rural home life; opportunities for social contacts in typical rural communities; the relation of educational and religious institutions to farm-life problems; problems relating to geographical population groups, such as the relation of urban and rural populations, the shifting of rural populations, race elements in rural districts; social aspects of tenancy and landlordism; rural organizations, their efficiency, scope, causes of success and failure; social aspects of various types of farm labor—the married and unmarried farm hand, seasonal and child labor; the relation of various forms of disability—the aged, illiterate, defective, dependent, delinquent—to farm-life problems; and the social consequences of local disasters due to natural causes, as well as of thrift and agencies for promoting it.

(3) **LAND ECONOMICS (LAND UTILIZATION)**, involving the consideration of land resources, values, ownership and tenancy, settlement and colonization, and land policies.

(4) **FARM ORGANIZATION.**

(5) **FARM FINANCIAL RELATIONS.**

(6) **FARM LABOR STUDIES.**

(7) **AGRICULTURAL HISTORY AND GEOGRAPHY; and**

(8) **DEMONSTRATION ACTIVITIES.**

The supervision of the task of executing the new program was assigned to Dr. H. C. Taylor, who was appointed Chief of the Office of Farm Management. Dr. Taylor, before accepting this position, owned and operated a farm in Wisconsin and also was head of the department of agricultural economics in the college of agriculture, University of Wisconsin. The department also secured the services of Mr. Francis W. Peck, of the University of Minnesota, who has had wide experience in studies of the cost of producing farm products, to take charge of the enlarged activities in this important field; of Dr. L. C. Gray, of Peabody College, to direct the work relating to land economics; and of Prof. C. J. Galpin, of the college of agriculture of the University of Wisconsin, to supervise the farm-life studies. This is merely a part of the plan to secure some of the best available minds in the country to direct the work relating to farm management and farm economics.

APPROPRIATIONS REQUIRED.

Arrangements promptly were made to develop the activities of the Office of Farm Management along the lines suggested by the reorganization committee. As it was clear that existing funds were inadequate, I submitted to the Congress, on May 23, 1919, a revised estimate calling for appropriations, during the fiscal year 1920, aggregating

\$611,990, compared with \$305,090 during the fiscal year 1919, an increase of \$306,900. Aside from statutory salaries, it was proposed to allot the appropriation to the following lines of work, in the amounts indicated:

Cost of production studies.....	\$245, 000
Farm organization.....	53, 600
Farm finance and farm relations.....	21, 560
Agricultural history and geography.....	29, 200
Land economics (land utilization).....	112, 920
Farm-life studies.....	20, 560
Demonstration activities (extension work).....	32, 820

It was hoped that the necessary additional funds would be included in the agricultural appropriation bill for 1920, which was then pending. Unfortunately, however, Congress did not take favorable action on the proposal. It not only did not grant the increases recommended but inserted a proviso in the bill which restricts the amount that may be expended on cost of production studies during the present fiscal year to \$23,873.

Although the funds at the disposal of the office were small, every effort has been made to carry out the reorganization program along the lines indicated. I am renewing, in the estimates of the department for the fiscal year 1921, the recommendation that approximately \$611,900 be provided, and that the name of the present Office of Farm Economics.

Having secured the best experts available to direct the principal Farm Management be changed to Bureau of Farm Management and activities of the office, I am confident that the work now under way and proposed, if the necessary funds are appropriated, will be executed in a highly satisfactory way, and that facts and information of immense value to individual farmers in dealing with their own problems, and also to the Nation for its guidance in considering broad agricultural policies, will be obtained and made available.

CROP AND LIVE-STOCK REPORTING SERVICE.

Accurate and complete statistics are prerequisite to the satisfactory consideration of any problem. They are of overwhelming importance to the millions of people interested in rural life, and especially those charged with the responsibility of aiding, by legislative and administrative processes, the successful development of our great agricultural industry. Suggestions as to the direction of production and plans to improve marketing and distribution wait upon them, and in any national crisis they are essential to the intelligent handling of the Nation's food problems. In this direction, as in many others, the war has brought home in very direct fashion the need of improvement.

The value of dependable information on acreage, crop yield, number of live stock, and farm surpluses can not be overestimated. The Bureau of Crop Estimates has slowly developed an organization to secure and verify many valuable data. It is now necessary to extend it. The time has arrived for placing the work in all the States on a county basis. It is important that the live-stock and feed-reporting service be enlarged, that farm surpluses be ascertained, and that information regarding foreign crop and live-stock production be more fully secured and reported. It is peculiarly urgent that this be done at the present time. The 1920 census is about to be taken. It will furnish new base lines, and the department should be in a position, by reason of an improved service, to supply the country each year after the census with as full and accurate data as possible.

Estimates to make it practicable for the department to execute the enlarged program will be laid before the Congress for consideration at its regular session. If they are approved, the field force of the bureau will be strengthened by placing an assistant field agent and a clerk in each State. Additional specialists also will be appointed to collect, interpret, and present information regarding special crops and classes of live stock. The bureau then will be in a position to report for the Nation as a whole, for each State, and for each county, monthly or oftener if necessary, acreages to be planted; surpluses or deficiencies of seed, fertilizer, labor, and farm machinery; acreages actually planted; progress of farm work; acreages abandoned and harvested; damage from weather conditions, insects, and plant diseases; condition of crops and forecasts of production; yields per acre and production at or near harvest; acreages and yields of principal varieties of each crop; disposition and utilization of the crops produced; marketable surpluses and stocks on farms; prices received by farmers as distinguished from market quotations; prices farmers pay for supplies, machinery, and equipment; hours and wages of farm labor; and the foreign situation. These reports will cover about 70 crops, including such special items as vegetables, nuts, fruits, seed, oils, forest products, and nursery stock, for all which adequate reports have not been available, except in the census years.

Likewise, there will be given the number of horses, mules, dairy cattle, beef cattle, swine, sheep, goats, and poultry, by age and sex classifications corresponding with the census enumeration of January, 1920; of pure bred animals of each kind; of those bred, born, or brought on to the farm; of those sold, slaughtered, or lost through disease, exposure, or other causes; of those remaining on hand and on feed; the condition of the various classes of animals; farm prices; and the feed situation, including the carrying capacity of pastures

and ranges, the number of silos, the quantity of silage and other forage available, as well as the domestic meat, dairy, poultry, wool, and hide production, and the foreign situation.

Available foreign crop and live stock estimates will be secured and published, especially for countries of deficient supply and those of surplus production in competition with the United States, and periodical world balance sheets will be prepared, showing for the principal countries of the world the production requirements, imports, exports, and net deficiencies or surpluses of the major crops and classes of live stock.

It is proposed to establish intimate cooperative relations with State departments of agriculture and State assessors. In this way greater accuracy will be secured and the aggregate expense to the States and the Nation reduced. As the value of reports depends not only on their completeness and accuracy but also on their quick availability, they will be issued very promptly and more frequently, summaries will be released on dates of issuance, and the Crop Reporter will be changed from a monthly to a weekly basis.

VALUE OF COMPLETE ESTIMATES.

It need scarcely be pointed out that county estimates are of great importance to the work of the county agents and the extension service in each State, to manufacturers and business men who supply farmers with equipment and machinery, to banks which furnish funds for financing crop production and movements, and to transportation companies for supplying cars when and where needed to move crops. They have already been made in a number of States. Preliminary estimates of acreages intended to be planted will enable farmers to determine whether their plans should be modified. Estimates of surpluses or deficiencies in the supplies of seed, fertilizers, and farm help tend to equalize both distribution and prices and to insure adequate farm production. Estimates of acreage, yield per acre, and production of each principal variety of a given crop, in addition to total production of the entire crop, will show the relative adaptability and productivity of varieties, and therefore will be of assistance not only to farmers, but also to seedsmen and to crop specialists and plant breeders of the State experiment stations and of the Federal Department of Agriculture. Those of crop damage by counties from insect pests and plant diseases will enable the entomologists and plant pathologists to work more intelligently in developing and applying remedies. Those of marketable surpluses on farms, or the portion of the crop sold from the farm and entering the channels of trade, will facilitate the satisfactory marketing and distribution of surplus production. Such estimates have been

made for apples, peaches, potatoes, and truck crops, and they were promptly and effectively utilized by growers and marketing agencies.

Perhaps the most important feature of the enlarged program is that relating to live stock, which represents not only a farm investment of more than \$10,000,000,000 but also constitutes the meat supply of the Nation, a considerable portion of the export trade, a very important factor of successful farm management and economy, and 50 per cent of all farm sales. Yet for this important industry the bureau, with its inadequate facilities, has been able to estimate, once a year, only the gross number of animals on farms, the number of brood sows, and the total losses from disease and exposure. No attempt has been made in the past to estimate dairy and poultry production between censuses, the annual value of which amounts to approximately \$3,000,000,000. The great losses occurring yearly from drought and feed shortage in portions of the Great Plains and in limited areas of other sections might, to a considerable extent, be reduced by having definite and detailed information regarding the feed situation.

The expenditure of money for the execution of this program will clearly be an investment, which should be made without delay in order that agricultural and business interests may have the benefit of the improved service during the period of readjustment. It should be borne in mind also that the proposals are in no sense experimental. Their feasibility and practical value have been fully demonstrated.

MARKETING AND DISTRIBUTION.

In the field of distribution, as well as in the field of production, the farmers of the Nation must assume the main tasks of improvement. The Government should furnish all possible aid in the way of information and suggestion, create favorable conditions under which production and distribution may take place, and especially see that the channels of trade are open and that abuses do not exist.

The present time is especially fruitful of proposals of a large and novel nature designed quickly to solve marketing problems. Recently measures have been introduced into the Congress proposing a private or a governmental agency of national range, with State and county subdivisions, to supervise, or even to direct, the handling or marketing of the Nation's farm products. The probability is that an undertaking of such character would break down of its own weight. There is no question that everything which can legitimately be done to eliminate waste in marketing and to promote orderly distribution should be done. But the views of the most experienced students of the matter seem to be that we must approach the problem in simpler

terms, work along lines which have clearly proven to be feasible, and promote existing tendencies and practices.

Certainly, we can proceed further, by State, Federal, and individual action, in standardizing the production, the handling, and the packing of farm products, and in promoting the use of standard containers and proper storage on farms, in transit, and at market centers. We can continue to furnish assistance in the preparation and installation of accounting systems, and more extensively and accurately gather and furnish to the farmers of the Nation all pertinent statistical information. I need scarcely emphasize the paramount importance of making available daily to producers facts as to market prices, supplies, and demands. The market news services of the Department of Agriculture have already clearly proved their value. The department now conducts and operates an inspection service on fruits and vegetables covering 164 markets. It publishes reports on the supply, commercial movement, and prices of most of the important products and, in cooperation with 14 States, is issuing exchange marketing lists which make known to county agents, breeders, and feeders in these States, where surpluses of live stock, feeds, and seeds are to be found. It is estimated that last year, through such service, the farmers in Iowa alone made local exchanges having an estimated value of \$1,500,000.

COOPERATIVE ASSOCIATIONS.

Particularly must the Federal and State agencies omit nothing to promote farmers' cooperative associations along right lines. Already, within a generation, many such bodies have appeared and rapidly expanded. It is estimated that they now market annually approximately \$1,500,000,000 worth of commodities. They are of very diverse forms and sizes. For the most part, where they have been successful they have centered their activities on some one product, or on related products, in a given area. The indications are that, with the continued success of these enterprises and with the proper educational effort and direction, they will develop even more rapidly in the future. Through bulletins, news articles, and lectures, the Department of Agriculture has endeavored to stimulate these efforts. It has furnished suggestions for State legislation governing their organization and, in cooperation with 23 States, it has employed trained specialists to advise extension workers, including county agents, and others, with reference to cooperative marketing.

As I have said, the rational program would seem to be to expand these activities, which have clearly demonstrated their value, to follow the scent as it were, and further to develop the machinery through which increased assistance may be furnished. There should be in every State one or more trained market specialists of the De-

partment of Agriculture, working in cooperation with the proper State authority, to stimulate cooperative enterprises and to aid farmers in their marketing work by helpful suggestions as to plans and methods. These experts could very effectively aid the extension workers. County agents generally have the assistance of specialists in many other lines, but at present they have not the requisite aid in distribution. They can not be expected to be expert in all agricultural matters or to be omniscient. The department is requesting increased funds to make this extension possible and will take the necessary action promptly if the appropriations are made.

GOOD ROADS.

Good roads are essential to the prosperity and well-being of urban and rural communities alike. They are prerequisite for the orderly and systematic marketing of farm products, for the establishment of satisfactory rural schools, and for the development of a richer and more attractive rural life. Recognizing these facts, the Federal Government, through the passage of the Federal aid road act in 1916, inaugurated a policy of direct financial participation in road-building operations in the various States. This act appropriated \$75,000,000, to be matched by an equal amount from the States, for the construction of rural post roads over a period of five years, and \$10,000,000—\$1,000,000 a year for 10 years—for roads within or partly within the National Forests. It required each State to have a responsible central highway department with the requisite powers and funds. All the States have complied with the terms of the act, although it was necessary for them to enact additional legislation, or to amend their constitutions; to provide sufficient funds to match the Federal apportionment; and to strengthen existing central highway bodies or to create new agencies.

When these preliminary steps had been practically completed and the department and the States were about ready to proceed vigorously with the actual construction of roads, the United States entered the war. It soon became necessary greatly to curtail highway building because of the difficulty of securing transportation, construction materials, and the requisite services. After the armistice was signed, arrangements promptly were made for the active resumption and vigorous prosecution of road work in all sections of the country, not only with a view to repair the damage wrought by the heavy traffic forced upon our highways during the war, when maintenance operations were seriously interfered with, but also to provide adequate transportation facilities to serve the increased needs of agriculture and industry. Recognizing also that road-building activities would furnish suitable employment for many unemployed men during the period of transition from war to peace, the

Congress at its last session, accepting the recommendation of the Department of Agriculture, appropriated \$209,000,000, in addition to the \$85,000,000 provided by the original act, for the extension of road construction in cooperation with the States, and also made some important amendments to the act. The definition of the kind of roads that can be constructed was greatly broadened and the limitation on the Federal contribution for any one road was increased from \$10,000 to \$20,000 a mile. These amendments have greatly facilitated consideration of and action upon the road projects submitted by the State highway commissions. There is now no special obstacle to the construction, in the different States of the Union, of the roads which serve the greatest economic needs.

TRoublesome Limitations Removed.

The act, as amended, places only three limitations on the type of road which may be built, as follows:

(1) That the roads shall be "substantial in character." This means that the road must be so constructed that it will carry the prospective traffic with such maintenance expenses that the total annual charges will represent a reasonable expenditure for the public service rendered by the highway. It is to the interest of the States that the roads on which Federal funds are used be substantially constructed, because the law requires them, or their civil subdivisions, as a prerequisite to receiving further funds, to maintain properly all roads built with Federal aid. There is nothing in the law which restricts types of construction between narrower limits than those established by sound finance and good engineering practice.

(2) That the amount contributed from the Federal Treasury in connection with any road shall not exceed 50 per cent of its cost or \$20,000 a mile. The main thing is to build a road that will stand the traffic in the particular section of the country where it is constructed. The conditions in certain regions may require a heavy, comparatively high-cost type of road, while in others a lower cost type may meet all the requirements. Sentiment is growing throughout the country, even in the newer sections, in favor of more substantial roads. The people are beginning to realize that the expense of maintaining the lighter traffic types under heavy traffic is unbearable.

(3) That the road must be a "rural post road" as defined in the act as amended; that is, "any public road a major portion of which is now used, or can be used, or forms a connecting link not to exceed 10 miles in length of any road or roads now or hereafter used for the transportation of the United States mails." Under the original wording of the law, Federal funds could be expended only on roads upon which the United States mails "now are or may here-

after be transported." This feature was the most troublesome to the highway departments of the various States. It required a definite determination in each case of the actual post-route status of the road, which necessarily involved delays in many instances. Under the new definition, very few important roads, if any, will be debarred from receiving Federal aid, if all the other requirements of the act are met.

Following the amendments to the act, the regulations governing its administration and the standards for plans, specifications, and estimates were modified, and one of the most successful former State highway engineers in the country was placed in charge of the Federal aid road work. He has at his disposal a large staff of local and district engineer aids, and no pains will be spared to provide any further Federal assistance that may be needed. An advisory committee, composed of representatives of the State highway departments, selected at the request of the department, by the American Association of State Highway Officials, with due regard to geographic considerations, also has been appointed to work in intimate touch with the Federal bureau, meeting with its officers at stated periods and at such other times as may seem desirable.

LARGE RESULTS FROM PRESENT FEDERAL LAW.

The record indicates that from July 1, 1918, to November 1, 1919, the department approved 1,345 road projects, involving the improvement of 12,159 miles, at an estimated cost of approximately \$181,143,644. Of this sum, approximately \$78,592,167 represents Federal funds. Since the passage of the Federal aid road act, 1,927 projects have been approved. These call for the construction of 18,596 miles of road at an estimated cost of \$225,267,847, of which about \$95,498,140 will be borne by the Federal Government. Gratifying progress also has been made in connection with the National Forest road work. From July 1, 1918, to November 1, 1919, 74 projects, involving 923 miles of road, were approved, and plans were completed for the improvement of 50 others, aggregating 946 miles.

The 1919 program for Federal aid road building is greater than any previous annual road-building accomplishment in this country. It is so great, in fact, that it undoubtedly will be necessary for many of the States to postpone until 1920 the expenditure of the Federal funds because of the necessity of developing experienced contracting and engineering organizations from the stagnant conditions brought about by the war. Under the terms of the act, the apportionment to a State for any one fiscal year remains available for expenditure until the close of the succeeding year. It is estimated that the funds already provided will be sufficient to finance next year a program more than four times greater than any that has ever been under-

taken. As indicated, \$294,000,000 has been made available from the Federal Treasury, and it is roughly estimated that the State funds to be expended cooperatively on road projects under the terms of the Federal act will aggregate \$385,000,000.

It is also true that some States will expend large sums in excess of those to be used on cooperative projects and that their several subdivisions will provide large additional amounts. It is interesting to note that up to July 1, 1919, State bond issues aggregating \$224,800,000 had been authorized and approved by popular vote and that provision has been made for voting next year on proposals for the issuance of additional State road bonds to the extent of approximately \$314,000,000. During the present and the next fiscal year, there will be made available for road improvements at least \$1,000,000,000. Certainly, few laws, if any, have produced greater results, either in terms of expenditures for a good purpose or in terms of helpful legislation and machinery, than the Federal aid road act. It seems clear, in the circumstances, that the principal limiting factors in the 1920 program will be those of rail transportation for, and production of, suitable road materials, the contractors' organizations available, and the labor supply.

NO ADDITIONAL ADMINISTRATIVE MACHINERY NEEDED.

The suggestion has been made that the Federal supervision of highways should be taken from the Department of Agriculture and placed under a Federal highway commission. A bill having this purpose in view has been introduced in the Senate of the United States. It provides for a Federal highway commission of three, each receiving a salary of \$10,000 a year, whose duty, among other things, would be to establish, improve, repair, and maintain a system of highways "to comprise not less than 2 per cent nor more than 5 per cent of the total highway mileage actually used as such in any State as ascertained by the commission hereinafter provided for, nor less than 2 per cent nor more than 4 per cent of the total highway mileage actually used as such in all of the States as ascertained by the commission, and affording convenient ingress to and egress from each State at not maintain buildings outside the District of Columbia, to operate less than three points and connecting with highways forming part of the national highway system in adjoining States." The commission is given the power to select or establish the highways to be comprised in the system, after having requested the State highway departments to recommend routes, and to determine the order in which all or parts of such highways shall be constructed, reconstructed, improved, repaired, and maintained. The Federal Government is to assume the maintenance of these roads. The commission

is furthermore empowered to take over the work of the Department of Agriculture relating to highway transportation, to construct and housing and subsistence facilities and commissary stores for the benefit of its employees and others engaged on work under its direction, and to purchase, lease, operate, and maintain such motor and other transportation facilities as it may deem necessary in the performance of its duties.

In considering any proposal of this sort, certain fundamental considerations must be borne in mind: (1) The roads in each section of the country are of varying degrees of importance in the service which they render or may render to the particular locality, to the State, and to the Nation as a whole; (2) this is a big country and the traffic conditions and needs vary greatly from section to section; (3) the State highway departments, being in immediate touch with local conditions, are best able to classify the roads properly on the basis of the economic purpose which they may serve; (4) the Federal Government, under the Federal aid road act, is cooperating in the improvement of the roads of greatest importance, the classification of which is fixed by the State highway departments; and (5) when this classification has been carefully made and by agreement between the highway departments of adjoining States, the roads of first importance generally meet at State boundaries, and, therefore, become interstate highways of nation-wide utility. The Federal Government, under the present law, is aiding the State highway departments in the classification of their roads on the basis of importance and needs, and Federal aid is rapidly being extended for their improvement, on projects submitted by the States and approved by this department.

The present machinery for supervising road construction is the Federal Bureau of Public Roads, one of the two most efficient agencies of the kind in the world, and the 48 State highway commissions. These, in effect, constitute an expert national commission, intimately in touch through its various parts with all sections of the Union, having no other purpose than that of serving the public interest. It is difficult to see what need there can be for additional or new machinery. Certainly, there is no necessity of creating a separate Federal highway commission or of substituting for the present cooperative program a plan which would commit or limit expenditure to a federally owned and maintained highway system. Such a plan would not meet present needs. There is as yet too much pioneer work required to trust the working out of proper highway policies to a small Federal commission.

Very properly the Federal aid road act places on the highway authorities of the several States responsibility, in large measure, for selecting the roads to be constructed. Obviously the local authorities are in a better position to judge what roads would serve

the largest economic needs than any group of men sitting in Washington would be. It is the duty of the Federal Bureau of Roads, with its district engineers, to see that the provisions of the law are complied with. It is giving, and will continue to give, all possible assistance to the State authorities in all their technical problems, as well as in the planning of State systems and in the classification of roads. It has been the policy of the department from the outset, in order to prevent haphazard action, to have the State highway authorities prepare and present tentative State systems of roads. It was apparent that rigid systems not subject to modifications as conditions might require would be inadvisable. Each State has worked out a system and, in general, it is being followed in the development of projects and the construction of roads. In a number of instances systems in general terms have been adopted by the legislatures. In formulating these systems, the engineers are giving due regard to interstate connections, that is, to roads connecting the system of one State with that of another, and as progress is made the construction of through roads will follow as a matter of course.

PROPOSED CHANGE WOULD MEAN LOSS.

I am convinced that nothing material would be gained by the proposed change. Much would be lost. Many complications would be introduced. The creation of a commission would entail unnecessary additional administrative expenditures and the commission could not do anything that can not be done more effectively by the existing cooperative machinery. I think it is not too much to say that there is a minimum of friction in the relations of the State and Federal authorities and that the majority of the State highway agencies are satisfied with the present arrangement and do not wish a change.

There would also be a radical change of policy. I am of the opinion that the people of the States will not be willing to substitute for the present policy of developing road systems on the principle of serving the broadest economic needs that policy advocated by those whose interest is in main or trunk line automobile roads primarily for touring purposes. The largest service will be rendered, not only to farmers but also to urban people, by following the principle of constructing roads of the greatest economic importance, selected after careful consideration by the State agencies having adequate knowledge and approved by the Federal department. It seems to me clear also that, as the work proceeds, we shall have roads which will be equally serviceable not only to those interested immediately in long-distance automobile travel and motor-truck transportation but also to those interested in getting their farm produce to the market in the easiest and most effective manner and in the transportation of the mails. I clearly

recognize the vast growth and importance of the motor-propelled vehicle passenger and freight traffic. It is estimated that we have 87 per cent of all such vehicles in the world, and we are only at the beginning of their use; but I am satisfied that the development of highways along present lines rather than along the lines proposed will result in their more extensive use. I have no prejudice against any sort of road except a bad road, or against any sort of construction except wasteful and unsubstantial construction. If traffic conditions require heavy construction, then I am in favor of it; and in any case, under the present law, the road must be substantial.

The road movement is growing very rapidly. The Federal aid road act has done much to promote it. Experience has brought about amendments to the law and helpful changes in administration. Comprehensive road programs have been inaugurated. They are being pushed vigorously. They will result, in a shorter time than most people imagine, not only in a network of good substantial roads in the various States of the Union, but also in the requisite interstate highways.

Why at this stage introduce complications and embarrassments? Why should not the friends of the movement for roads to serve the people cooperate? It is difficult for me to see why all who are animated by high public spirit in their thinking concerning highways should not cooperate in the development of present programs and in the perfecting of the existing processes and machinery, instead of attempting to overthrow them. I believe that many of those who are backing the proposed change do not know the facts and are not aware of existing conditions and possibilities.

CONTINUATION OF FEDERAL APPROPRIATIONS.

The period covered by the original Federal aid road act and its amendments will expire with the fiscal year 1921. The results to date clearly point to the desirability of continuing the policy of Federal participation in road building. If this is to be done, it is essential that a decision be reached at an early date, so that the States may be able to make the necessary financial provision and the State and Federal departments make the requisite administrative arrangements. If the financial condition of the Nation permits it, I believe it would be good policy to make available from the Federal Treasury, to be expended under the terms of existing legislation, \$100,000,000 for at least each of the four years beginning with the fiscal year 1922.

PAST ACTION AND FUTURE STEPS.

The promotion of agriculture and the betterment of rural life have, for many years, received the earnest attention and support of State and Federal authorities. Several generations ago the founda-

tions were laid for the two great agricultural agencies, the land-grant colleges and the Federal Department of Agriculture, which have no rivals elsewhere in the world. The State colleges steadily developed until in 1918 they had plants and endowments valued at \$184,400,000, annual incomes aggregating \$47,700,000, and resident and short-course students numbering 123,000, of whom 45,000 were in agricultural courses. Their student body has greatly increased this year. They are now engaged, in cooperation with the Department of Agriculture, in agricultural extension work involving an annual expenditure of more than \$14,000,000. They have been conducting investigational and educational work for many years and have placed in all parts of the Union farm leaders with scientific and practical vision. The Federal Department of Agriculture, whose personnel now numbers more than 21,000, is expending from all sources during the current year \$41,800,000, aside from the \$294,000,000 made available by the original and amended Federal aid road act for the cooperative construction of roads.

As has been repeatedly pointed out, the last five or six years have been especially fruitful of legislation and administrative action looking to the improvement of production and distribution. The principal items are the following:

(1) The Bureau of Markets, excelling in the character and extent of its activities any other similar existing organization.

(2) The Cooperative Agricultural Extension Act, the object of which is to disseminate information among the farmers, mainly through trained agents. As has been indicated, there is now expended annually, from Federal, State, and local sources, more than \$14,000,000 for work contemplated by this act.

(3) The Cotton Futures Act, with amendments, under the provisions of which standards for cotton have been established, the operations of the futures exchanges supervised, and the sale of cotton put on a firmer basis.

(4) The Grain Standards Act, which aims to bring about uniformity in the grading of grain, enable the farmer to obtain a fairer price for his product, and afford him a financial incentive to raise better grades of grain.

(5) The Warehouse Act, which authorizes the Department of Agriculture to license bonded warehouses and which makes possible the issuance of reliable and easily negotiable warehouse receipts, permits the better storing of farm products, increases the desirability of receipts as collateral for loans, and promotes the standardizing of storages and of marketing processes.

(6) The Federal Aid Road Act, as amended, which made available \$294,000,000 for cooperation between the Federal and State Governments in the construction of rural roads. It has conduced to the establishment of more effective highway machinery in each

State and strongly influenced the development of good road building along right lines. It will stimulate larger production and better marketing, promote a fuller and more attractive rural life, add greatly to the convenience and economic welfare of all the people, and strengthen the national foundations.

(7) The Federal Reserve Act, which authorized national banks to lend money on farm mortgages and recognized the peculiar needs of the farmer by giving his paper a period of maturity of six months.

(8) The Federal Farm Loan Act, which created a banking system reaching intimately into the rural districts and operating on terms suited to the farmer's needs. It is attracting more capital into agricultural operations, bringing about a reduction of interest to farmers, and placing upon the market mortgages which are safe investments for private funds.

(9) The Vocational Education Act, which, among other things, provides for cooperation with the States in training teachers of agriculture and in giving agricultural instruction to pupils in secondary schools.

Among other steps which should be taken are the following:

(1) The building up, primarily under State law, of a system of personal credit unions, especially for the benefit of farmers whose financial status and scale of operations make it difficult for them to secure accommodations through the ordinary channels.

(2) Expansion of existing facilities and activities for aiding farmers in marketing, including especially the extension of the market news and food-products inspection services and the assignment of trained market specialists to each State, in cooperation with the State authorities, to stimulate cooperative enterprises and to make helpful suggestions as to plans and methods.

(3) Continuation of the present policy of Federal participation in road building, through the appropriation, if the financial condition of the Nation permits it, of \$100,000,000 for at least each of the four years beginning with the fiscal year 1922, to be expended under the terms of existing legislation.

(4) The regulation and control of stockyards and packing houses.

(5) Federal legislation further to protect consumers against misbranded, adulterated, and worthless feeds entering into interstate commerce.

(6) Similar legislation dealing with fertilizers.

(7) Increased support by States for rural schools and more definite direction of their instruction along lines related to rural problems and conditions.

(8) The requisite legislation for the improvement of the sanitary conditions in rural districts and for the building up of the needed hospital and medical facilities.

NEED FOR BROAD SURVEY OF RURAL CONDITIONS.

Present conditions, and particularly present states of mind, indicate the need of a fresh, broad survey of rural life, of its special problems, and of its relationships. It should be viewed as a whole. A comprehensive flexible program should be developed for the guidance of the different agencies, each of which has its peculiar functions and responsibilities. Furthermore, the principles and purposes governing agricultural life and agencies should be set forth for the education of the American public, particularly the urban part of it. The Nation as a whole needs a fuller appreciation of its basic industry, and a more definite sense of direction of its efforts to foster it. Many agencies are now following more or less well defined, helpful plans of their own devising, but these are at best piecemeal, and there is confusion of leadership and objectives. A program made by any one element would be partial and unsatisfactory. We should have a meeting of minds of all those directly concerned, of farmers, of agricultural leaders, and of business men.

You have already indicated your intention to call a conference at which there will be not only a generous representation of farmers but also of agricultural agencies and organizations and of business interests which have an intimate relation to farm problems. I believe that, because of changed conditions here and elsewhere, of existing uncertainties, and of disturbed states of mind, this conference should be called at the earliest possible date. It may be that, as one outcome of it, the creation of a rural life commission, with a temporary or a permanent status, will be determined to be in the public interest. Certainly, the best means of fostering our basic industry can not too frequently receive definite consideration by the best minds of the Nation.

Respectfully,

D. F. HOUSTON,
Secretary of Agriculture.

The PRESIDENT.

REPORT OF THE CHIEF OF THE BUREAU OF ANIMAL
INDUSTRY.

JOHN R. MOHLER, *Chief of Bureau.*

ACTIVITIES RECEIVING SPECIAL ATTENTION.

INFORMATION ON FOREIGN LIVE-STOCK CONDITIONS.

To aid the live-stock industry in meeting changed international conditions following the armistice, the Bureau of Animal Industry has given close attention to a number of special problems. An

animal-production committee was formed to make a thorough study of meat animals and necessary plans whereby American farmers could supply the quantities of meat food products required. This work is being continued. To obtain accurate information on current live-stock conditions abroad, three representatives of the bureau visited Europe at different times during the year. Their observations in five countries were published through the news channels of the department.

The bureau has also issued statements through addresses and the press, outlining the position of the United States in relation to the world at large with respect to supplies of cattle, sheep, and swine. In addition, a circular, "The Trend of the Dairy Cattle Industry in the United States and Other Countries," was published. This shows by simple charts the advance or decline of cattle raising in the principal countries of the world from 1850 to 1918. This publication was followed by two others of similar character, one dealing with the butter and the other with the cheese industry.

LIVE-STOCK EXPORT REGULATIONS REVISED.

During the fiscal year the bureau, which issues export certificates for live stock, adapted its regulations to meet changed conditions. In their new form they facilitate materially the safe and humane handling of domestic animals, especially dairy cows and breeding cattle carried on ocean steamers.

By contributing to the arrival of the stock in the best possible condition, the revised regulations are a factor leading to a continuance of our export trade in live stock. During the year numerous shipments of both cattle and swine were made to South American points under export certificates issued by the bureau.

PROGRESS IN DISEASE CONTROL.

The long and anxious campaign which the bureau has been waging against animal diseases brought encouraging results during the last year. From a scientific point of view, victory over most of these maladies is in sight, and in a number of cases eradication is nearly complete. (See accompanying charts.)

Cattle scabies, which in 1906 was prevalent in nearly one-half of the United States, now appears only as outbreaks in limited areas. These outbreaks are being suppressed.

Eradication of sheep scabies, which in 1906 existed in more than one-half of the land area of the country, is now about nine-tenths complete.

The cattle tick which causes Texas fever has had its domain reduced from more than 700,000 square miles in 1906 to less than 300,000 square miles in 1918. Progress has been continuous year after year.

Hog cholera presents a somewhat different problem, as the nature of the disease makes the campaign of a sporadic character. But the use of antihog-cholera serum, especially in connection with virus, is a definite means of preventing serious outbreaks.

Recent investigations have shown that the common intestinal roundworm of the pig is not only injurious as an intestinal parasite but that during an early stage of its development, while still micro-

scopic in size, it invades the lungs and may give rise to serious troubles. Furthermore, pigs that survive this invasion of the lungs may never fully recover, but fail to grow properly, and become unprofitable runts. It is believed that much of the damage caused by the intestinal roundworm can be avoided by simple sanitary precautions, the practical application of which is now being tested. The problem of so-called "mixed infection" is also under investigation, with the view of determining more definitely its relation to hog cholera and the proper measures of control.

The United States has remained free from foot-and-mouth disease, and the bureau continues to exercise vigilance against its possible introduction. Serious outbreaks in foreign countries have been closely studied, and bureau inspectors have given special attention to cargoes of live-stock products from such countries, importations of the animals themselves not being permitted.

A questionnaire inquiry made among stockmen and State officials indicates an almost universal support of the method which the bureau employed successfully in stamping out past outbreaks of foot-and-mouth disease by slaughter of the animals affected.

Eradication of tuberculosis has progressed as fast as the work could be handled by the veterinary force employed; in fact, there has been a waiting list of herds to be tested. Under present authority from Congress only one-third of the appropriation for tuberculosis-eradication work can be used for operating expenses, the remaining two-thirds being allotted for the payment of indemnities. A reversal of the ratio, making available two-thirds for operating expenses, would increase greatly the progress of the work. Necessarily the diseased animals must be found before indemnity can be paid, and when only a few animals in a large herd react to the test the operating expenses exceed the Federal share of indemnity. Yet, finding those few reactors promptly before the disease spreads is essential to maintain the herd in a healthy condition.

The bureau now conducts tuberculosis-eradication work cooperatively with the officials of 43 States, and negotiations are in progress to extend the work to others. The District of Columbia is an excellent example showing that the disease is vulnerable to a definite campaign of eradication. In 1907 tuberculin testing in the District was undertaken, and more than 18 per cent of the cattle were found to be tuberculous. Tests made in 1919 on all cattle in the District showed a percentage of only 0.63 of 1 per cent affected. This is lower than in any previous year, and the disposal of the last reactors makes the District practically a tuberculosis-free area.

SECOND ACCREDITED LIST ISSUED.

During the year the bureau issued Herd List No. 2 of cattle officially accredited as free from tuberculosis and containing also a list of herds that successfully passed one test with a view to certification. Compared with list No. 1, dated July 1, 1918, the second list shows noteworthy progress as follows:

Accredited-herd list summary.

List.	Cattle accredited.	Cattle once tested without reactors.
List No. 1, July 1, 1918.....	6,945	22,212
List No. 2, April 1, 1919.....	19,021	97,243

From April 1 to the end of the fiscal year further progress was made, and the work is receiving hearty support from live-stock owners and officials.

CONSTRUCTIVE SIDE OF REGULATORY WORK.

Disease eradication is the basis of ample production and in final analysis of liberal consumption and proper nutrition. If the live-stock men of the country had to contend with pleuropneumonia, foot-and-mouth disease, surra, rinderpest, and other animal scourges on top of their present problems, production certainly would fall and consumption would be curtailed by reason of high prices necessary to cover the risks of production. Fortunately, this list of diseases may be considered a problem already solved. They do not exist in this country and the bureau is on the alert to keep them out.

The bureau has also taken energetic steps to check attempts at shipping diseased stock interstate, and perfected and strengthened its regulations especially with regard to bovine tuberculosis.

Coupled with those efforts, and to acquaint stockmen with the constructive side of the work, it has pointed out at frequent intervals the purpose of the regulations. As a result closer cooperation is developing between the public and the bureau's inspectors and veterinarians—a condition helpful to the effectiveness of field work.

MEAT INSPECTION RENDERS LARGE SERVICE.

The Meat Inspection Division set a new high mark in the extent of its service to the public. During the year more than 70,000,000 animals were slaughtered under Federal inspection, an increase of about one-fifth over last year, and also over the average of the last 12 years. Besides the bureau completed a survey of municipal and State meat inspection, and is prepared to aid cities in inaugurating or improving local supervision over their meat supplies.

IMPROVEMENT IN QUALITY OF LIVE STOCK.

From records collected it appears that the per capita meat consumption in the United States is increasing. This condition and the increase in population of the country point to the need for closely studying methods of production, especially with a view of making them as economical and attractive as possible. A similar problem exists regarding dairy and poultry products.

To establish and disseminate information on sound principles of production the year's work included numerous experiments in feeding, breeding, and care of stock. An extensive breeding experiment

with dairy cows has been undertaken cooperatively with two States. Results of many years of cow-testing work in all parts of the country were compiled, condensed, and prepared for publication. Poultry culling as a practical means of improving the average egg production has received special attention.

In all classes of live stock the value of purebred sires of good type has become so evident that a special campaign has been undertaken to place the facts before the public and enlist efforts to use purebred sires. In cooperation with the various agricultural colleges, live-stock associations and similar organizations, the bureau formulated plans for the work applicable to all parts of the country, and the campaign was inaugurated, effective October 1, 1919, under the slogan "Better Sires—Better Stock." Briefly, it provides (1) official recognition for live-stock breeders using purebred sires in all classes of stock; (2) a means of recording prominent breeds and varieties in States and counties; and (3) printed information on successful breeding methods suitable to average farm conditions. Every live-stock owner is eligible to enrollment in the campaign, the purpose of which is to banish scrub and inferior sires from the United States.

LITERATURE.

During the year 83 new publications were issued or contributed by the bureau. These include 15 Farmers' Bulletins, 10 Department Bulletins, 8 contributions to the Department Yearbook, 12 issues of Service and Regulatory Announcements, 8 articles for the Journal of Agricultural Research, 22 miscellaneous pamphlets, and 8 orders in the nature of regulations. In addition 247 articles relating to the work of the bureau were published in the Weekly News Letter.

REPORTS BY DIVISIONS.

The year's work as conducted by the various divisions of the bureau is presented more fully in the following pages:

ANIMAL HUSBANDRY DIVISION.

The war work of the Animal Husbandry Division, under George M. Rommel, chief, fell under two main heads—the emergency movement of drought-stricken live stock and the campaigns to stimulate production of hogs, poultry, beef cattle, and sheep. The conservation feature was quite as strongly emphasized as the importance of actual increase in production.

SAVING DROUGHT-STRICKEN CATTLE.

The shipment of cattle from drought-stricken areas was aided in the summer of 1918 as in the preceding year. The movement was principally from Texas to the Southeastern States, and nearly 300,000 head were shipped. The cattle were mostly cows, and a large proportion were bought outright in small lots and went into a section which promises to be our next great area for expansion in beef production. Where they were properly cared for they gave farmers a start of from 5 to 10 years over the usual methods of grading up native stock by purebred bulls. It cost the Government only a few cents a head to move these cattle. If these well-bred cattle had not

been moved as they were, they would have perished on the ranges or would have been slaughtered at the market centers.

In the summer of 1919 a similar movement of wide scope was undertaken to meet a similar situation in Montana and adjoining States. The work is in charge of a committee representing the Bureau of Animal Industry, the Bureau of Markets, and the States Relations Service, in cooperation with the agricultural colleges and the United States Railroad Administration.

STUDIES OF ANIMAL PRODUCTION.

The committee formed in the Animal Husbandry Division to study meat-animal production throughout the world as a war-time measure has continued its work. In the statistical part of its researches it had the hearty cooperation of the Bureau of Crop Estimates. The purpose was to prepare a program for animal production in 1919 which would meet the demands of the Allies and be practicable of application by our farmers. The essence of the committee's report was adopted in the department's recommendations published in the fall of 1918. The committee has devoted some study to the same subject for 1920, and it is the intention to continue this study of world meat production annually so far as resources permit.

BEEF-CATTLE INVESTIGATIONS.

BEEF PRODUCTION.

The beef-cattle experimental work was continued in Mississippi, North Carolina, and West Virginia, in cooperation with the State agricultural colleges, and on the Animal Husbandry farm at Beltsville, Md. In the steer-fattening experiments rations with only a small amount of concentrates were used. Nitrogenous supplements were used liberally, but the amount of grain was reduced to a minimum. Limited grain rations were used with satisfactory results, which indicates that beef can be produced economically largely on roughage when supplemented with a protein-rich feed.

BEEF-CATTLE EXTENSION.

Beef-cattle extension work was an important part of the movement to increase production. The extension specialists worked in all sections of the country, but much of the work was done in regions where the beef-cattle industry is practically new. The States included were Alabama, Arkansas, Florida, Georgia, Iowa, Mississippi, North Carolina, North Dakota, Oregon, South Carolina, Tennessee, Texas, New Mexico, and Virginia. The work was done in cooperation with the State agricultural colleges through their extension divisions, and particularly with the county agricultural agents.

The elimination of scrub bulls and replacing them with purebreds was advocated. The specialists placed a total of 1,408 purebred bulls, 1,981 purebred cows, and 11,291 grade cattle, in addition to approximately 150,000 head of cows and steers brought in from the drought area in the southwest. Many sales were conducted under the direct supervision of the beef-cattle specialists. The cattle for these sales were usually inspected and the undesirable ones eliminated. Fifty-

nine live-stock breeders' associations, with a reported membership of 1,524, were organized. Numerous calf clubs were organized among the boys and girls. The specialists held 464 meetings at which they addressed 23,633 people in the interest of better live stock. They also did some useful work in demonstrating the value of pasture and in giving advice on the growing of winter feeds and the planning of winter rations.

BEEF-PRODUCTION DEMONSTRATIONS.—Three hundred and seven demonstrations of various kinds were conducted to show the most approved methods and practices in beef production, including feeding, judging, dehorning, fitting animals for shows and sales, and other subjects. Thirty-nine herdsmen's courses were given. Each specialist conducted a number of steer-fattening demonstrations. One of these, on a Georgia farm, was of special interest because the cattle had been shipped from the drought-stricken area of Texas. Ninety-two head averaging 700 pounds were fed for a period of 101 days and made an average daily gain of 2.57 pounds. They cost \$10.50 per hundredweight and sold for \$12.50 per hundredweight. With this margin there was an average profit per steer of \$16.32. The feed cost per 100 pounds of gain was \$11.31.

SWINE INVESTIGATIONS.

Twenty-three purebred sows of six breeds and four purebred boars of four breeds were bought for the Beltsville farm. Sows saved for breeding purposes from those raised on the farm increased the number of brood sows in the herd to 38.

SWINE HUSBANDRY EXTENSION.

Fifty-six field men were employed in extension activities in swine production, which included pig-club work and the emergency pork-production campaign.

PIG CLUBS.—Cooperative work in connection with boys' and girls' pig clubs was conducted in 25 States, where there was an enrollment of 72,608 members, or an increase of 102 per cent over the year before. Complete reports were received from 11,593 members. The fact that the pig-club membership has doubled in the last year is only a slight indication of the zeal with which the boys and girls responded to the plea for increased meat production. A large percentage of the club members raised more than one pig, and there was a great increase in the number of sows and litters raised.

EMERGENCY PORK-PRODUCTION CAMPAIGN.—The Animal Husbandry Division undertook to aid in bringing about the production of sufficient pork and lard, with special attention to the needs of the Army and the Allies. It is only fair to say, however, that the Food Administration's influence on prices was one of the principal factors in maintaining and increasing production. Swine specialists of the Animal Husbandry Division cooperated with the State extension forces, county agents, and other agencies. In the Corn-Belt States the work was carried on as a separate enterprise, while in many of the Southern States it was associated with the pig-club work. Among the measures advocated were better feeding methods, the use of self-feeders, the growing of suitable forage crops, the improvement of quality of hogs, the production of fall as well as spring litters of pigs, the formation of breeders' associations, and the home

killing and curing of pork. Demonstrations in the use of the self-feeder and of forage crops were conducted in many counties, and the farmers were brought together at the demonstration farms to see the results. There was a big increase in the number of fall litters raised in 1918. In the efforts to promote the raising of better hogs, especially in the Southern States, the swine specialists assisted the farmers in purchasing breeding stock and in selecting the best animals from their herds for breeding purposes. The home killing and curing of pork was encouraged by demonstrations and by exhibits at fairs. The Negro farmers of the South received special attention in this respect, and great improvement in the quality of meat cured by them has resulted.

MOVEMENT OF FEEDER HOGS.

Because of a shortage of feed resulting from the drought in the Southwest, a great number of light hogs weighing from 60 to 125 pounds were shipped to market at a time when they should have been fattened. The bureau undertook to aid in having these hogs utilized as feeders, in cooperation with the Bureau of Markets, the live-stock markets, the various State extension forces, and local organizations.

Two methods were used. One was to have a representative visit the various stockyards and make arrangements to have the feeder hogs received, sorted, vaccinated, and disinfected. Then by publicity campaigns and correspondence, farmers desiring feeder hogs were informed when shipments of such animals could be expected and were invited to come and select their feeders. The other method was for the county agent to procure lists of farmers having feeder hogs for sale and send them to the State director of extension. Inquiries for feeder hogs were also sent to the extension office, and purchaser and seller were thus brought together. While definite statistics are not available, it is certain that more than 100,000 feeders were shipped into the Corn Belt as a result of this campaign.

FISHERY BY-PRODUCTS AS HOG FEED.

For several years the Animal Husbandry Division has been co-operating with the Bureau of Fisheries in studying the use of fish meal as a protein feed for swine. As a hog feed this material has been found to be equal to high-grade tankage, of which the supply is inadequate. During the year a new product known as shrimp bran was studied. The results of tests with this product as compared with fish meal, the remainder of the ration being shelled corn and middlings, were very favorable.

SHEEP AND GOAT INVESTIGATIONS.

FARM-SHEEP INVESTIGATIONS.

Experimental work with farm flocks of sheep is carried on at the bureau's farms at Beltsville, Md., and Middlebury, Vt.

At Beltsville a study is being made of specialized intensive sheep raising with complete reliance upon forage crops for summer pasturage. In 1916 a 30-acre area did not produce sufficient forage to feed satisfactorily 44 Southdown ewes and 33 lambs. This field is now capable of furnishing sufficient summer feed for 100 ewes with their lambs. The improvement is due in part to the application

of manures, lime, and phosphates, but chiefly to the fact that leguminous crops were largely used and all crops were fed upon the ground, the unused residues being plowed in. The results show clearly the possibility of a profitable sheep-raising business upon eastern lands under a system of seeding a rotation of forage crops and allowing such frequent changes of pasture as are necessary to prevent parasitic troubles.

EMERGENCY WORK IN SHEEP HUSBANDRY.—On account of the great importance of an increase in wool and lamb production during the war, the work on farm sheep demonstrations was supplemented by emergency extension work in Arkansas, Florida, Idaho, Illinois, Indiana, Kansas, Louisiana, Michigan, New Hampshire, North Carolina, South Dakota, Tennessee, Texas, and Vermont, under cooperative arrangements with the extension departments of the State agricultural colleges. The chief duty of the bureau's specialists was to aid the county agents in giving advice and direction to persons inexperienced in sheep raising and in endeavoring to bring about the largest possible returns of wool and meat from older flocks. A large number of new flocks were established. Demonstration meetings were held to explain how to select breeding ewes and rams, how to shear the sheep and prepare the wool for market, docking and castrating lambs, and proper management for procuring the maximum growth of lambs and for maintaining the health of the flock.

HORSE AND MULE INVESTIGATIONS.

BREEDING AMERICAN CARRIAGE HORSES.

The cooperative agreement with the Colorado experiment station at Fort Collins for experiments in breeding American carriage horses terminated June 30, 1919. July 1, 1919, the work was transferred to Buffalo, Wyo., where it will be conducted in cooperation with the State of Wyoming as a project for the development of a horse of general utility adapted to western range and farm conditions. Prior to terminating the work at Fort Collins the stud consisted of 7 aged stallions, 2 4-year-old stallions, 1 3-year-old stallion, 2 2-year-old stallions, 20 aged mares, 2 4-year-old mares, 7 3-year-old mares, 10 2-year-old fillies, and 13 1-year-old fillies, a total of 64 animals. Twelve stallions and 25 mares and fillies were selected for retention in the stud to be transferred to Wyoming. The remaining 27 animals were retained by the Colorado station.

The standard-bred stallion Harvest Aid 63908 was purchased by the department last spring and added to the stud. This stallion is a brown three-year-old, standing 15.2½ hands and weighs 1,180 pounds in his present form.

BREEDING MORGAN HORSES.

The breeding of Morgan horses at the Morgan horse farm, Middlebury, Vt., is progressing very satisfactorily, and uniformity is being attained in the animals produced. At the close of the fiscal year there were 9 mature stallions, 11 young stallions, 30 mares and fillies, and 7 geldings (including 3 draft-work geldings), a total of 57 animals. Sixteen animals were eliminated from the stud on account of being unsuitable for breeding purposes, and two died. Four of the mature stallions were sent out to various sections of Vermont for use in the Army horse-breeding work. The mare Grief, by

Snoqualmie and out of Gertrude, was added to the stud October 31, 1918.

The test in feeding weanling colts grain and hay ad libitum has given excellent results in maximum growth and development without harmful effects. The average daily feed consumed by the colts in this test was as follows: Oats, 8.52 pounds; bran, 3.39 pounds; alfalfa, 3.25 pounds; timothy, 4.91 pounds.

POULTRY INVESTIGATIONS.

POULTRY FEEDING.

Experiments in feeding hens for egg laying are in progress at the Beltsville farm in 27 feeding pens, 25 of which contain 30 hens each and 2 contain 50 hens each. The results of 1918 on the high vegetable protein rations were not entirely satisfactory. New experiments are being conducted this year in reducing the amount of the vegetable protein (soy-bean meal, peanut meal, and velvet-bean meal) and increasing the animal protein (meat scrap). The mash fed last year contained 10 per cent each of vegetable and animal protein, while this year the new pens receive 15 per cent meat scrap and 5 per cent of the high vegetable protein feed. Up to the close of the fiscal year the egg yield had continued good and had not been adversely affected by the summer weather, as was the case with the ration fed last year. The birds in the pen receiving peanut meal have slightly outlaid the others, being followed by those receiving soy-bean meal and velvet-bean meal in the order given. Apparently the ration being used this year is a considerable improvement over the one previously used. The pen receiving 10 per cent of cottonseed meal and meat scrap in the mash continues to give good results.

The experiment with feeding garbage is being continued through its second year with a fairly good egg yield but with excessive mortality, due apparently to the garbage. The pen on cooked vegetables with a rather light grain ration laid fairly well during the first year and is also laying particularly well the second year. Continued good results are being obtained on the ration which does not contain any wheat. Special tests on using one feed and its by-products supplemented with meat scrap, including such feeds as oats, barley, and corn, are being tried with fair results, but are not giving as good results as where two grains are used. Continued data on the feed cost of producing eggs from different breeds on different rations are being accumulated.

POULTRY BREEDING.

Practically all the hens on the farm, whether in feeding or breeding pens, are trap-nested, and all the chicks are pedigree hatched, so that their parents are known. In breeding for egg production the plan has been to continue matings of females of good production to males out of good producing females, at the same time selecting for quality in standard requirements.

In the experiments in grading up mongrel flocks by the continued use of purebred males the third generation of grades has been obtained and bred. The Barred Plymouth Rock grades show marked uniformity in color and type, and the White Plymouth Rock grades show improvement in this respect but do not yet all come pure white in color. In both kinds of grades individuals occur which so closely resemble purebreds that it is impossible to tell the difference by their appearance.

Further progress has been made in the difficult work of establishing a new breed with the combination of characters desired.

In carrying on the breeding work 70 different matings were made and about 3,000 chicks were hatched. The installation and operation of a mammoth incubator has helped greatly in the hatching.

PIGEON AND SQUAB INVESTIGATIONS.

The pigeon investigations have been continued along the lines previously followed, giving another year's data on the cost of raising squabs for market from the different varieties of pigeons commonly kept for that purpose. Investigations in the breeding and training of homing pigeons are being continued.

TURKEY AND GUINEA INVESTIGATIONS.

Information regarding the raising of turkeys and guinea fowl is being collected from time to time so that bureau publications on these subjects may be kept up to date.

POULTRY EXTENSION.

The emergency campaign to stimulate poultry production, carried on in cooperation with the State extension forces, begun in the fall of 1917, was continued throughout the past fiscal year. Since the signing of the armistice the efforts have been directed toward more efficient methods rather than to concentrate entirely on increased production. The work was carried on in 29 States by 41 field men. In 1919 there was reported from 21 of these States an average increase of 26.5 per cent in poultry production over the preceding year; 5 States reported a normal production, 1 slightly above normal, and only 2 showed a slight decrease, due principally to the high cost of feeds as compared with the price received for the finished products.

POULTRY CLUBS.

Nine poultry-club agents or specialists working in 8 States in the calendar year 1918 supervised the conduct of 2,151 boys' and girls' poultry clubs with an enrollment of 31,095 members, an increase of 107.3 per cent over the preceding year. These club members hatched 320,869 chicks and raised 233,123 mature fowls. They produced \$146,529.09 worth of poultry and eggs for market and breeding purposes, and the total value of their receipts and stock on hand at the end of the year amounted to \$403,690.46. One hundred and thirty-five poultry-club exhibits were held, at which 1,405 members exhibited 4,825 birds and 447 dozen eggs, and the total amount of special and cash prizes awarded to the members making these exhibits amounted to \$4,388. The average profit per member reporting was \$23.53.

ANIMAL GENETICS.

The inbreeding of guinea pigs has been carried to the twentieth generation wholly by mating brother with sister. Crossbreeding experiments, with the inbred families as material, have now been carried on for more than three years. The results of the past year are in agreement with those for the previous years. No very obvious degeneration has appeared in the inbred stock. There has, however,

been some decline in vigor. Fertility, including both size and frequency of litters, has suffered the most. Experiments on the resistance to tuberculosis of the different inbred families and of the crossbreds have been begun in cooperation with the Phipps Institute, of Philadelphia. A new statistical method has been developed in connection with investigations on the relative importance of the various factors which determine coat color, rate of growth, etc.

ANIMAL HUSBANDRY EXPERIMENT FARM.

Besides the experimental work carried on at the Animal Husbandry Division farm at Beltsville, Md., the general development of the farm has been continued. Progress has been made in drainage, completion of buildings, water system, soil improvement, improvement of grounds, and several minor projects. Drainage of all except woodlands has been completed; 16,649 feet of drain tile were laid during the year, making a total of 78,191 feet laid since the farm was acquired. All the large buildings and most of the portable houses have been newly painted.

CERTIFICATION OF ANIMALS IMPORTED FOR BREEDING PURPOSES.

Under the provisions of paragraph 397 of the tariff act of October 3, 1913, certificates of pure breeding were issued for 168 horses and 92 dogs.

DAIRY DIVISION.

On account of the high cost of feed and other materials used in dairying, the Dairy Division, under B. H. Rawl, chief, has given special attention to economical production through the use of improved dairy cows and proper feeding. To improve the dairy cows the use of better sires and the selection of cows has been encouraged by the promotion of bull associations and cow-testing associations, and this work has met with a hearty response from the producers. Bull associations, which make it possible for owners of small herds to have the use of good bulls and at the same time to utilize good bulls to the fullest advantage, have been especially successful. Extensive breeding projects have been begun at the Dairy Division experiment farm at Beltsville, Md., and also in cooperation with various States, for the purpose of determining the principles of breeding for establishing high-producing herds.

Much time has also been devoted to encouraging the fuller utilization of milk and milk products, and a special campaign was carried out to increase the consumption of milk where a surplus of this product was found. Improvement of dairy products has been undertaken by emphasizing the importance of sanitation on the farm and the necessity for the thorough cleaning of dairy utensils. Investigations in economy of production, such as fuel and steam utilization in factories, have been continued. Studies in the manufacture of foreign varieties of cheese have been extended and results of several years of experimentation with Swiss and Roquefort cheese have been put into practical use in the manufacture of these cheeses on a commercial scale.

Efforts were made to assist in war work with all facilities at the division's command. Surveys and inspections of milk supplies were

made in Army cantonments, and assistance was rendered the Navy Department through the inspection of butter. Work was done also on other war problems.

DAIRY EXTENSION.

Extension work in dairying serves to carry this industry into new sections, to introduce new practices developed as the result of research, and in general to unify methods throughout the United States. This work is generally carried on in connection with various State agricultural colleges. Cow-testing-association and bull-association work are the chief lines of activity.

SOUTHERN DAIRYING.

Efforts of the extension forces have been directed toward general dairy advancement in the South and the building up of a cheese industry in the mountain sections. Among the more important specific accomplishments have been the organization of 21 bull associations and 7 new cow-testing associations, reorganizing 5 cow-testing associations, assistance in the purchase of 1,849 head of cattle (among which were 169 purebred bulls and 771 purebred females), and the erection of 64 silos, 48 new barns, and many other smaller buildings. The great popularity of bull associations and the large number of dairy cattle brought into the Southern States give evidence of interest and progress in the improvement of dairy stock. Good results of the work for the development of the creamery industry are the growing popularity on the market of Mississippi butter and the fact that local creameries of central Tennessee are proving successful. The benefits of eradicating the cattle ticks are being realized more and more in the advancement of the dairy industry.

WESTERN DAIRYING.

During the first half of the fiscal year the extension work for the development of the dairy industry in the Far West was continued under unfavorable conditions, such as a shortage of labor, high prices of feed, and uncertain markets. Later, however, conditions were much improved. Dairy stock has been in great demand and there has been a widespread movement among producers to obtain purebred bulls. As a result of good cooperation among Federal, State, and county agents, cow-testing work has been given renewed life, bull-association work has been extended, and considerable interest has been taken in the utilization of creamery by-products. Silo construction has made greater progress than during any previous year. Agents of the Dairy Division assisted directly in the erection of 500 silos, which represent only a small part of the total number erected.

COW-TESTING ASSOCIATIONS.

Cow-testing associations, the formation and operation of which are encouraged and supervised by the Dairy Division, are made up of groups of dairymen who collectively hire a tester to keep records on production, butterfat test, and other data concerning each cow. During the first half of the fiscal year practically all testers were in military service and the work of the associations suffered severely.

Since the return of the soldiers to civil life there has been a revival of association work and a marked increase in the number of active associations. The total number of associations that were active July 1, 1919, was 385, representing 10,000 herds with 167,313 cows, compared with 353 associations active July 1, 1918, representing 9,778 herds with 168,348 cows. Oklahoma, South Carolina, and Texas reported active associations for the first time. Wisconsin continues to lead in the number of associations, with a total of 103, Pennsylvania ranking second with 38, Illinois third with 27, and Ohio fourth with 25. The associations continue to practice extensively the cooperative buying of feed. In Michigan an agent in dairying selected feeds for one association which resulted in a saving of \$3,000.

STUDY OF COW-TESTING RECORDS.

The tabulation of records of 38,532 dairy cows from 110 cow-testing associations is nearing completion. The tabulations have brought out a number of interesting relations between milk production, butterfat test, butterfat production, and income over cost of feed. The average milk production was 5,936 pounds per cow and the average butterfat production 246 pounds. For each 50 pounds increase in production of butterfat there was an average increase of \$15 in income over cost of feed. In the case of each breed an increase in the use of the butterfat test was accompanied by an increase in butterfat production and by a decrease in milk production. The larger cows excelled the medium and small cows in production of milk and butterfat. The results of this work are being prepared for publication.

COOPERATIVE BULL ASSOCIATIONS.

Bull associations have been found an inexpensive but very successful means of improving dairy cattle, and have therefore been very popular in sections where dairying is a new industry and the farmer's resources are limited. A greater number of really substantial cooperative bull associations have been formed this year than in any previous year since the movement started in this country, for out of a total of 82 associations now in operation 40 were organized during the past year. This work has been especially successful in the South. Requests for assistance from many States resulted in the selection of Georgia, Alabama, Mississippi, Louisiana, Texas, and Tennessee for association work. Associations were formed in each of these States except one. Work in the Western States was hampered by the lack of a director part of the year, but during the last six months of the year four substantial associations were organized, one each in Montana, Washington, Wyoming, and Oregon.

COMMUNITY DEVELOPMENT IN DAIRYING.

The project in community dairy development at Grove City, Pa., which was organized a few years ago as a means of demonstrating the value of intensive work in developing dairy communities, has now passed the experimental stage and has shown its value as a constructive influence in dairying. Many farmers, county agents, and bankers from all over the country have made inquiries or have visited Grove City with the idea of undertaking similar develop-

ment in their localities. In this enterprise the department has worked in cooperation with patrons of the creamery, and with the local breeders' associations, the commercial club, and the local banks. The past year witnessed the building of 21 silos and the improvement of farm buildings of 112 of the creamery patrons.

The accredited-herd plan for eradicating tuberculosis and maintaining herds free from that disease has been well received. In the Grove City area 327 herds are under supervision of the Bureau of Animal Industry and the Pennsylvania State live-stock sanitary board. Four new clubs having for their object the development, improvement, exhibition, and sale of tuberculosis-free cattle have been organized.

Other cattle clubs organized in previous years have generally shown increased membership. The cow-testing association has been reorganized with 39 members and 411 cows. Interest in purebred dairy cattle has continued to increase; 58 of the creamery patrons purchased 133 registered dairy females and 48 patrons purchased purebred bulls.

SUPPRESSION OF INFECTIOUS DISEASES IN DAIRY HERDS.

In connection with the work relative to cow-testing and bull associations, work of an educational nature has been done to further the prevention and eradication of tuberculosis and contagious abortion. Such work has been carried on in many States and has contributed to the marked popularity of the accredited-herd plan. In herds of these associations tested for tuberculosis by the Tuberculosis Eradication Division of the bureau, it was found in most cases that only a small per cent of the cows were diseased, but the elimination of the few disease spreaders before the herds could become badly infected was of great benefit and undoubtedly prevented later losses.

DAIRY DEMONSTRATION FARM, DENISON, TEX.

For several years a dairy farm near Denison, Tex., owned by a group of local businessmen, has been operated as a demonstration of the value of dairying under certain local conditions. This project was terminated during the year by the sale of the property by the owners, there having been a material increase in land values in that region as a result of oil development. During the last year of the project considerable terracing was done and many additions to equipment, improvements, and repairs were made from the earnings of the farm. The oat crop yielded well and the alfalfa crop was satisfactory, but the corn was only fair, because of dry weather.

STIMULATING PRODUCTION AND UTILIZATION OF DAIRY PRODUCTS.

In order to stimulate the production and consumption of milk and milk products for human food an educational campaign was carried on in numerous cities and small towns of the Northern States. This work was done principally among women. The objects were (1) to eliminate waste by a more comprehensive and varied utilization of dairy products, (2) to improve and enlarge the food supply, and (3) to encourage the dairy industry. The Dairy Division cooperated with the various States through the States Relations Service. The

campaign was divided into two major projects, one dealing with the larger cities in States where a milk surplus was reported, and the other with the smaller towns and rural districts.

In the city campaigns a wide variety of methods was used, depending largely on local conditions. In general, however, the process consisted in obtaining a large degree of cooperation from the city authorities, health boards, etc., together with talks and demonstrations in schools, factories, and department stores. In many cases attractive exhibits were placed in store windows and extensive use was made of publicity through press notices or paid advertising. Posters showing the food value of milk were also used effectively.

An example of such a campaign is the work done in Detroit, Mich., where it was found that there was a 30 per cent surplus of milk during the spring months. To utilize this surplus and at the same time to increase the consumption of milk and dairy products an extensive campaign was organized. Thirty-five thousand circular letters were sent out to leading citizens, and cooperation was received from 20,000 club members, the principals and teachers of the city schools, visiting housekeepers, welfare workers, clergy, physicians, hotels, restaurants, etc. A total of 371 lectures were given in schools, reaching 69,000 children directly and their parents indirectly, and the visiting nurses and visiting housekeepers carried the message to thousands of homes. Congregations of 65 churches listened to milk sermons, and thousands of factory employees and newspaper readers were also reached. Ten thousand posters were distributed and multitudes of people viewed window exhibits. As a result of the campaign a large per cent of the milk surplus was absorbed, milk sales increased, and sales of butter and cottage cheese increased materially. The board of health placed a high value on the campaign as a means of improving the health of the city. Similar campaigns were carried out in 16 cities of five States.

For the rural and small-town campaigns, agents in dairying were appointed for State-wide work in Iowa, Kansas, and Utah. In organizing the work in those States it was agreed that the colleges of agriculture were to train dairy workers. The extension departments, home demonstration agents, and in some States the county agents and club agents assisted with the work. The work in Iowa affords an example of how this type of campaign was conducted. In that State the value of milk was brought to the attention of school children by having them write essays on the subject, and 4,500 families were reached in this way. In the schools at Ames and Des Moines the value of milk as a food was demonstrated through tests in feeding fixed quantities of milk to a number of abnormal school children for periods ranging from 2 to 3 months. In all cases the results showed that milk caused additional gains in weight, and in many cases the children were reported by their teachers to be more alert mentally and easier to handle. In northeastern Iowa an educational campaign was conducted among rural schools and homes and resulted in an awakening among children and parents as to the value of milk as a food.

Efforts of the women dairy agents and of others who have helped in conducting farm-home dairy work in Southern States have been directed toward greater production of milk and more liberal use of milk and dairy products in the diet. Since a certain amount of milk

is usually made into butter on the farm, demonstrations and instruction in improved methods of buttermaking have been given to farm women. The increase in production and use of milk was accomplished through the "Buy a cow" campaign, instruction in the care and feeding of cows and the proper care of the milk, demonstrations in cooking, buttermaking, and cheesemaking, and exhibits of dairy products.

As a result of this work, 41,000 families are now using more milk for drinking and cooking, 448 family cows have been purchased, and 1,042,542 pounds of cottage cheese were made by farm women. An indication of the interest aroused in modern methods of dairying is shown by the purchase of 16,247 pieces of improved dairy equipment. Exhibits and contests have also done much to stimulate interest in more and better dairy products.

DAIRY-MANUFACTURING INVESTIGATIONS.

CREAMERY IMPROVEMENT.

Special attention has been given problems relating to organizing, building, equipping, and operating creameries. While many States were included in this work, special attention and help have been given to creameries in the Southern States, where the comparative newness of the industry made assistance in creamery development of vital importance. As a result of these efforts the manufacturing methods and the sanitation of the plants in many localities are now equal to those of the best dairy sections of the country. Much of this progress is due to improvement in methods of dairy farming and the resulting improvement in the quality of the cream brought to the creameries. In bringing about these results the field agents have worked largely with the farmers of small means who depend on dairying for a livelihood.

The high prices of coal and electric power have given new importance to economy and efficiency in power and refrigeration. A number of creameries were given assistance in building refrigerators, and specifications were furnished for exhaust-steam water heaters, resulting in material savings to the plants concerned. Exhaust-steam water heaters and hot-water boiler-feed pumps were installed by 45 creameries. Equipment for using exhaust steam for pasteurizing cream was installed by 6 creameries, balanced valves were put in 3 plants, and electric motors installed by 3 plants.

THE GROVE CITY CREAMERY.

The addition to the creamery plant at Grove City, Pa., has been completed, and cheese of the Camembert, Roquefort, and Swiss varieties is now being manufactured in an effort to encourage production in the United States of these cheeses, which heretofore have been largely imported.

Despite the high cost of feed and the curtailing of milk production, the Grove City creamery has surpassed the records made in 1918 in practically all lines, and the total business done has increased from \$375,595 in 1918 to \$520,486 in 1919. For the past few months the creamery has received larger premiums in price for its products than ever before.

CHEESE-FACTORY EXTENSION.

Much work has been done by the Dairy Division's field men in determining suitable localities for the manufacture of Cheddar cheese and demonstrating the proper methods of organizing, building, equipping, and operating cheese factories, training cheesemakers, and otherwise giving assistance in both the manufacture of cheese and the production of the milk for its manufacture. Several factories have been established as a result of this work, especially in the mountainous sections of the Southeast. The cheese produced has been generally of good quality and dealers have been eager to buy it at good prices.

INSPECTION OF BUTTER FOR THE NAVY.

The large quantities of butter contracted for by the Navy required extensive supervision by this department in the making of the butter and in investigating the results of various methods of manufacture and determining the effect of storage on the butter. Considerable time was spent in inducing creameries to make butter under Navy contract, also in obtaining inspectors and in making certain that the specifications were properly carried out. Although the packing of the butter was carried out under pressure of war conditions, the quality proved to be high. Seven supervisors and 90 inspectors were engaged in this work, which involved over 9,000,000 pounds of butter produced in 119 creameries. The butter was produced largely in Minnesota, Iowa, and California, with smaller quantities from Wisconsin, Michigan, and Pennsylvania.

When the Government commandeered butter held in storage in the principal markets of the United States, the butter allotted to the Navy was scored by department representatives at the request of the Navy Department.

INSPECTION OF RENOVATED-BUTTER FACTORIES.

The supervision of renovated-butter factories, consisting of an inspection of the sanitary condition of the factories and the approval of wrappers and cartons used, was conducted at 15 plants, whose output for the fiscal year amounted to 16,667,455 pounds. This is a decline of 14 per cent from the preceding year and of 62.75 per cent in 10 years.

MILK INVESTIGATIONS AND DEMONSTRATIONS.

SANITARY SURVEYS OF CITY MILK SUPPLIES.

Surveys on the sanitation of the milk supplies of several cities were made. These surveys were more detailed than in former years and took into consideration the source and handling of the milk supply, together with laboratory and inspection methods used in safeguarding its quality. Detailed bacteriological tests were made in many instances, and considerable help was given to the city authorities in the preparation of new milk ordinances. In the course of this work 478 dairy farms and 415 city milk plants were inspected, 3,532 bacterial counts were conducted, and 95 chemical tests were made.

SANITARY SURVEYS OF MILK SUPPLIES FOR ARMY AND NAVY.

Sanitary inspection work for safeguarding the milk supplies of Army cantonments and naval bases and hospitals was continued and extended at the request of the United States Public Health Service. Careful and thorough investigations of the source and handling of milk were made, and raw milk, sour milk, and repasteurized milk were excluded. This work was done in 9 cantonment zones, with specially complete surveys at Houston, Waco, and San Antonio, Tex., and Lawton, Okla.

MILK CONTESTS.

Each year the milk contest is proving itself more valuable as a means of improving the city milk supply and keeping the quality at a high standard. During the year five contests were held in five States and a total of 264 samples of milk and cream were given a complete score. Criticisms and suggestions for improvement were made to exhibitors.

MILK-PLANT MANAGEMENT.

The work in milk-plant management consisted largely of personal assistance in the operation of milk plants and help in the organizing of central plants. Assistance of various kinds was also given by correspondence, including the drawing of numerous special floor plans and making estimates of cost for proposed plants, collecting data relative to cost and method of operation, and giving special aid in the selection of equipment. The field work has been largely the gathering of data and assisting new plants in planning construction and equipment. At Atlanta, Ga., for example, the Dairy Division representative worked in cooperation with the health department in familiarizing the dealers with the new pasteurizing equipment required and helping the foremen to systematize the work, and in Minnesota, at the request of the State board of health, milk plants were studied and recommendations were made for the improvement of pasteurizing methods and equipment. Work of this nature was carried on in a large number of cities in 14 States.

MILK IMPROVEMENT AT GROVE CITY, PA.

Through experiments at the Grove City creamery an effort was made to work out some plans for improving the quality of the market milk and to procure better milk for cheesemaking. As a result the average of the bacterial counts in the milk during the summer of 1919 was even lower than the preceding winter's average. Probably the most important step taken in connection with sanitation was the adoption of the grading system of milk, by which milk sent in by the patrons is graded for bacteria, temperature, farm conditions, and sediment. The premiums paid on milk which received a high score have done much to improve the quality of the milk delivered by the patrons of the creamery.

METHOD OF CLEANING MILKING MACHINES.

The increase in the use of milking machines has made it desirable to devise some method of cleaning and sterilizing that will prevent excessive numbers of bacteria. After a study of the construction of various machines and methods of cleaning and sterilizing them under

farm conditions, a system of cleaning has been devised which has given good results in lowering bacterial counts and checking the spread of garget, but further work is required on the problem.

REQUIREMENTS FOR MILK PRODUCTION.

Studies of the various requirements for milk production have reached a stage where some definite information is now available. A two-year study on a group of dairy farms near Vergennes, Vt., has been completed and tabulations have been made on the requirements and cost of producing 100 pounds of milk and the requirements for keeping a cow for one year. Similar data have been obtained from two-year studies in Indiana and North Carolina. Experiments of a like nature have been in progress for one year on a group of dairy farms near Omaha, Nebr.; Amite, La.; and Mount Vernon, Wash., and more recently another has been begun at Middletown, Del.

DAIRY RESEARCH LABORATORIES.

BACTERIOLOGY.

The Dairy Division laboratories, in addition to research pertaining strictly to the dairy industry, have continued to carry on work of a broader character with a view to contributing to the knowledge and practical application in general. Some work of the latter nature too technical to be described in this report is in course of publication.

A study of streptococci from sour milk, feces, and the udder has resulted in the working out of methods for separating and distinguishing these organisms, and has shown the existence of a typical lactic streptococcus. Media which promise to be of considerable value in bacteriological technique have been developed by the substitution of yeast extract for the usual beef extract. Progress has also been made in developing a test for quality of milk through work with sporogenes.

MILK SECRETION.

Further studies on milk secretion have demonstrated that there is a close relation of the phosphorus and calcium content of the blood to the milk-producing function. It has been shown that a deficiency of phosphorus in the rations for cows and calves has a detrimental effect on milk secretion and growth. A remedy for this condition was found in the addition of sodium phosphate to rations deficient in phosphorus. Work with dairy cows has shown that the feeding of phosphorus and calcium results in a decided beneficial effect on the milk flow, in both amount and fat content. Balance experiments have shown also that the conditions under which it is necessary to keep cows while conducting work of this kind have a disturbing effect on the digestive processes. This observation calls for improvements in equipment used in the future.

CONDENSED AND EVAPORATED MILK.

Investigations have been undertaken with various forms of condensed and evaporated milk, with the general purpose of improving the physical condition and keeping qualities of these products.

Studies on the curdling of evaporated milk in sterilizing have been continued, and progress has been made on the problem of preventing the thickening of sweetened condensed milk on standing.

The theoretical sugar solution required to inhibit bacterial growth in the condensed milk has been determined within narrow limits. A study of the bacteria and yeast which might be involved in these changes has resulted in increased knowledge of their behavior.

Work with certain molds has positively demonstrated that the "buttons" of condensed milk are caused by this growth. Further results have shown that in commercial production the condensed milk may be produced without danger from molds if sealed under the vacuum produced by the ordinary vacuum pump.

Tests to determine the suitability of milk for condensing purposes indicated that neither the acid test alone nor the alcohol test alone nor a combination of the two was satisfactory.

ICE CREAM.

A substitute for a large part of the cane sugar in ice-cream making was found through experiment, and the formula was widely disseminated. The preparation of pure butterfat for ice cream and reconstituted milk has not given satisfactory results.

CHEESE.

A special effort has been made to apply the new methods of making the Swiss type of cheese on a commercial basis. In most of the factory trials this method was a success and resulted in the production of cheese of uniformly high quality. Before extensive work can be done with factories, however, a practicable means of distributing eye-forming cultures must be devised. The question of the relation of the culture and formation of eyes has been established beyond question.

In an attempt to introduce into this country the manufacture of various cheeses now imported, cheeses of the Camembert and Roquefort varieties were made successfully on a commercial scale at the Grove City creamery, but so far none have had a fair trial on the market.

UTILIZATION OF CREAMERY BY-PRODUCTS.

Considerable work has been done on the development of casein for use in waterproof glue, and a casein of low ash and acid has already been produced.

A method of producing casein from buttermilk is also being worked out. Using a solvent to extract the fat from the buttermilk, small lots of casein have been made, and this product was found to be of general good quality and low in fat and ash, but had the objection of dissolving slowly.

Work is now in progress with the object of developing a method of utilizing whey as a human food. It is probable that whey represents a greater actual loss of food than skim milk, because its feeding value is not generally recognized. Primost and Ricotta cheeses, which are made from whey, were produced at the Grove City creamery, but the demand has been limited. The use of these cheeses might be extended if their value for cooking could be brought to the attention of housekeepers. Investigations have also been begun on the utilization of whey solids in the form of poultry feed.

SILAGE INVESTIGATIONS.

Studies on the value and composition of corn plants and sunflower plants for silage have shown that good silage can be made from the latter as well as the former. Various tests have been made on the composition of these crops at different stages of maturity, but no correlation has been established between the composition of the plants and the quality of the silage.

WAR ACTIVITIES.

A considerable part of the time of the laboratory staff was spent in lending aid in preparing material necessary to carry on the war. Assistance was rendered to the Army Medical Corps by providing laboratory facilities for drying typhoid vaccine. Probably the most important work, however, was the developing on short notice of a method of making casein of more than ordinary purity. This was necessary in the manufacture of the waterproof glue essential to the manufacture of airplane parts. Another war problem worked out was the purification of oil-soaked cotton waste. This work was in progress and the process nearly perfected when the signing of the armistice made it advisable to discontinue the work.

DAIRY STATISTICS.

Considerable attention has been given to the gathering, compiling, and charting of statistical dairy information to meet the usual general demand as well as special requests from various war boards for such data. A circular on the trend of the dairy-cattle industry was published and material relating to the trend of the butter and cheese industries has been prepared for publication.

DAIRY ENGINEERING.

The Dairy Division has continued to deal with various engineering problems relating to dairying. Subjects given attention were the preparation of plans and specifications for buildings and machinery, the superintendence of construction, the inspection of materials and equipment and the designing and construction of apparatus, including work for the bureau and other institutions and for the dairy industry. Information has been furnished regarding dairy buildings and other problems in dairy engineering in reply to inquiries on these subjects, and 362 blueprints of various dairy buildings have been prepared for field men. Several new plans for dairy buildings were designed, including a creamery, a cheese factory, and a cow stable. A bulletin on the economical use of fuel was written and published.

DAIRY-CATTLE BREEDING.

A start has been made in the extensive dairy-cattle breeding experiments that were outlined in last year's report. The work deals with line breeding, inbreeding, and crossbreeding, the fundamental object being to determine the best method of developing the better-producing cows in large numbers. For work in line breeding as compared with the mating of unrelated animals a herd of 35 registered Holstein-Friesian cows has been established at the Beltsville farm,

and the producing ability of the cows is now being tested. Other breeding projects are to be carried out cooperatively with various experiment stations.

A study of the unusually prepotent breeding animals of the Holstein-Friesian breed is almost completed. In the study of 126 sires which have daughters with yearly records that conform to certain arbitrary standards, which were established for this work, it was found that all but 14 of them traced back to five sires.

MEAT INSPECTION DIVISION.

The Federal meat inspection, conducted by the Meat Inspection Division, with Dr. R. P. Steddom as chief, reached the largest proportions in its history. The number of animals slaughtered was 20.6 per cent greater than in the preceding fiscal year and 21.6 per cent greater than the average for the last 12 years during which the present meat-inspection law has been operative.

INSPECTION OF DOMESTIC MEATS.

Inspection was conducted at 895 establishments in 263 cities and towns, as compared with 884 establishments in 263 cities and towns during the fiscal year 1918.

Inspection was begun at 84 establishments and withdrawn from 73 during the year, as compared with 83 and 74, respectively, during 1918. Inspection was withdrawn from 66 establishments on account of discontinuance of slaughtering or of interstate business, from 2 for violations of the regulations, from 4 by request, and from 1 because of consolidation with another establishment under inspection.

ANTE-MORTEM AND POST-MORTEM INSPECTIONS.

The ante-mortem and post-mortem inspections are given in the following tables:

Ante-mortem inspection of animals.

Class of animals.	Passed.	Suspected. ¹	Condemned. ²	Total inspected.
Cattle.....	11,211,937	96,077	87	11,308,101
Calves.....	3,658,495	5,348	18	3,663,861
Sheep.....	11,277,597	6,240	14	11,283,851
Goats.....	125,640	27		125,667
Swine.....	41,322,940	106,977	2,469	44,432,386
Total.....	70,596,609	214,669	2,588	70,813,866

¹ This term is used to designate animals found or suspected of being unfit for food on ante-mortem inspection, most of which are afterwards slaughtered under special supervision, the final disposal being determined on post-mortem inspection.

² For additional condemnations see succeeding tables.

Post-mortem inspection of animals.

Class of animals.	Passed.	Condemned.	Total inspected.
Cattle.....	11,182,442	59,549	11,241,991
Calves.....	3,665,025	9,202	3,674,227
Sheep.....	11,253,999	14,371	11,268,370
Goats.....	125,342	318	125,660
Swine.....	44,269,584	128,805	44,398,389
Total.....	70,496,392	212,245	70,708,637

The next two tables show the diseases and conditions for which condemnations were made.

Diseases and conditions for which condemnations were made on ante-mortem inspection.

Cause of condemnation.	Cattle.	Calves.	Sheep.	Goats.	Swine.
Arthritis.....					2
Ascites.....					1

Total.....	59,547	166,791	9,202	2,479	14,371	330	318	17	128,805	433,433

The following table shows the total condemnations on ante-mortem and post-mortem inspections combined:

Summary of condemnations.

Class of animals.	Animals or carcasses.	Parts.
Cattle.....	59,636	166,791
Calves.....	9,220	2,479
Sheep.....	14,385	330
Goats.....	318	17
Swine.....	131,274	433,433
Total.....	214,833	603,050

In addition to the foregoing, the carcasses of 89,873 animals found dead or in a dying condition were tanked, as follows: Cattle, 5,237; calves, 4,784; sheep, 8,813; goats, 161; swine, 70,878.

INSPECTION OF MEAT AND PRODUCTS.

The inspection and supervision of meats and products prepared and processed are shown in the following table, which is a record only of supervisory work performed and not a statement of the aggregate quantity of products prepared. The same product is sometimes duplicated by being reported in different stages of preparation under more than one heading.

Meat and meat food products prepared and processed under inspection.

Kind of product.	Pounds.	Kind of product.	Pounds.
Placed in cure:		Meat extract.....	3,460,874
Beef.....	327,360,122	Lard.....	1,256,042,851
Pork.....	3,717,838,052	Lard oil.....	618,123
All other.....	2,588,734	Lard stearin.....	514,218
Sausage, chopped.....	667,602,113	Compound and other substitutes.....	469,731,660
Canned product:		Pork to be eaten uncooked.....	42,165,696
Beef.....	483,972,721	Oleo stock and edible tallow.....	58,768,630
Pork.....	143,345,433	Oleo oil.....	138,700,323
All other.....	4,940,949	Oleostearin.....	69,339,566
Sterilized product:		Oleomargarin.....	251,169,778
Beef.....	4,045,975	Miscellaneous products.....	1,516,694,904
Pork.....	10,132,470		
All other.....	8,857	Total.....	9,169,042,049

The following quantities of meat and meat food products were condemned on reinspection on account of having become sour, tainted, putrid, unclean, rancid, or otherwise unwholesome: Beef, 15,898,479 pounds; pork 14,113,246 pounds; mutton, 152,981 pounds; veal, 116,016 pounds; goat meat, 42,598 pounds; total, 30,323,220 pounds.

MARKET INSPECTION.

Market inspection was begun during the fiscal year at two cities, making a total of 45 cities at which this inspection is maintained in order that interstate deliveries of meats and products may be made therefrom.

MEAT AND PRODUCTS CERTIFIED FOR EXPORT.

The following products were certified for export: Beef and beef products, 714,706,213 pounds; mutton and mutton products, 3,297,395

pounds; pork and pork products, 2,774,067,187 pounds, a total of 3,492,070,795 pounds. In addition 536 certificates were issued covering the export of 15,071,507 pounds of inedible animal products.

EXEMPTION FROM INSPECTION.

The provisions of the meat-inspection law requiring inspection usually do not apply to animals slaughtered by a farmer on a farm nor to retail butchers and dealers supplying their customers. The retail butchers and dealers, however, in order to ship meat and meat food products in interstate or foreign commerce, are required first to obtain certificates of exemption. The number of exemption certificates outstanding at the close of the fiscal year was 2,551, an increase of 43 over the preceding year. During the year 103 certificates were canceled, 99 on account of the dealers retiring from business or ceasing to make shipments, and 4 for violations of the regulations. During the year 31,470 shipments were made by retail dealers and butchers holding certificates of exemption, as compared with 45,524 shipments during the fiscal year 1918. The shipments of the year covered products as shown in the following table:

Shipments by retail dealers and butchers under certificates of exemption from inspection.

Product.	Number.	Pounds.	Product.	Number.	Pounds.
Beef, carcasses (729 quarters)	182	75,232	Cured meats.....		190,525
Veal, carcasses.....	22,354	2,005,827	Lard.....		10,655
Sheep, carcasses.....	176	9,185	Sausage.....		50,603
Swine, carcasses.....	399	53,654	Miscellaneous (scrapple, tripe, headcheese, etc.).....		22,283
Beef, fresh.....		538,288			
Veal, fresh.....		155,219	Total.....	23,111	3,346,214
Mutton, fresh.....		110,176			
Pork, fresh.....		124,567			

During the year 60,197 interstate shipments were made of meats and meat food products from animals slaughtered by farmers on the farm, as compared with 73,746 shipments made during the fiscal year 1918. The following table shows the products covered by these shipments:

Shipments of farm-slaughtered products under exemption from inspection.

Product.	Number.	Pounds.	Product.	Number.	Pounds.
Beef, carcasses (2,662 quarters).....	665	259,985	Pork, fresh.....		161,910
Calves, carcasses.....	82,881	7,382,960	Cured meats.....		648,713
Sheep, carcasses.....	2,809	89,157	Lard.....		151,248
Swine, carcasses.....	8,716	1,140,824	Sausage.....		118,049
Beef, fresh.....		39,052	Miscellaneous (scrapple, tripe, headcheese, etc.).....		20,500
Veal, fresh.....		49,014			
Mutton, fresh.....		4,643	Total.....	95,071	10,066,055

INSPECTION OF IMPORTED MEATS.

The following table shows the inspection of imported meats and meat food products for the fiscal year, representing an increase of 204.8 per cent over the inspections for the preceding year.

Imported meat and meat food products inspected.

Country of origin.	Fresh and refrigerated meats.		Cured and canned meats.	Other products.	Total weight.
	Beef.	Other classes.			
Argentina.....	451,456	38,781	79,278,623	114,029	79,882,889
Australia.....		33,415	40,185	1,015,940	1,089,540

The following statement shows the condemnations of imported meats and the amounts refused entry on account of lack of foreign certificates or other failure to comply with the regulations.

Import meat products condemned or refused entry.

Product.	Con-demned.	Refused entry.
Beef.....	329,270	466,400
Veal.....	200	
Mutton.....	36	
Pork.....	10,852	35,396
Total.....	340,358	501,802

INSPECTION FOR OTHER DEPARTMENTS OF THE GOVERNMENT.

By request of the Navy, War, and Interior Departments reinspections of meats and meat food products to determine whether they were wholesome and conformed to the specifications were made during the fiscal year. Inspections were made at 50 places for the Navy Department and 68 for the War Department. The following table shows the amounts of such inspections.

Inspection for other branches of the Government.

Department.	Inspected.	Rejected.
	<i>Pounds.</i>	<i>Pounds.</i>
Navy Department.....	173,463,509	5,200,846
War Department.....	114,273,114	4,791,392
Interior Department (Indian Affairs).....	497,228	4,300
Marine Corps.....	9,931	
Panama Railroad.....	4,784	
Total.....	288,248,566	9,996,538

LABELING OF MEAT AND PRODUCTS.

The law provides for the approval of labels and other markings previous to their use on meat and meat food products, and prohibits the application of false or deceptive names. The regulations made under these provisions of law require that sketches of new trade labels and other markings be submitted for official approval, to be

followed by the submission of the finished labels and markings for final approval. There were submitted during the year enormous quantities of materials, including labels, cartons, stencils, box dies, brands, and tags, as well as inserts placed inside of meat containers, and advertising matter bearing copies or reproductions of the Federal meat-inspection legend. Large numbers of these were found to contain false and misleading statements concerning the character or composition of the product represented and were disapproved.

NET WEIGHT AND VOLUME LAW.

The net weight and volume amendment to the food and drugs act, being applicable to meat and meat food products, is administered by the Meat Inspection Division in establishments under the Federal meat inspection. Numerous questions arose concerning the proper method of computing the weight of canned products and tolerances and variations from the declared quantity of contents which might be considered reasonable within the meaning of the statute. The question of liquids surrounding the meat and products in cans was also given attention, resulting in the correction of the practice of including the weight of added water in the statement of quantity on containers. In the case of canned products packed for commercial use and found to bear incorrect statements of weight relabeling was required. Errors of this nature occurring on products prepared for the Army were called to the attention of the War Department and resulted either in the correction of the statements of weight or in the rejection of the products.

In cooperation with the War Industries Board and the Committee on the Conservation of Tin Plate of the Federal Food Administration the slack filling of tin containers of meat or meat food products at establishments under inspection was prohibited during the period of the war.

MEAT-INSPECTION LABORATORIES.

The laboratory examination of samples of meat and meat food products prepared at establishments at which inspection is conducted has been continued in the meat-inspection laboratories maintained in Washington and six other cities of the country. This examination consists in determining whether the product is properly labeled or contains any deleterious substance, in analyzing spices, waters, and other ingredients used in the curing and preparation of meat food products, and in analyzing rat exterminators, inks, etc.

The laboratories also continued to examine meat and products prepared for the Army and the Navy to determine whether they contained any harmful substance and to see that they conformed to the Army and Navy specifications.

The total number of products analyzed during the year was 60,040, of which 51,737 were domestic, 992 imported, and 7,311 specially prepared for military consumption. Samples of 1,491 domestic and 38 imported products were found to be not in accordance with the regulations and 21 of those examined for the Army and the Navy were rejected. Of 686 waters examined 111 were prohibited for use in their untreated state where they would come in direct contact with meats.

Four hundred and fifty gallons of branding ink was prepared and sent to meat-inspection stations for use in marking meats.

In addition to the routine work of a regulatory nature, the Washington meat-inspection laboratory has cooperated with the Office of Home Economics of the States Relations Service in studying the composition of undigested fats. Studies have been made also of fats which had been heated to the smoking temperature, the tests showing that such fats undergo a slight decomposition. The Washington laboratory developed a method for the detection of whale meat in sausage or other mixtures with animal fats. In cooperation with the Bureau of Markets, the Washington and St. Louis laboratories have made studies of the melting point and composition of the fat of soft pork. All creameries which prepare butter to be used in oleomargarin were inspected, and lists were issued showing those which met the requirements relative to pasteurization.

QUARANTINE DIVISION.

The work of the Quarantine Division, under Dr. R. W. Hickman, chief, has consisted, as heretofore, in the inspection and quarantine of imported live stock, the inspection of animals for export, the tuberculin testing of import and export dairy and breeding cattle, the inspection, disinfection, and fitting of ocean steamers which carry live stock, and the administration of regulations governing the importation of hides, hair, wool, hay, straw, etc.

INSPECTION AND QUARANTINE OF IMPORTED ANIMALS.

Imports of live stock were seriously interfered with by the great difficulty in procuring steamer space and sailings during the first half of the fiscal year and also by the appearance of foot-and-mouth disease in England. Outbreaks of that disease in Sussex in September and in Yorkshire in January necessitated the closing of United States ports to European shipments until late in April. With the improvement of shipping conditions and the reopening of our ports to British shipments, American purchasers in England promptly made use of the opportunity for which they had been waiting, and live-stock importations for May and June indicated a return to the normal volume.

The following tables show the importations of the various kinds of live stock through the different ports of entry:

Imported animals inspected and quarantined.

Port of entry.	Cattle.	Sheep.	Swine.	Other animals.
New York.....	585	295	9	156
Boston.....	110			
San Francisco.....		128		94
Canadian border ports.....	1,878	618	152	44
Total.....	2,573	1,041	161	294

Imported animals inspected but not quarantined.

Port of entry.	Cattle.	Sheep.	Swine.	Goats.	Horses.	Other animals.
New York.....					74	
Baltimore.....					110	
Boston.....	110				1	
New Orleans.....					22	
Philadelphia.....						1
San Francisco.....						471
Key West.....				2	331	
San Juan.....	357					
Newport News.....					6	8
Mexican border ports.....	88,778	63,973	273	24,725	5,509	1
Canadian border ports.....	356,549	117,973	24,102	14	8,753	99
Total.....	445,794	181,946	24,375	24,741	14,866	580

Inspectors of the bureau also inspected and held in quarantine for the Bureau of Biological Survey 4,358 live quail imported from Mexico for breeding purposes.

The 357 cattle shown in the second table as entered at San Juan, Porto Rico, were shipped from the Virgin Islands and were not subject to the United States quarantine laws.

The animal quarantine station for the port of Baltimore, having been turned over to the War Department early in the preceding year for the storage of munitions and not yet relinquished, was unavailable for quarantine purposes throughout the entire year; hence all importations of animals subject to quarantine and coming to the Atlantic seaboard were entered at New York or Boston.

Through the courtesy of the British Government the bureau has continued to maintain an inspector in Great Britain, among whose duties is the tuberculin testing of cattle intended for shipment to the United States. During the year 786 cattle were so tested in the United Kingdom and the Channel Islands at the request of importers. This work is shown in the following table:

Results of tuberculin tests of cattle for importation into the United States.

Breed.	Tested.	Passed.	Rejected.
Ayrshire.....	2	2	
Guernsey.....	567	562	5
Hereford.....	2	1	1
Holstein.....	1	1	
Jersey.....	123	120	3
Shorthorn.....	91	84	7
Total.....	786	770	16

Cattle not accompanied by satisfactory certificates of tuberculin test signed or approved by the bureau inspector in Great Britain must be tested in quarantine after arrival in the United States. Ninety-nine cattle were thus tested and all were passed.

IMPORTATIONS OF ANIMAL BY-PRODUCTS.

The bureau, through the Quarantine Division, has continued its cooperation with the Treasury Department in the administration of the regulations governing the sanitary handling and control of hides,

skins, and other animal by-products offered for entry into the United States. This bureau endeavors to protect the domestic live stock from possible infection of anthrax, foot-and-mouth disease, and rinderpest, which diseases exist in many parts of the world from which animal by-products are imported. These regulations provide that hides and skins from countries where anthrax is prevalent, or in which foot-and-mouth disease or rinderpest exists, shall be disinfected prior to shipment, or, at the discretion of the shipper, any such hides and skins may be forwarded to the United States, subject to disinfection at a tannery at destination under bureau supervision. The greater part of the imported hides and skins are so certified as to render them eligible for importation without disinfection.

INSPECTION OF ANIMALS FOR EXPORT.

The exportation of live stock is subject to regulations providing for inspection to assure that the animals are in good health and for their humane handling and safe transport. All live stock offered for export is inspected and in certain cases certificates are issued. Cattle for dairy and breeding purposes are subjected to the tuberculin test. Statistics of the inspection of animals for export are given in the following table:

Inspection of animals for export.

Kind of animals.	With certificate.		Without certificate.		Total.
	American animals.	Canadian animals. ¹	To Canada.	To other countries.	
Cattle.....	1,361	1	8,735	818	10,915
Sheep.....	8		5,155		5,163
Goats.....	9		18		27
Swine.....	696		98	602	1,396
Horses.....	² 9,775		5,441	234	15,450
Mules.....	³ 8,150		193	3	8,346
Total.....	19,999	1	19,640	1,657	41,297

¹ In former years considerable numbers of Canadian animals were exported through the United States. Although only one animal was so exported during the past fiscal year, this column is kept separate for comparison with previous statistics.

² Including 9,615 horses to Europe for military purposes.

³ Including 7,411 mules to Europe for military purposes.

Of the cattle inspected for shipment to Canada, 1,321 were dairy and breeding stock and were tested with tuberculin; 85 reacted and were rejected. The remaining 7,414 cattle for Canada were range animals and were not tested. The 818 cattle for other countries were tested with tuberculin; 10 reacted and were rejected. The mallein test was applied to the 5,441 horses and 193 mules for Canada and 234 horses and 3 mules for other countries, with only 2 reactors.

In carrying out the regulations governing the overseas transportation of live stock 215 inspections of vessels were made before clearance.

DAIRY AND BREEDING CATTE FOR BELGIUM AND FRANCE.

Since the close of the war an entirely new line of business is in course of development in connection with the exportation of live stock, namely, the shipment of dairy and breeding cattle to France

and Belgium. Three small shipments had gone forward at the close of the year, one to France and two to Belgium, the former consisting of 135 head and the latter of 180 and 350, respectively.

FIELD INSPECTION DIVISION.

The Field Inspection Division, under Dr. A. W. Miller, chief, has continued its activities for the control and eradication of certain diseases of live stock and has also conducted work in the enforcement of certain live-stock quarantine and transportation laws.

ERADICATION OF SCABIES.

In the work of eradicating sheep scabies in cooperation with State officials bureau employees in the field made 22,394,561 inspections and supervised 10,518,196 dippings, constituting increases over the year before of 14 and 88.3 per cent, respectively. The bureau also assisted State authorities in arresting outbreaks of sheep scabies in Michigan and Iowa. In Michigan the eradication has been practically completed, while in Iowa, where the infection was widely scattered through the introduction of feeder sheep, progress is being made toward its elimination. No cases of the disease are now known to exist in Montana or North Dakota, and in Idaho the considerable spread of the infection following the outbreak of the previous year has been brought under control and the work of eradication in affected areas is progressing. The island of San Clemente, Calif., was quarantined on account of the prevalence of sheep scabies.

In the course of the cooperative eradication of cattle scabies bureau employees made 1,707,917 inspections and supervised 935,539 dippings of cattle in the field, the dippings marking an increase of 46 per cent over the figures for the preceding year. An extensive spread of the infection in western Kansas is being brought under control, and in the new areas of infection in southwestern New Mexico effective work is being done by bureau and State employees. In northwestern Texas and in Montana the disease was found to exist to a considerably greater extent than for several years.

Bureau employees also assisted State authorities in Colorado, Nebraska, and Vermont in efforts to eradicate sarcoptic mange in numerous herds of cattle in those States.

Horses and mules to the number of 414 were inspected for scabies and 74 were dipped under bureau supervision.

ERADICATION OF DOURINE.

Intensive efforts to control and eradicate dourine of horses were continued and satisfactory progress was made. In the Middle and Northwestern States, where the disease has prevailed, the extent of the infection was found to be considerably less than in former years. No cases are known to exist in Iowa or Nebraska, and the infection exists only to a slight extent in North Dakota and Wyoming. In South Dakota a large number of animals were tested and less than 1 per cent found to be affected. In Arizona and New Mexico, however, especially in the former, further investigations and the testing of large numbers of horses revealed the widespread existence of the disease. As the affected areas are largely within the various Indian reservations, and the horses, which are owned principally by the Indians

living under a tribal form of government, are wild ponies ranging in rough and inaccessible regions, eradication work is carried on under great difficulties. However, officials of the States concerned and of the Indian Service of the Department of the Interior, as well as horsemen in the affected areas, have cooperated with the bureau in a satisfactory manner and considerable progress has been made. The bureau continued the practice of paying one-half of the appraised valuation of infected horses destroyed when they were owned by citizens, such share not to exceed \$100 in any one case. The number of animals tested and the results of the tests are reported by the Pathological Division.

INSPECTION OF ANIMALS FOR INDIAN AGENCIES.

In cooperation with the Office of Indian Affairs, 53 head of horses and mules and 40 head of cattle were inspected for allotment to Indian agencies. Twenty of the horses and mules were rejected, the remainder of the animals being passed for allotment.

CONTROL OF INFLUENZA, ANTHRAX, AND OTHER DISEASES.

In continuation of the war emergency campaign to stimulate the production and conservation of live stock, work was carried on looking to the control of anthrax, influenza, and other diseases and to a reduction of the losses resulting therefrom.

The assignment of 30 bureau employees to service with the War Department to assist in the efforts being made to reduce losses among Army horses and mules from influenza was continued until about February 1. The activities of these employees were directed toward bettering sanitary conditions at all points where public animals were handled, and great improvement was made, with the result that such losses were very materially reduced.

At the large markets of the country bureau employees were regularly assigned to work for the control of influenza, inspecting all horses and mules received and isolating sick animals. At those stations 507,559 such animals were inspected, of which 5,341 were sent to the hospital. Of the latter number 622 died of influenza, which showed a great reduction below the average losses of previous years. In addition to the regular assignments, cooperation was extended to State officials and horsemen at practically all bureau stations.

Cooperation was extended to the officials of various States, especially those along the Gulf coast, in the control of anthrax and the reduction of losses from that disease. Bureau employees supervised the disinfection of infected premises and the proper disposal of carcasses of animals dead from anthrax, and whenever necessary assisted the owners of infected herds in the vaccination of susceptible animals. In southern Texas alone, where the disease has existed extensively in recent years, bureau employees assisted in the vaccination of about 30,000 animals. Good results were obtained and the value of prompt and vigorous control measures was fully demonstrated.

On the request of stockmen or other interested persons, bureau employees were detailed to investigate outbreaks of blackleg, to advise owners as to the proper treatment, and, if necessary, to assist in vaccination.

Investigations of reported outbreaks of disease among domestic animals were made in various parts of the country. In cooperation with the State officials of South Dakota the bureau assisted in successfully arresting a serious outbreak of cerebrospinal meningitis among horses. Cooperation was also extended to the National Park service in determining the cause of the death of a number of buffaloes in Yellowstone Park.

To guard against the recurrence of foot-and-mouth disease, careful inspections of all ruminants and swine received at public stockyards were made by experienced veterinarians specially assigned to that work as in previous years. Prompt investigations were made of all suspected outbreaks of the disease reported to the bureau, with negative results in all instances.

LIVE-STOCK SANITARY WORK IN INTERSTATE COMMERCE.

In the course of supervising the interstate transportation of live stock to prevent the spread of animal diseases, bureau employees at market centers inspected 22,594,329 cattle, of which 10,897 were dipped under bureau supervision in order that they might continue in interstate commerce. Sheep to the number of 20,597,232 were also inspected for communicable diseases, and of these 884,294 were dipped under bureau supervision to comply with the regulations of the department or of the States of destination.

An outstanding feature of this work during the year was the great increase in the number of swine immunized against hog cholera in order that they might be distributed from public stockyards for purposes other than slaughter. The number so immunized after careful inspection was 614,673, an increase of 140 per cent over the preceding year.

Upon request of transportation companies and shippers or to comply with laws of States to which shipments were destined, bureau veterinarians inspected 17,346 horses and mules, of which 5,854 were tested with mallein, 9 showing reactions.

During the year 24,655 cars carrying animals affected with communicable diseases were received at bureau stations. In compliance with department regulations or on request of Canadian Government officials, State officials, or transportation companies, 44,843 cars were cleaned and disinfected under bureau supervision.

VIOLATIONS OF LIVE-STOCK TRANSPORTATION AND QUARANTINE LAWS.

The bureau has continued to report to the Solicitor of the department, for presentation to the proper officials of other departments, cases of apparent violations of live-stock transportation and quarantine laws. Many of these cases have required special investigation on the part of bureau employees, such as interviewing witnesses and examining railroad and other records. Five bureau employees were regularly assigned to this work, though the greater part of the work of collecting evidence and preparing and submitting reports is done by bureau employees at stockyard centers, in connection with their other duties. The enforcement of the so-called 28-hour law has resulted in better facilities being provided for the feeding, watering, and handling of live stock in transit.

TICK ERADICATION DIVISION.

The work for the suppression of Texas or tick fever of cattle and the extermination of the ticks which transmit it has again shown greater progress than in any previous year. This work is conducted through the Tick Eradication Division, of which Dr. R. A. Ramsay is chief, in cooperation with the authorities of the Southern States affected.

PROGRESS IN TICK ERADICATION.

Areas aggregating 79,217 square miles, having been freed of ticks, were released from quarantine during the fiscal year. This action makes available 93 counties and 33 parts of counties into which better-bred cattle from tick-free States may be safely introduced, with consequent increase in beef and in dairy products. The total area released since the beginning of this work in 1906 amounts to 458,529 square miles, which is nearly 63 per cent of the originally infected area. The work is also far advanced in a large additional territory. The following table shows the territory released during the past fiscal year:

Areas released from quarantine as a result of eradicating cattle ticks, fiscal year 1919.

State.	Square miles.	State.	Square miles.
Alabama.....	2,102	North Carolina.....	1,983
Arkansas.....	2,184	Oklahoma.....	8,749
Florida.....	4,745	South-Carolina.....	8,619
Georgia.....	7,618	Texas.....	19,725
Louisiana.....	23,492	Total.....	79,217

During the year 47,843,791 inspections or dippings were made of cattle for the eradication of ticks as against 34,927,959 in the preceding year. There were in operation 33,789 cattle dipping vats where cattle were dipped under Federal or State supervision to rid them of ticks.

A great deal of advance work pertaining to the construction of dipping vats and preparing counties and localities for regulatory tick-eradication activities in the near future was conducted with a view to proper organization for taking up and carrying on the work in new areas. Effectual cooperation has come from many sources and interests.

Until 1916 what is known as the local-option system was followed in nearly all States cooperating in tick eradication. Under this plan the systematic dipping of cattle every 14 days (which is necessary for the extermination of the parasite) could not be begun in a county until after an election had been called and held and a majority of the voters in the county had expressed themselves in favor of driving out the ticks. This plan was found to work well up to a certain point. That point was when the remaining counties would not vote for tick eradication and became a menace to the tick-free counties which were being stocked with purebred cattle not immune to tick fever. Mississippi affords an example of how this

condition was overcome. When 31 counties stood as an obstacle to further progress the farmers and live-stock men of the tick-free areas induced the legislature to enact a State-wide law requiring county officers within a certain time to provide dipping vats, dipping material, and men to supervise the dipping of all cattle every 14 days from April to November, inclusive, in 1917. The result was that the entire State was released from quarantine on December 1 of that year.

Observing the good results in Mississippi, Louisiana enacted similar legislation, which became effective April 1, 1918. Little opposition was met and such good work was accomplished that on December 1 of the same year 29 counties and parts of several other counties, in all an area of 23,492 square miles, were released from quarantine, and the work is so far advanced in all remaining quarantined areas that their early release seems assured.

Texas also has enacted a State-wide law, but because of the size of the State and the large tick-infested area a different plan has been adopted. The law divides the State into three zones and became effective January 1, 1919, in zone 1, which includes about 65 counties in the northeastern part of the State.

In Alabama there remained 24 counties which during the past two or three years on one or more occasions had refused to vote for tick eradication. The legislature enacted a State-wide law for compulsory dipping, effective March 7, 1919. The regular dipping of cattle was taken up in all the counties, and the State is approaching complete release.

The Georgia legislature enacted a State-wide law to become effective in December, 1919, and arrangements are now being made to enforce it.

Experience has proved that the principle of county or local option on the question of tick eradication is a good way of beginning the work in a State, but that eradication can be more quickly completed by the application of a State-wide law requiring all the tardy counties to take action at the same time in order that the ticks may not be permitted to remain in a few counties or localities and endanger the cattle industry in the areas already freed.

SHIPMENTS FROM QUARANTINED AREAS.

The number of cattle of the quarantined area shipped to market centers for immediate slaughter was 4,807,865, which is a considerable increase over the preceding year and was brought about by local conditions such as drought, which required the immediate marketing of many cattle. Moreover, many cattle owners in tick-eradication localities have shown a disposition to ship for slaughter as many unprofitable cattle as possible in preference to dipping them. This was done with a view of producing, after ticks were eradicated, better-bred animals likely to be more profitable for breeding purposes. "Dipped ticky cattle" to the number of 8,361 were shipped to points where inspection is provided and dipping facilities maintained, for further treatment for movement as noninfectious. At public stockyards 85,087 cattle were dipped and certified for movement as non-infected. For these shipments 1,673 certificates were issued.

At points other than public stockyards 89,616 cattle were inspected or dipped and certified for interstate movement as noninfected, as provided for in the regulations. To cover the shipments of these cattle 979 certificates were issued.

TUBERCULOSIS ERADICATION DIVISION.

The work of the Tuberculosis Eradication Division, in charge of Dr. J. A. Kiernan, chief, for the control and eradication of tuberculosis of live stock, has been extended to include active cooperation with 43 States. The live-stock sanitary officials of these States are extending all possible cooperation. States not cooperating with the department are in most instances unable to do so because of unsuitable laws or lack of funds. Cattle owners throughout the country, including those in States not doing cooperative work, are becoming more and more interested. The plan of accrediting tuberculosis-free herds of cattle and the law under which indemnity may be paid for reacting animals have been of great value in advancing the campaign. For carrying on its field work for the eradication of tuberculosis the bureau has offices in 33 cities in as many States, an increase of 10 during the fiscal year.

TESTING CATTLE FOR TUBERCULOSIS.

Under the supervision of bureau officers there were tested with tuberculin 329,878 cattle, of which 13,528, or 4.09 per cent, reacted. A summary by States is given in the accompanying table.

Summary of tuberculin testing of cattle in cooperative tuberculosis-eradication work.

States.	Cattle tested.	Cattle reacted.	Percent reacted.	States.	Cattle tested.	Cattle reacted.	Percent reacted.

The District of Columbia gives an illustration of what may be accomplished during a term of years by the systematic testing of cattle for tuberculosis and properly disposing of reactors. Work of this kind has been under way in the District for 10 years. At the be-

ginning of this period the tuberculin test showed that 19 per cent of the cattle were tuberculous. During the past fiscal year 1,264 cattle in the District were tested and only 8 reactors obtained, a percentage of 0.63. Three hundred and seventy cattle in interstate movement were also tested for admittance into the District of Columbia, and of this number 30, or about 8 per cent, were found to be infected with tuberculosis.

INSPECTION AND TESTING FOR INTERSTATE MOVEMENT.

During the year there were inspected by bureau veterinarians, in compliance with the laws of the States to which the animals were destined, 41,609 cattle moved interstate for purposes other than immediate slaughter, of which 40,586 were tested with tuberculin. Of the number tested 1,182 reacted.

ACCREDITED TUBERCULOSIS-FREE HERDS.

The movement to establish and maintain a list of herds of purebred cattle officially accredited as being free from tuberculosis has met with wide favor among herd owners and is spreading rapidly. The plan, in brief, is to test the cattle with tuberculin at the request of the owner, to eliminate any reacting animals either by slaughter or by following prescribed sanitary measures, to repeat the test at prescribed intervals, and to list as tuberculosis-free accredited herds all herds entitled to that distinction. Official certificates are issued to the owners of such herds. Two lists of accredited herds have been compiled and printed. Up to April 1, 1919, a total of 782 herds, containing 12,082 purebred and 6,939 grade animals had been fully accredited, and 6,535 herds comprising 39,558 purebred and 57,685 grade animals had been listed as having passed one test.

CATTLE SLAUGHTERED AND INDEMNITY PAID.

October 1, 1918, funds became available to the bureau for the payment of indemnity for tuberculous animals slaughtered in the work of eradication. Indemnity was paid partly by States and partly by the Federal Government. The accompanying table gives statistics of cattle slaughtered, appraisal, indemnity, salvage, etc.

Cattle slaughtered, appraised value, indemnity allowed, and salvage realized in work of tuberculosis eradication, October 1, 1918, to June 30, 1919.

State.	Number of cattle.	Average appraisal per head.	Total State indemnity.	Total Federal indemnity.	Average State indemnity per head.	Average Federal indemnity per head.	Average salvage per head.

DIVISION OF HOG-CHOLERA CONTROL.

The Office of Hog-Cholera Control was made a division in April, 1919, and Dr. U. G. Houck was appointed chief of the division to fill the vacancy created by the resignation of Dr. O. B. Hess.

COOPERATIVE WORK FOR CONTROL OF HOG CHOLERA.

The work for the control and suppression of hog cholera progressed along the lines of the preceding year, in cooperation with the regulatory authorities and the extension divisions of agricultural colleges in 34 States where hog raising forms an important part of the farming activities. For a time as many as 180 bureau veterinarians were assigned to hog-cholera control work, but the average for the year was about 135.

Through the increase of the field force, which was made possible by the increase of funds from the war emergency appropriation, the swine industry received more protection against losses from hog cholera than ever before. Notwithstanding an increase of over 4,000,000 above the number of hogs in the preceding year as a result of efforts to stimulate production, besides the abnormal conditions that prevailed as a consequence of the war, the mortality of swine from all diseases showed a slight decline, from 42.1 per 1,000 in 1918 to 41.4 per 1,000 in 1919, or about 37 per 1,000 from hog cholera. This is the lowest point recorded in 36 years.

Hogs shipped from public stockyards into the various States for feeding purposes were kept under observation at destinations for a time to observe the results of the hog-cholera preventive treatment administered at the yards before shipment. The observation of these animals added materially to the duties of both bureau and State inspectors, as 614,673 feeder hogs were immunized at public stockyards and shipped, which was a great increase over any previous year.

Many garbage-feeding stations in the vicinity of large cities and military and naval camps were kept under observation, as such places are always liable to become centers of infection.

SUMMARY OF ACTIVITIES.

During the year 12,336 outbreaks of hog cholera were reported to the bureau inspectors by county agents, live-stock owners, and others. These outbreaks were investigated in cooperation with the State authorities. Under the direction of those authorities 9,564 farms were quarantined on account of outbreaks of the disease, and 4,382 were cleaned and disinfected. A total of 51,022 farm investigations were made on infected and adjacent premises, and 53,586 post-mortems were held to determine the nature of the disease that existed among the animals on the farms visited by the inspector.

Literature on the subject of hog cholera was widely distributed, and 2,734 meetings were held in hog-raising districts for the purpose of forming organizations and giving information and instructions to live-stock owners concerning quarantine, sanitation, and the serum treatment as successful means for preventing losses from hog cholera. These meetings were attended by 78,584 farmers and others. In addition, the inspectors held personal interviews with 315,359 live-stock owners, veterinarians, county agents, bankers, and others.

In all, 93,512 farms were visited by the bureau inspectors, at the request of the owners or otherwise, to observe the condition of live stock and to give advice and other assistance.

To demonstrate to veterinary practitioners and others the proper technique in administering the protective serum treatment, 233,987 hogs were treated.

Veterinary practitioners and others trained to administer the hog-cholera preventive treatment, and working in cooperation with the bureau forces, reported the treating of 5,474,685 hogs in the 34 States where bureau veterinarians are stationed. Since it is estimated that less than 50 per cent of the hogs treated are reported to the State and bureau authorities, it is conservatively estimated that the treatment was administered to more than 12,000,000 hogs in the United States during the year. A notable effect of the year's work during the past year has been the great increase in the use of serum by hog owners.

PATHOLOGICAL DIVISION.

The scientific investigation of animal diseases has been, as heretofore, the principal work of the Pathological Division, under the direction of Dr. John S. Buckley, chief. In addition, the division has studied the poisoning of live stock by plants, has aided in the supervision of viruses, serums, and other stock remedies, and has carried on certain routine work relating to diseases of animals.

INFECTIOUS ABORTION.

The study of infectious abortion has been continued in an effort to acquire further information that may be advantageously utilized in combating this serious malady. The manner in which the disease is introduced into abortion-free herds is regarded as sufficiently well understood to enable stock owners and dairymen by practicing reasonable precautions to keep healthy herds clean; but the control and elimination of the infection after it has made its appearance continues to be a perplexing problem.

Increased interest has more recently been manifested in methods of artificial immunization as a result of experiments conducted by

English investigators where promising results followed the employment of a living abortion-organism vaccine administered shortly before the animals were bred. A considerable amount of experimental work has been conducted along similar lines during the last two years. When a limited number of susceptible animals were utilized in an experimental capacity the results strongly indicated that protection could be conferred, but when the same method was applied to upward of 600 animals in an infected herd only a very slight reduction in abortion losses was accomplished. Results have indicated that only susceptible animals derive possible benefit from the method, no decrease in losses having resulted from the treatment of animals giving positive reactions. While the results obtained under experimental and herd conditions were somewhat contradictory, sufficient evidence that immunity was conferred in some instances was obtained to justify further immunizing investigations.

Additional evidence was obtained that bulls giving positive reactions to the abortion tests may harbor abortion infection in their generative organs and that the presence of the infection may be associated with definite lesions. The findings in five cases are described in a paper appearing in the *Journal of Agricultural Research*.

While abortion disease up to the present time appears to have interfered to only a slight extent with the swine industry, further evidence has been obtained that abortion infection is capable of causing losses in some instances in hogs. The presence of the infection was definitely established in one outbreak in Indiana, and on six other farms in the same State where abortion losses had been heavy among sows abortion infection was indicated by positive agglutination reactions.

Serological tests have been applied to several hundred samples of blood serum from suspected cases, and the definite knowledge thus gained as to the presence of the disease in many cases has enabled cattle owners to adopt appropriate control measures.

Cooperative research work by investigators at the veterinary department of Cornell University, in connection with an outbreak of disease in a flock of 235 Merino ewes where 50 per cent or more aborted or produced immature lambs, disclosed as the probable causative factor a spirillum, a type of microorganism not hitherto recognized in this country as associated with ovine abortion, although a similar type of organism had been previously isolated from aborting cows in this division. Severe abortion losses in sheep in Great Britain have been attributed to a similar if not identical type of infection. The losses from ovine abortion in this country up to the present time have been slight.

BACILLUS X AND EQUINE INFLUENZA.

An organism morphologically and culturally closely resembling *Bacillus subtilis*, and designated as Bacillus X by its discoverer, has been incriminated as a factor in the cause of equine influenza, and studies have been made of that organism in relation to the disease. Results of investigation show that no serological relationship exists between Bacillus X and *B. subtilis*. Large doses of Bacillus X failed to produce any evidence of disease when injected into guinea

pigs, rabbits, or horses. Agglutinins and specific complement-fixing bodies are demonstrable in hyperimmune serum.

In a test for toxin production, horses were temporarily discomforted by large injections of sterile bouillon filtrates of this organism, after which the animals remained normal. Guinea pigs and rabbits showed no ill effects from injections of this filtrate. The filtrate showed distinct antigenic properties when used as an antigen against serum from horses hyperimmunized against *Bacillus X*.

Complement-fixation tests with *Bacillus X* as an antigen, on a limited number of serums for animals affected with influenza or recently recovered from that disease, resulted in negative reactions in all cases. Several of these serums in low dilutions showed some agglutinating power against *Bacillus X* suspension. This same agglutination was also evidenced in certain normal horse serums in which exposure to influenza infection could be reasonably excluded.

DOURINE INVESTIGATIONS.

The complement-fixation test has continued to be extensively employed for the diagnosis of dourine of horses, 46,819 samples of serum having been tested, of which 1,143, or 2.4 per cent, gave positive reactions.

Experiments are being made on drying trypanosome suspensions for the purpose of preparing permanent dourine antigens of unvarying titer. Out of three lots of trypanosomes dried, one retained its antigenic value for one year at low temperature and in vacuum, but lost all antigenic value after three months' exposure to room temperature and air.

OTHER RESEARCH WORK.

In cooperation with the Bureau of Chemistry, experimental studies were made with a strain of *Bacillus botulinus* isolated from home-canned asparagus. As an antitoxic serum effective against a strain of the bacillus isolated from cheese afforded no protection to animals injected with toxin from the asparagus strain, experiments are being made for the production of what is known as a polyvalent serum against botulism.

Bacteriological and biochemical studies of conditions in culture media and living tissue which favor the development of toxins and aggressions by the blackleg bacillus are in progress.

Seven cases of spontaneous tumors in white mice were examined, and from this material experiments in the transplantation of tumor particles and the breeding of mice have been undertaken in cooperation with the Biochemic Division with the object of further research work on tumors.

A series of experiments with butter-coloring matters including Jersey yellow, Sudan diazo-anido-benzine, etc., was undertaken in cooperation with the Bureau of Chemistry, to observe the effect on the skin. Microscopic studies were made of the cutaneous structures of experimental animals. The results proved the irritant action on the peripheral as well as the deeper parts of the skin.

Eleven samples of animal tissue and stomach contents were examined for poisons. In three tissues from a smelter region, zinc was found in two and lead and zinc in the third.

EXAMINATIONS FOR TUBERCULOSIS.

Specimen tissues from 176 cattle that had reacted to the tuberculin test but in which no visible tuberculosis growths had been found on ordinary post-mortem examination, were referred to the Pathological Division for final diagnosis. Tubercle bacilli were demonstrated in 85 cases, while none could be found in the specimens from the remaining 91.

GLANDERS.

Cooperative work for the control of glanders in various States was continued. The complement-fixation test was applied to 695 samples of serum forwarded by various State officials and practicing veterinarians; 174 of these samples gave positive reactions to the test, a per cent of 24.8.

RABIES.

Specimens submitted for examination for rabies came principally from Maryland, Virginia, West Virginia, Tennessee, and the District of Columbia. The number of cases in the District has perceptibly diminished. Of 117 suspected cases a positive diagnosis was made in 75, and in one case the material was so decomposed that no diagnosis was possible. The positive cases were 69 dogs, 1 cat, 4 cattle, and 1 sheep. A considerable number of persons, as well as a number of animals, had been bitten by the affected animals. In every instance in which a person had been bitten, animal inoculation was made when the microscopic findings were negative.

BLACKLEG VACCINE.

Vaccine for immunizing cattle against blackleg is still in great demand. During the year, 3,339,815 doses were distributed free of charge to stock owners. The powdered form of vaccine that has been prepared by the bureau for many years is the only form distributed. Filtrates and aggressins, which many stockmen find very satisfactory in the immunization of their calves against blackleg, are being submitted to very careful tests to see that they possess the required protective qualities.

EXAMINATION OF BIOLOGICAL PRODUCTS.

Cooperating with the Office of Virus-Serum Control, which conducts the regulatory work in connection with the supervision of veterinary biological products under the virus-serum-toxin law, the Pathological Division has continued to carry out the testing of certain products. During the year there were submitted for examination 139 samples representing 30 different kinds of serums, bacterins, vaccines, and germ-free filtrates. Forty-two of these, or 30 per cent, were rejected for reasons such as contamination with foreign organisms or their products, insufficient attenuation of bacteria used in vaccines, and lack of potency. Three hundred and thirty-seven cultures of organisms intended for use in the manufacture of biological products were also examined, of which 72, or 21 per cent, were rejected because of contaminations and atypical cultural characteristics. The division also furnished to biological houses from its stock cultures many organisms of various types to be used in the manufac-

ture of their products. The suggestions made to the various firms relative to their products, together with the report of the division findings in each instance, have served to induce greater accuracy in identifying cultures and testing their products, as it is exceedingly rare to find a second sample unsatisfactory to test. The effect of such work is to exclude from the market unsuitable and impotent products and in some instances products that are even dangerous to the live-stock industry.

POULTRY DISEASES.

Extensive outbreaks of a highly infectious disease of poultry were reported from some of the Eastern States. Carcasses of fowls submitted to the laboratory for examination were found to be affected with fowl typhoid, a disease quite similar to fowl cholera, though caused by a different microorganism. In severe outbreaks it is almost as destructive as cholera. Information as to methods for control were given through bulletins and correspondence.

Avian material forwarded to the laboratory for diagnosis showed a variety of diseased conditions, the more important of which were white diarrhea of chicks, diphtheria and chicken pox, enterohepatitis or blackhead of turkeys, avian tuberculosis, and coccidiosis. Experiments were conducted to determine the relationship of coccidiosis of fowls and cattle. Fowls fed on material containing coccidia from cattle failed to develop coccidiosis.

AUTOPSIES ON WILD ANIMALS.

During the year 80 specimens of wild animals were received from the National Zoological Park (D. C.) for post-mortem examination. Of 45 birds examined there were 12 cases of enteritis, 2 of septicemia, 1 of peritonitis, 1 of sarcomatosis, 1 of parasitism, 1 of anemia, 1 of ptomaine poisoning, 2 of hemorrhage, 13 of tuberculosis, 3 of aspergillosis, 1 of cecal necrosis, and 7 undetermined. Of 35 mammals there were 5 cases of pneumonia, 1 of bronchopneumonia, 1 of pleurisy, 3 of enteritis, 2 of gastroenteritis, 4 of septicemia, 1 of peritonitis, 2 of tumors (adenomata sarcoma), 1 of parasitism, 3 of anemia, 1 of septic metritis, 7 of tuberculosis, 1 of prolapse of rectum, and 3 destroyed as unfit for exhibition (1 paraplegia, 1 extensive local infection of intermaxillary region, 1 severely injured).

PLANT POISONING OF STOCK.

In the investigation of poisonous plants nearly all the field experimental work has been conducted at the experiment station near Salina, Utah (provided by cooperation of the Forest Service), while most of the laboratory work has been done at Washington. The Bureau of Plant Industry has cooperated in the study of the plants. Its representative not only identifies the plants studied but carries on field investigations on their distribution and habits.

The work of chemical investigation of plants, begun in the preceding year, was considerably extended and advanced. More extended work was done also on the pathology of the diseased animals, and this has added to the knowledge concerning the effects of the poisonous principles.

A large number of plants have been under investigation. Special attention was paid to the "whorled milkweed" (*Asclepias galioides*),

which occasions extremely heavy losses of domestic animals in Colorado and adjoining States, and a bulletin on this plant has been prepared for publication. Further work was conducted on the sneezeweed (*Dugaldia hoopesii*), and additions were made to the number of known loco plants. An investigation was also made of a plant growing in the Southern States, *Daubentonia longifolia*, which seems to be an important sheep-poisoning plant in Texas.

Among publications of the year was Department Bulletin 575, "Stock-Poisoning Plants of the Range," a popular treatise, with colored illustrations, intended to aid stockmen in recognizing and identifying such plants.

BRANCH LABORATORIES.

The branch pathological laboratories at Chicago, Omaha, and Denver have continued their work, which consists principally in making diagnoses of obscure cases arising in the meat inspection.

The Chicago laboratory also collected and examined a number of samples of water from various meat-packing establishments, made a report upon the existence of the avian type of tuberculosis in swine, and conducted some experiments with reference to the transmissibility of so-called hyperplasia of the bone marrow in cattle.

The Omaha laboratory received and examined 308 specimens representing the usual variety of routine diagnoses. Examinations for tuberculosis and hemorrhagic septicemia have increased, the former due to cases of slaughter following reaction to the tuberculin test. The similarity of lesions found in cases of certain affections of swine to lesions of hog cholera made diagnosis sometimes difficult.

Investigations pertaining to abortion disease have been made by the branch laboratory at Ithaca, N. Y.

BIOCHEMIC DIVISION.

The work of the Biochemic Division, under Dr. M. Dorset, chief, comprised chiefly, as before, investigations concerning hog cholera, laboratory research work relative to meat products, studies of dips and disinfectants, and the preparation of tuberculin and mallein.

HOG-CHOLERA INVESTIGATIONS.

The investigative work on hog cholera has been continued under three general heads: (1) Methods of producing immunity, (2) modes of spread of the disease, and (3) the causes of hog cholera and related diseases.

METHODS OF PRODUCING IMMUNITY AGAINST HOG CHOLERA.

Some additional work has been done with methods for refining old hog-cholera serum (defibrinated blood). The method referred to in last year's report, consisting in the addition to old serum of strong solutions of sodium chlorid, followed by heat with aeration, has been used further and found apparently satisfactory. It has been found also that the use of strong solutions of sodium chlorid may be dispensed with when the serum is diluted with several volumes of 1 per cent salt solution, containing a sufficient amount of phenol to produce a concentration of one-half of 1 per cent in the final mixture. This diluted serum is heated and aerated as in the other method. It has

been found possible by this process, which includes filtration and precipitation of the globulins and antibodies, to refine and concentrate old defibrinated-blood antitoxin.

A further study of the effect of phenol (0.5 per cent) on the tuberculosis bacillus has indicated that the phenol alone can not be depended upon to destroy that organism in clear serum or in defibrinated blood, though it appears, after prolonged contact, either to attenuate the bacilli or to reduce the numbers very materially.

As a means of overcoming difficulty experienced by commercial firms in effectively maintaining proper temperatures in heating serum, the division has devised a method which makes it possible to heat serum at a definite temperature for any desired period of time without the use of the thermoregulator customarily employed. This is accomplished by the use of a double-jacketed kettle, the outer jacket of which contains a liquid which boils at a temperature exactly sufficient to maintain the desired degree of heat in the serum itself.

Some progress has been made in the study of the duration of immunity in suckling pigs. One hundred and thirty-nine pigs given the simultaneous inoculation when very young (less than 3 weeks, some of them but 1 week old) were exposed to hog cholera by the injection of virus six months after simultaneous inoculation. Three of them died, but it was not possible to establish that even they died of hog cholera.

Experiments by the division have shown that the condition of the immune hogs which serve as serum producers is of prime importance in the production of potent serum. The influence which the time elapsing between immunization and hyperimmunization might exert upon the potency of the serum produced was studied and at the same time studies were made of diluted and laked virus blood as hyperimmunizing agents. The experiments show that hogs which are hyperimmunized within a short interval after a simultaneous inoculation do not produce serum of satisfactory potency; also that as a rule the ability of hyperimmunized hogs to yield potent serums increases within certain limits as the interval between immunization and hyperimmunization increases. The conclusion was therefore reached that an interval of not less than seven weeks should be allowed to elapse between immunization and hyperimmunization, and that the most uniformly satisfactory results will be obtained by allowing at least three months. The ability of immune hogs to respond to hyperimmunization to the desired degree, once acquired, remains unimpaired for at least a year. It was found also that simultaneous inoculation of nonimmune pigs with serum and virus is followed almost immediately by a remarkably firm immunity, so that they are able to withstand enormous doses of virus blood within a day or two after simultaneous inoculation; hence there is no evidence of a state of hypersusceptibility to hog cholera following simultaneous inoculation. Diluted and laked virus blood was found not to possess any advantages over the undiluted blood. A full report of this work has been published in the *Journal of the American Veterinary Medical Association* (vol. 8, n. s., p. 259).

MODES OF SPREAD OF HOG CHOLERA.

Studies of the relation of insects to the spread of hog cholera have been continued. Studies of the hog louse (*Hematopinus suis*) have indicated that this parasite is incapable, under ordinary conditions, of transmitting the virus of hog cholera. Most of the work during the year related to the spread of hog cholera by means of flies, the common house fly (*Musca domestica*) being used as a representative of the nonbiting fly, and the stable fly (*Stomoxys calcitrans*) as a representative of the biting fly. Both species are commonly found about hog pens, and both are capable of traveling considerable distances. It was learned that individual house flies which feed upon the eye secretions or blood of sick pigs may harbor the virus of hog cholera for some days at least, and may convey the disease to healthy pigs by feeding on their eyes or on fresh wounds on their skins; yet other experiments with nonimmune pigs which were placed in screened pens in which infected house flies were liberated in considerable numbers, without the production of a single case of infection, leave a very grave doubt as to whether under natural conditions the house fly is concerned in the dissemination of hog cholera. Likewise it was demonstrated that it is possible for the stable fly to convey infection, either by feeding upon the ears of infected pigs and then biting nonimmune pigs, or by becoming gorged with the blood of sick pigs and then being killed and placed in the feeding trough of nonimmune pigs; but it yet remains to be determined whether this insect is a factor of practical importance in the spread of the disease. Attempts were made to transmit hog cholera by means of mosquitoes, but the experiments were unsuccessful. A summary of a large part of these investigations was published in the Twenty-Second Annual Report of the United States Live Stock Sanitary Association, page 164.

In continuation of work reported last year, four experiments were made under farm conditions in the vicinity of Ames, Iowa, to determine how long the virus of hog cholera persists in pens after the removal of sick pigs. On four farms where hog cholera existed all hogs were removed and susceptible pigs were placed in the vacated lots after intervals of 24 hours, 48 hours, 7 days, and 10 days, respectively. In the first case, 1 of the 6 susceptible pigs sickened on the eighth day following exposure and communicated the disease to the others. In the 48-hour and 10-day experiments all the susceptible pigs remained well. In the 7-day experiment 1 sickened and died, though it could not be determined definitely whether it had contracted cholera, while the other 5 remained well. These experiments are merely the beginning of a line of work which seems to be of practical importance and which it is planned to continue as opportunity is found.

CAUSE OF HOG CHOLERA AND RELATED DISEASES.

In the fall of 1918 investigations of diseases related to hog cholera and resembling it were begun. An infection of this character appeared on a farm near Ames, Iowa, among shoats which had previously been given the simultaneous inoculation against hog cholera. The animals presented many of the symptoms commonly seen in cases of hog cholera, but investigation proved that it was a different

disease, as hogs which were firmly immune against hog cholera contracted the other disease when exposed in the infected lots. The main characteristics of the disease were an inflammation of the large intestines, which showed on dissection a superficial layer of necrosis on the mucous surface, while beneath this there was a zone in which hemorrhage was more or less marked. The condition thus observed was no doubt what has been commonly termed necrotic enteritis. Microscopic examination revealed in the zone beneath the necrotic area typical threads of *Bacillus necrophorus*. Rabbits inoculated with bits of the diseased intestine developed typical necrophorus infection. The disease seems to be increasing in prevalence in certain of the Western States, and further efforts are being made to discover its cause and means of prevention.

DIPS AND DISINFECTANTS.

The laboratory of dips and disinfectants received for examination 131 samples of stock dips, disinfectants, and miscellaneous materials.

During the calendar year, 1918, there were sent to inspectors in the field 804 test outfits for arsenical dips and sufficient supplies for making 584,500 tests; 9 test outfits for lime-sulphur dips and supplies sufficient to make 3,200 tests; 13 test outfits for nicotin dips and supplies sufficient for making 2,970 tests. There were thus provided a total of 826 new testing outfits together with supplies sufficient to make a total of 590,670 tests.

In research work a comparison was made of the relative advantages of arsenious oxid and iodine, both of high purity, as standard substances in iodimetry. The results were published in the *Journal of the American Chemical Society* (vol. 41, p. 351).

Considerable work has also been done on a study of methods for evolving gaseous formaldehyde for disinfecting purposes, and it appears that less expensive methods than the potassium permanganate method will be found appropriate. This work is being continued.

Of the various substances used in dipping animals the compound cresol solutions are the only ones for which no suitable field test is available. The field test, which affords a means by which the inspector in the field may assure himself that the dipping bath after completion is of the proper strength, is considered highly important in carrying on field dipping operations successfully. For that reason considerable study has been given to the development of a method for testing cresol solutions in the field. A method of field testing has been devised which appears to be sufficiently promising to warrant an early trial of it in the field.

The laboratory has also carried on experiments to find a substitute for linseed oil, which is now scarce and high priced, and which has been required heretofore in the preparation of compound solution of cresol and of saponified cresol solutions. It has been determined that soy-bean oil, or the fatty acids derived therefrom, are well adapted for the purpose and may be used at a considerable saving in cost.

Some additional work has been done upon problems relating to the disinfection of hides and of tannery effluents, relating particularly to the effect of heat and of chlorine upon anthrax spores in the effluent from soak vats. The results obtained do not differ materially from those heretofore reported.

A comparative study has been made of the germicidal value of Dakin's solution, eusol, chloramine T, and chlorin in aqueous solution. This work indicates that these different disinfectants vary in their action upon different microorganisms. A study has been made also to determine the effect of lime upon the germicidal efficiency of phenol and cresol. Lime seems to lower distinctly the germicidal value of both of these disinfectants.

RESEARCH WORK ON MEATS AND MEAT PRODUCTS.

The nature of the research work on meats was changed in order to meet war conditions, and investigations that had been undertaken with a view to the conservation of materials used in the curing of meats were continued and completed. It was established that high-grade meat can be cured as well in sterilized old pickle, properly strengthened, as in new pickle. It is entirely practicable, therefore, instead of discarding pickling solutions after use, to clarify, sterilize, and strengthen them and then use them again, with a considerable saving in the ingredients. Examinations showed that pickle after use still contained approximately, from 52 to 67 per cent of the original content of salt, from 44 to 74 per cent of the sugar, and from 41 to 80 per cent of the sodium nitrate.

An attempt was made to determine whether the entire quantity of sucrose (cane or beet sugar) used in curing meats could be replaced by some other sugar, so as to release the cane and beet sugar for general household purposes. Inquiry developed that there is generally an ample supply of substitutes for granulated sugar in the form of (1) "refiners' sirup," a by-product resulting during the manufacture of granulated sugar, and (2) corn sugar or dextrose, which is produced in several different grades. Practical curing experiments with meats in which several grades of corn sugar and refiners' sirup were compared with granulated sugar (sucrose) were carried out in four different meat-packing establishments. Nineteen tierces of hams, 19 tierces of sweet-pickled bellies, 9 boxes of fancy breakfast bacons, and 10 tierces of beef hams were cured. In these experiments several commercial grades of corn sugar or dextrose gave as good results as granulated sugar in the curing of hams, sweet-pickled bellies, and beef hams. The corn sugar did not appear to give quite as fancy a grade of bacon as the granulated sugar, but the results in this respect are inconclusive. The differences observed were largely due to slight variations in color, the bacon cured with corn sugar tending to become somewhat browner when fried than that which was cured with cane sugar. The refiners' sirup yielded satisfactory results in the curing of hams and sweet-pickled bellies (in fact it is now used to a considerable extent for this purpose), but it did not seem to give as good results in the curing of beef hams. On the whole, the results of this investigation indicate that corn sugar and refiners' sirup can be used successfully in the curing of pork in place of cane or beet sugar, and that if the need for rigid conservation of our sugar supply should again arise the entire quantity of sucrose ordinarily used in curing pork could be diverted to other uses without harm to the industry.

Investigations to determine the fitness of certain inedible oils as substitutes for lard oil as an ingredient in railway signal oil were terminated during the year. Signal oil is used largely in railway

trainmen's lanterns, the oil in most general use consisting of about 75 per cent of a standard grade of petroleum and 25 or 30 per cent of lard oil or sperm oil. Studies were made of whale oil, menhaden oil, and rapeseed oil as substitutes for lard oil. Extensive tests were made in the laboratories and practical tests were made through the cooperation of three of the large railway systems. Indications are that whale oil and menhaden oil are not well suited for the purpose. Rapeseed oil gave fairly satisfactory results in laboratory tests, but railway officials were of the opinion that signal oil made with it as a substitute for lard oil is inferior to the usual mixture of lard oil and petroleum oil. In view of those facts and because the emergency created by the war had passed, these experiments were discontinued.

The investigations in drying meats have likewise been discontinued, as there seems to be no pressing demand for meats in dried form since the conclusion of the war. The studies were carried far enough to indicate that meats could be dried and preserved in a dry state in edible form if this should become necessary.

A report on the composition and identification of meat extracts was contributed to the *Journal of Agricultural Research* (vol. XVII, No. 1, April 15, 1919). This paper, which is intended especially for chemists, health officers, and food-control officials, who have to consider the purity and proper labeling of meat extracts, contains much new information and gives directions for distinguishing extracts of different origins.

TUBERCULIN AND MALLEIN.

There were furnished to various Federal, State, county, and city officials 2,359,004 cubic centimeters of tuberculin for subcutaneous injections, an increase of about 46 per cent over the amount distributed during the preceding fiscal year; also 19,500 disks for the ophthalmic test for tuberculosis and more than 5,000 doses of ophthalmic tuberculin in liquid form. In addition 26,000 doses of intradermic tuberculin were prepared and distributed to various bureau representatives in the field. The ophthalmic and intradermic tuberculins were produced in an experimental way, but are not yet available for general distribution. The methods used in the production of these two special tuberculins have been developed as the result of the division's research work, which is still proceeding, with the object of producing a more efficient and active tuberculin than any heretofore available.

Laboratory investigations are being conducted to determine the influence of different nutrient materials upon the growth and activity of the tubercle bacilli, the object being to simplify and at the same time to improve the methods of cultivating those organisms in the production of tuberculin on a large scale.

The amount of mallein distributed has shown a great increase, due for the most part to the requests of the War Department. There were furnished to that department 1,275,680 doses of ophthalmic mallein and 1,655,130 doses of intradermic mallein, a total of 2,930,810 doses, while 113,750 doses of ophthalmic mallein were sent to State and Federal officials, making a grand total of 3,044,560 doses, an increase of 75 per cent over the amount distributed during the preceding fiscal year.

OTHER WORK.

Cooperative work with the Insecticide and Fungicide Board in the examination of insecticides and fungicides intended for use in the treatment of diseases of horses, cattle, sheep, swine, and goats has been continued. Sixty-three samples were examined, of which 39 were found to be misbranded or misbranded and adulterated. Thirty-five hearings were held by inspectors in charge in the Bureau of Animal Industry in various parts of the country, and a large number of cases were examined to determine the correctness of efficacy claims made on labels.

ZOOLOGICAL DIVISION.

The Zoological Division, under Dr. B. H. Ransom, chief, has continued the investigation of parasitic diseases of animals, and the study, collection, and determination of animal parasites.

ROUNDWORMS OF SHEEP.

At the bureau farm near Vienna, Va., experiments to determine methods of rearing lambs free from parasites, or as nearly free as practically possible, have been continued. Successful results have been obtained repeatedly by dosing the ewes with 1 per cent copper-sulphate solution in the spring before turning them out to pasture with their lambs, after which the lambs with or without the ewes are changed every two weeks to fresh pasture. If kept on separate pastures from the ewes the lambs until weaning are allowed in the stable with the ewes at night and during a period in the middle of the day. For pasture, fields of appropriate size planted in various forage crops are used; also, when available, fields from which crops have been removed in the course of regular farming operations. No fields are used that have been occupied by other sheep since cultivation unless at least a year has elapsed since such occupancy. During the fall and winter the lambs may be allowed to remain on the same field for longer periods—one or two months or even longer—and during the next spring and summer they are also moved to fresh pasture only occasionally. This method does not entirely prevent infection, but the number of stomach worms and other roundworms is kept down to such an extent that they cause no apparent injury. Experiments are now in progress relating to a method under which the lambs are changed to fresh pasture only every three weeks during the summer. The question of preventing or minimizing tapeworm infestation is also being studied.

ROUNDWORMS OF HOGS.

Investigations on the common intestinal roundworm of hogs (*Ascaris lumbricoides* or *A. suum*) have been continued. Supplementing laboratory experiments, a study of conditions in the field has been made. It has been found that ascariasis in pigs is of great importance as a cause of death and stunting of growth. Invasion of the lungs by the larvæ of *Ascaris* commonly causes pneumonia, the symptoms of which are popularly known as "thumps." Even if a pig survives the invasion of the lungs by the young parasites he receives a setback from which he never fully recovers, but remains in poor condition, fails to grow at the normal rate, and at an age when he should weigh 100 pounds may weigh less than 50 pounds, sometimes

less than 20 pounds. Under the usual conditions under which hogs are kept a considerable proportion of the young pigs die from ascariasis and many others are stunted in growth, so that the sum total of loss throughout the country is enormous. Methods of management to prevent losses from this cause are under investigation, and sufficient progress has been made to justify the belief that with comparatively simple precautions the damage caused by *Ascaris* can be reduced on any farm to an inconsequential amount. Several papers reporting the results of investigations on *Ascaris* have been published during the year.

TREATMENT AND CONTROL OF EXTERNAL PARASITES.

HOG MANGE.—Investigations thus far have shown that hog mange is spread mainly by direct bodily contact, that it spreads very rapidly among hogs of low vitality kept in small inclosures, that it spreads slowly among vigorous animals kept in pastures or in clean, well-lighted, roomy pens or buildings: that if not controlled there is a heavy loss from shrinkage, as well as from a high death rate: and, finally, that it can be eradicated by four dippings in a lime-sulphur or arsenical solution with intervals of six or seven days between dippings.

HOG LICE.—In experimental work one dipping or treatment with crude petroleum or cottonseed oil usually proved effective in eradicating hog lice. Extensive experiments were carried on with medicated hog wallows, and it was found that when properly constructed and used such wallows provide an effective and convenient means of treating hogs for lice and mange during hot weather.

CATTLE SCABIES.—Further experiments have confirmed former findings as to the efficacy of four dippings in lime-sulphur dip for the treatment of sarcoptic scabies of cattle. Farmers' Bulletin 1017 on cattle scab was issued.

SPINOSE EAR TICKS.—The pine-tar-cottonseed-oil remedy for ear ticks recommended in Farmers' Bulletin 980 is being used extensively in the Southwest with excellent results.

OTHER EXTERNAL PARASITES.—Experiments are in progress with reference to the relative value of different kinds of dips in protecting sheep from infection with scabies. Dips containing sulphur apparently protect a longer time than those not containing sulphur.

Herds of lousy cattle in different sections of the country have been examined at frequent intervals, and both biting and sucking lice have been found on some of the animals in each herd every month in the year. In summer they were found in small numbers, but they became more numerous and spread throughout the herd during the winter. The advisability of treating cattle for lice in the fall, before they go into winter quarters, even though they seem to be free from these parasites, is thus apparent.

ANTHELMINTICS AND TREATMENT FOR INTERNAL PARASITES.

Copper-sulphate solution was tested in the treatment of sheep for tapeworms and found only partly efficacious even when used in greater concentration than is used in the treatment for stomach worms.

In experiments to determine the most effective method of administering remedies to sheep with a view of promptly reaching the fourth stomach, better results were obtained with liquids than with pills or capsules. Apparently, however, there is not much uniformity in respect to the passage of the dose to the fourth stomach, though generally the dosing is more successful if the liquid is given slowly and with the sheep standing on all fours:

Experiments in the use of carbon bisulphid against bots in horses indicate that *Gastrophilus intestinalis* (*G. equi*) is more readily removed than *G. nasalis*, owing, presumably, to the location of many of the *G. nasalis* in the duodenum, and that 6 drams in a single dose is apparently the minimum amount that can be depended on to remove all the bots belonging to both species. It also appears that the administration of linseed oil in connection with doses of carbon bisulphid diminishes the efficacy of the latter drug against bots and ascarids.

MISCELLANEOUS INVESTIGATIONS ON ANIMAL PARASITES.

Investigations on the possible relation between swamp fever in horses and intestinal parasites have been carried on in cooperation with the Health of Animals Branch, Canadian Department of Agriculture. These investigations have as yet led to no definite conclusions and are still in progress. The investigations on the gape-worm of chickens have been continued.

Studies have been made of the effects of substances obtained from the tissues of *Ascaris*, *Ancylostoma*, sheep tapeworms, and other parasites upon the blood of various animals, and in some cases these substances have been found to have a hemolytic action; also in certain instances an agglutinating effect upon red blood corpuscles. It has also been determined that experimental animals in certain stages of trichinosis are highly sensitive to injections of blood serum from another trichinosis animal. Highly interesting results have been obtained in experiments with anaphylactic and precipitin reactions in which extracts of various species of parasites have been tested against one another. A preliminary report on the hemolytic action of *Ascaris* extracts has been published.

During the fiscal year 131 imported sheep dogs were examined for the presence of parasites transmissible to live stock. Of these 62 were free from intestinal parasites as determined by fecal examinations and 69 were infested. Twenty-two showed the presence of tapeworms and received anthelmintic treatment before release from quarantine. In one case the tapeworms expelled by treatment proved to be of the species known as the gid tapeworm. It is because of the danger of this tapeworm to livestock, especially sheep, that imported sheep dogs are subjected to quarantine. This is the first case of gid tapeworm that has been encountered since the inauguration of the quarantine, a number of years ago.

A study has been made of several species of flukes and the results prepared for publication. A comprehensive paper on the tapeworms of dogs and other carnivores, some of which are transmissible to human beings and live stock, has been published, also a report of observations on intestinal trichinæ. The portion of the Index-Catalogue of Medical and Veterinary Zoology relating to nematodes which has been prepared in cooperation with the Public Health Service is now being printed.

MISCELLANEOUS DIVISION.

The Miscellaneous Division, of which Dr. A. M. Farrington is chief, has continued its work relating to the personnel of the bureau and to veterinary education.

BUREAU PERSONNEL.

At the beginning of the fiscal year the persons in the employ of the bureau numbered 5,221. During the year there were 1,556 additions, made up as follows: Appointments, 1,458; transfers from other branches of the Government service, 16; reinstatements, 82. During the same period there were 1,956 separations from the service, as follows: Resignations, 1,087; deaths, 39; transfers to other bureaus or departments of the Government, 25; removals for cause, 8; all other separations, 797. This last item includes terminations of appointment by limitation or for administrative reasons, exclusive of separations for disciplinary reasons. At the end of the fiscal year the bureau personnel numbered 4,821, a decrease of 400 over the number at the beginning of the year. The unusually large number of resignations is accounted for by the fact that many of the veterinarians and lay inspectors resigned to accept other employment at higher salaries and that the special war work for stimulating agriculture was discontinued with the lapse of the special appropriation. The return of men who were in military service caused the bureau to terminate the appointments of many temporary employees. Because of the low salaries paid by the Government, the Civil Service Commission has not been able to supply a sufficient number of eligibles who will accept appointment. Nearly all the women who were employed to assist in meat-inspection work at the packing houses because men were not available have been replaced by men.

During the year nine civil-service examinations were requested and subjects and weights were furnished to the Civil Service Commission.

VETERINARY EDUCATION.

The regulations governing entrance to the examination for veterinary inspector were revised, effective September 5, 1918. The principal change consisted in raising the matriculation requirement to two years' high-school education of at least seven full units or their equivalent, instead of the former requirement of a first-grade civil-service examination, which is considered equivalent to a grammar-school education. The four-years' course of study is now in effect at all accredited veterinary colleges.

The Student Army Training Corps was inaugurated about October 1 at veterinary colleges as well as at other educational institutions, and applied principally to students who were high-school graduates. The War Department urged all veterinary students who were high-school graduates to attend State veterinary colleges. As many of these students had matriculated already at colleges where the session commenced about the middle of September, great confusion was caused by their transfer from one college to another. Following the armistice the corps was ordered disbanded the latter part of December, and still further confusion was caused by the return of many students to the colleges where they previously had matriculated. By reason of these disturbing elements the number of students in attendance at veterinary colleges was much less than

usual. The total number of freshmen enrolled in all veterinary colleges for the session beginning in the fall of 1918 was 264 against 338 for the preceding year. The combined attendance at all veterinary colleges was 1,114 against 1,841 for the former year. The number of graduates was 214 against 867 for the preceding year. Two of the five accredited agricultural colleges did not enroll any veterinary students, and the other three enrolled an aggregate of only 30. Because of war conditions which prevented it from procuring an adequate faculty, and the prospect of a small attendance of students, one veterinary college discontinued its sessions. One veterinary college in Canada was added to the accredited list. At the close of the fiscal year there were 17 accredited veterinary colleges in the United States and Canada and 8 in European countries.

OFFICE OF VIRUS-SERUM CONTROL.

The supervision of veterinary viruses, serums, antitoxins, etc., under the law of 1913, was continued by the Office of Virus-Serum Control, in charge of Dr. H. J. Shore until March 31, when he resigned, and since then the office has been in charge of Dr. D. I. Skidmore.

During the year licenses were issued to 84 firms for the preparation of 179 products for sale in interstate commerce, and 4 licenses were canceled.

Virus and serum for the prevention of hog cholera form a large part of the volume of products supervised. To determine the purity and potency of the serum and the freedom of the virus from contamination 8,480 tests of the former and 1,616 of the latter were made. The production was as follows: Serum, 673,297.647 cubic centimeters, of which 4,609,531 cubic centimeters was destroyed; virus for use simultaneously with serum, 19,963.053 cubic centimeters, of which 364,310 cubic centimeters was destroyed; virus for hyperimmunization of hogs for the production of serums, 181,750.862 cubic centimeters, of which 10,052.745 cubic centimeters was destroyed. The quantity of serum produced was very much larger than in any previous year. The demand for clear serum has increased greatly.

There were inspected and admitted to the premises of licensed establishments for use in the production and testing of antihog-cholera serum and hog-cholera virus 446,800 hogs and 3,400 calves, of which 1,187 hogs and 1 calf were rejected. In subsequent operations 25,585 additional hogs were rejected.

REPORT OF THE CHIEF OF THE BUREAU OF PLANT INDUSTRY.

WM. A. TAYLOR, *Chief of Bureau.*

AGRONOMIC AND HORTICULTURAL INVESTIGATIONS.

WHEAT.

The classification of American wheat varieties is progressing rapidly. Complete descriptions of about 135 commercially grown varieties have been given, and keys have been constructed by which

varieties may be classified and identified. This classification is being checked in the field again during the season of 1919 and will then be ready for publication.

In connection with the classification of wheats a very comprehensive varietal survey has been undertaken in cooperation with the Bureau of Crop Estimates. Schedules to determine the distribution of wheat varieties, the source from which they came, the date of their introduction into the community, and the percentage which each one represents of the total wheat acreage in the community have been sent out to some 65,000 crop reporters. The return schedules have been studied, and in thousands of cases letters of inquiry sent asking for additional information and for samples. For the first time in the history of wheat growing in America it will be possible to map the distribution of wheat varieties and to learn the large number of names under which the same varieties are known in different parts of the country.

In connection with the problem of the winterkilling of wheat it has been necessary to study the effect of different methods of seeding on the winter survival of the resulting plants. Preliminary cooperative experiments seem to indicate that drilling may be a factor in some sections. The geographic scope of these experiments is being broadened.

RICE.

A method of shocking rice developed cooperatively at the Crowley Rice Station in Louisiana proved its value again in the autumn of 1918. Wherever this method was used, comparatively little damage was done to the shocked grain by the heavy rains prevailing after harvest time.

Experiments to determine what crop may be grown profitably in rotation with rice in the Sacramento Valley again have resulted negatively. The data obtained indicate that cotton may become a commercial crop where the water table can be controlled and the crop planted early. A careful survey was made in portions of Georgia, Florida, and Alabama to determine what varieties and methods of growing will permit the production of rice without irrigation, in quantities sufficient for home use at least.

A general survey of Porto Rico was made in 1917 to determine the possibility of commercial rice growing on that island. This was followed by experiments undertaken cooperatively with the Porto Rico Experiment Station and with sugar planters at several points. This work is being continued during the crop season of 1919, and the results indicate that there is a promising outlook for commercial rice growing in Porto Rico. One variety produced a fair yield under conditions of drought so severe that the native varieties were a complete failure.

GRAIN SORGHUMS.

Long-continued experiments in the production and improvement of grain-sorghum varieties in the dry and elevated portions of the southern Great Plains area warrant the following conclusions concerning this group of grain crops so important in that section:

(1) Many varieties produce well in favorable seasons. Only well-adapted varieties produce well in the less favorable and in unfavorable seasons, which comprise about three-quarters of the total number.

(2) Earliness is the most important single factor in the varietal adaptation of grain-sorghum crops to the conditions obtaining on the high plains of the Texas Panhandle.

(3) Dwarfiness is the next most important factor in the adaptation of these crops.

(4) The combination of earliness and dwarfness is extremely efficient in insuring adaptation to environmental conditions which include frequent periods of drought.

(5) Dwarf milo, Dawn (dwarf) kafir, and Sunrise (early) kafir are shown to be well-adapted varieties.

(6) Dwarf milo and Dawn kafir are meeting with wide approval on the farms of the high, dry plains.

(7) Germination and stand are governed largely by local conditions at sowing time.

(8) Tillering, or the production of suckers, is a varietal or group character to some extent. In part, it is correlated with stand and seasonal conditions.

(9) The production of erect heads is largely a group or varietal character, but is influenced by the same factors as tillering.

BROOM CORN.

Experiments in the improvement and culture of broom corn have been conducted for several years at the Woodward Dry Land Field Station in western Oklahoma. The results indicate that in that district the crops should be sown in the first half of May or the last half of June. These seeding periods bring the crop into head either before or after the hot dry period which usually occurs about the middle of August. Spacing the rows 7 feet apart, with the plants twice as thick in the rows, gave no advantage over rows spaced 3.5 feet apart with the usual stand in the row. When harvesting is done while the seeds are in the dough stage, a higher yield and apparently a better quality of brush are obtained than when harvesting occurs at an earlier or later stage in the development of the plant.

PASTURE IMPROVEMENT.

The problem of improving pastures is becoming increasingly important, as the high prices of foods are more and more forcing attention to the only really cheap feed—pasturage. Confirmation of the bluegrass-pasture experiments, in which it was shown that heavy pasturing is much the best method, both agronomically and economically, has been secured by two investigators working on other pasture grasses. Better handling of northern pastures is a matter of great importance, but, unfortunately, available facilities for experiments and demonstrations are wholly inadequate.

On the coastal plains of the South, unless the soils are much affected by drought, carpet grass, supplemented with lespedeza, makes excellent pasture. As a rule, *Paspalum dilatatum* (golden crown grass) is also excellent. Efforts are being made, with the aid of a new stripping machine, to place carpet-grass seed on the market in adequate quantity. Several newly introduced grasses are promising as pasture possibilities, but the absence of any facilities for experimental trials makes progress very slow. The pasture problem on the Coastal Plain must be solved in order to bring about agricultural utilization of these lands at the present time.

RANGE IMPROVEMENT.

There is a constant demand for grasses that will increase the amount of feed on the semiarid range lands, over and above that

which may be secured by rational grazing of the land under fence. Sweet clover has proved very valuable, but much of the area is too dry for this plant. There is reason to believe that a systematic testing of the numerous grasses and legumes secured by botanical explorations in Central Asia will disclose species that will solve the problem.

VITICULTURAL INVESTIGATIONS.

The viticultural problem of the wine-grape districts of the Pacific coast from the production standpoint becomes one primarily of developing the Panariti and other currant grapes and the culture of the Ohanez and other late varieties, which it is believed can be produced advantageously in this country, with a view to their taking the place of the Almeria and other types of long-keeping grapes now imported into this country more or less from Spain and elsewhere. The results of investigations already in progress have seemingly demonstrated the practicability of growing these varieties on a commercial basis.

From the cultural standpoint, the use of cover crops in the Oakville Experiment Vineyard in California has demonstrated the importance of such crops in vineyard maintenance under such conditions as those obtaining there. The results from the experimental vineyards in California, which have been in progress for some 12 or 15 years, on resistant varieties, adaptability, congeniality, productiveness, etc., will serve as a basis for such modifications of the work as conditions may make necessary in the future.

The work with American bunch grapes has been confined chiefly to the use of fertilizers, pruning experiments, and other cultural features carried on in the experiment vineyard at Vineland, N. J. This vineyard has also served as a source of supply for raw material in connection with the fruit-utilization investigations, particularly in studying the value of different grape varieties for the making of unfermented juice.

The Muscadine grape investigations have continued to yield exceedingly important results. While the breeding investigations, which promise very much for this industry, were temporarily interrupted by war conditions, the work along other lines, particularly the utilization of Muscadine grapes, has been stressed both because of the relation of the utilization features to the food supply in the conservation of this fruit and the relation of this phase of the work to cultural problems. It has been determined that there is a pronounced difference in varieties in their value for the making of fresh juice and other products. The Thomas is the best of the varieties now commonly grown for unfermented juice, and it has high merit compared with other varieties for most other uses.

Under the cultural and particularly the pruning methods used in the experiment vineyard at the Pender Test Farm, Willard, N. C., excellent crops have been produced when, because of unfavorable climatic conditions, other vineyards and vines in the surrounding neighborhood have yielded little or no fruit.

SUBTROPICAL FRUITS.

The work with subtropical fruits has included studies of avocado varieties for Florida and citrus fruits for Florida, an investigation of the Satsuma orange varieties in the Gulf States, a study of avocado varieties for California, and the production of olives in California.

Of the avocado varieties in Florida the Trapp, which is the leading fall variety of the West Indian race, will probably be the one most commonly planted in protected localities for some years to come, as in the past. Of the Guatemalan varieties, which are thicker skinned and hardier than the West Indian avocado, the Fuerte, which has come to be one of the standard varieties of California, appears to be one of the best for conditions in Florida. It maintains there the same high oil content and other qualities that characterized it when grown in California.

Further work in California confirms the wisdom of the selections made by the California Avocado Association, announced in a circular published October 25, 1917, which recommends the Fuerte, Spinks, Blakeman, Lyon, Dickinson, Taft, Sharpless, and Puebla varieties. The Taft does not seem to be as hardy as many of the other varieties in the list, however, and for this reason it should be planted only in specially protected localities. Furthermore, it is a slow grower and the trees do not begin fruiting until they are 5 or 6 years old, which is at least two years later than most of the other recommended varieties. The Lyon does not make a very satisfactory growth except in the Montebello and Whittier districts. There is some question whether these two varieties should be retained in the list. The other six, however, appear to be specially well suited to California conditions. The Puebla is gaining in favor, and it will probably be extensively planted in the future.

A further study of Florida citrus varieties so far as they relate to oranges confirms the conviction, which is shared by officials of the Florida Agricultural Experiment Station, the State Plant Board, and a number of prominent nurserymen and growers, that the "accredited" list recommended by the Citrus Seminar in 1916 for planting in Florida should be continued. This list included, in the order of their maturity, the Parson (*Parson Brown*), Homosassa, Pineapple, Valencia, and Lue (*Lue Gim Gong*) varieties. Some growers and nurserymen believe that the Lue may be eliminated, as it resembles the Valencia in so many particulars.

Comprehensive investigations of the Satsuma orange industry in the Gulf States, and particularly in Alabama, have shown that there are at least three different varieties of these oranges being grown more or less extensively in this region and that the name Satsuma is, in fact, a group name rather than a variety name. This interpretation of the significance of this name explains many of the wide differences previously observed in the fruit grown and passing as "Satsuma oranges." The Satsuma varieties of principal importance are the Owari and Ikeda. The Zairai orange is found in a few orchards, but it is relatively unimportant except for the reason that, because of its unlikeness to other varieties, it may continue to create confusion if the fact that it does occur is not fully recognized.

In connection with the bud-selection work in California considerable attention has been given to the pruning of citrus trees. It is expected that the results of this work will be prepared at an early date for publication. The most striking features of these investigations have been what appears to be a clear-cut demonstration of the fact that the very heavy pruning practiced by some growers is

detrimental, but that a limited amount of pruning, wisely applied, is conducive to fruit production. Incident to the bud-selection work it appears evident that trees propagated from those having a high yielding record of desirable fruit require less pruning to keep them in good form and in good productive condition than do trees propagated according to ordinary nursery practices. The bud-selection work which has been in progress with citrus fruits in California for a number of years has been continued, though on a somewhat restricted scale.

From a practical commercial standpoint, the performance records of individual trees which have accumulated up to the present time are serving an exceedingly important purpose, in that they are used as a basis for choosing the trees selected as a source of bud wood by the California Fruit Growers' Exchange, through its bud-selection department. This department was organized for the purpose of furnishing buds cut from trees of known bearing habits to nurserymen or citrus growers who desired to use them for top-budding trees in their groves which were known to be relatively unproductive or which produced fruit of undesirable characteristics. The individual tree-performance records of the Ruby variety in a 10-acre orchard at Corona, Calif., have been continued, as during the two preceding years. The information thus obtained emphasizes the striking frequency of bud variation in this variety. This, in turn, emphasizes the importance of selecting buds for propagation not only from trees of known bearing proclivities, but even from limbs of known bearing proclivities, because trees are exceedingly common which in the main bear fruit of desirable type but have some limbs on which fruit that varies from the accepted standard is produced.

The records which are now being accumulated confirm more and more emphatically the previously drawn conclusion that the characteristics of the parent tree are perpetuated in the progeny with no important exception or variation. The progenies in experimental plantings are producing fruit comparable in every particular with that borne by the parent trees of large-yielding or other desirable characteristics, or, like the parent trees, they are barren or relatively barren.

In order that the standard strains of the different kinds and varieties which have been established may be fully maintained and the strains accurately recorded, additional descriptive notes and photographs of selected citrus trees and their fruits have been secured during the past year.

A large number of commercial citrus-performance records are being made, the interest of the growers having increased each year. The utility of these records is practical rather than scientific. They enable the grower to determine inferior trees for removal or top-working, as well as make possible the selection of superior trees from which buds for use in top-working may be obtained. It has been found that these commercial performance records can be made in Washington Navel and Valencia orange and in Marsh grapefruit orchards at an average cost of about \$1 an acre each year, while similar records in lemon groves cost about \$10, the difference being due to the greater number of pickings in the case of the lemons.

Considerable time has been devoted during the year to assisting growers in introducing individual-tree records and to the utilization of the data thus secured.

The progress of the bud-selection department of the California Fruit Growers' Exchange, which is the direct outgrowth of the work of the Bureau of Plant Industry, is of interest in the present connection particularly in view of the fact that more or less supervisory attention is being given to it. In the first year of this work, the representative of the exchange in charge of it handled a total of 260,000 citrus buds. These buds were sold to members of the exchange at the rate of 3 cents each and to nonmembers at 3½ cents each. Under these conditions the work was found to be self-supporting. The past year, owing to the increased knowledge that could be brought to bear in the work and the consequent better selection of bud wood, the price of buds was raised to 5 cents each to members of the exchange and 6 cents each to nonmembers. Under these conditions, the demand for buds has increased to such an extent that at the present time there is a greater demand for them than can be met. The citrus nurserymen who have used these buds have obtained better results from them than from the sucker-wood buds that were formerly used in propagation. Furthermore, it has become exceedingly difficult for nurserymen who do not use the selected buds in propagation to dispose of their stock when it is grown.

The work with olives has continued along the line of standardizing the varieties, of which there are apparently several being planted under the name "Mission." The varieties commonly planted have also been studied for the purpose of standardizing the product.

THE COMMERCIAL CULTURE OF SMYRNA FIGS.

The work on the life history and breeding of figs and caprifigs has been given a great impetus by the publication of a bulletin on the commercial culture of the Smyrna fig in this country.

The Smyrna fig industry is growing very rapidly in California, and thousands of acres are being planted every year. It is not improbable that this country will soon produce all the figs it needs.

Much of the success of Smyrna fig culture in California has been due to the fact that the United States Department of Agriculture has been able to maintain a caprifig orchard at Loomis, Calif., from which caprifigs have been distributed free to growers. Before this distribution was arranged for, many small growers of Smyrna figs became discouraged, and some even dug up their orchards. When Smyrna figs and caprifigs are planted together, the caprifigs do not bear enough fruits to properly caprify the crop until several years after the trees begin to bear. For this reason, a young orchard is dependent on importing the needed caprifigs during the first few years. It was to supply this need that a seedling fig orchard at Loomis was leased by the Bureau of Plant Industry and the general distribution of caprifigs to Smyrna fig growers arranged.

Many new varieties of caprifigs have been brought to light, some of them very important in commercial Smyrna fig culture. A number of strains of the Lob Ingir (the best type of Smyrna fig) have been found that seem to be immune to splitting and so appear very promising for commercial culture.

Many thousands of seedling figs have been distributed to cooperators in the fig-growing regions of California, Arizona, and Texas, and some promising new varieties have been originated by proper selection of male pollen.

In the fall of 1917 the fig insect was established in certain old seedling caprifig trees in Brunswick, Ga., and since then a number of other caprifig trees have been similarly treated. Thanks to this local supply of caprifigs, it has been possible to caprify and bring into fruiting many sterile seedling Smyrna fig trees growing in the Southeastern States. Some of these trees bear a very high grade of fruit, very promising for use as fresh fruit or for canning. It is still doubtful whether figs grown in the southeastern United States can be dried to advantage. At any rate, it is a matter of much interest and of some economic significance that many old sterile fig trees in this region are really Smyrna seedlings, approximately half being Smyrna trees and the others caprifig varieties.

COMMERCIAL DATE CULTURE.

Date culture, though still conducted on a small scale, is a recognized commercial fruit industry which gives promise of steady growth. The culture of the Deglet Noor, the finest of the imported date varieties, has already become well established in California.

At the present time American methods of date culture are probably more advanced than those of any other date-growing country in the world, in spite of the fact that our experience is limited to practically two decades.

NUT INVESTIGATIONS.

The work with nuts during the past year has been confined largely to pecans and has consisted for the most part in a continuation of studies previously inaugurated, including an investigation of the range of the species, the adaptability of varieties to different regions, methods of propagation, soil improvement, orchard management, and methods of harvesting, curing, packing, and handling the product.

From a continued study of varieties it appears that a considerable proportion of the varieties now being planted are so far below the general average of the best sorts in production and other important characteristics as to justify their elimination. It is becoming more and more evident that greater attention should be given to the matter of stocks for use in propagating pecans in the nursery.

A series of irrigation experiments begun during 1917 has been continued, although because of the rather heavy rainfall which has characterized the climatic conditions since the inauguration of these experiments there has been little opportunity to study the influence of the application of water during the dry periods which commonly occur and to which are attributed as a possible cause some of the adverse results experienced, such as the premature dropping of the nuts and other difficulties.

A series of fertilizer experiments begun in 1918 is being continued. Although the work is of too recent origin to report results, certain records suggest a slight increase in the yield of fertilized trees.

A further study of varieties is being made in the States bordering the area recognized as definitely within the pecan-growing territory. Planters in Oklahoma, Tennessee, Kentucky, Indiana, Ohio, Illinois, Missouri, and Kansas are becoming interested in the possibility of planting pecans and are seeking information with regard to varieties possessing the necessary qualities when grown under their conditions.

VEGETABLE STORAGE AND STORAGE LIFE FACTORS.

In cooperation with the Bureau of Markets, handling and life-history studies of tomatoes were carried on in Florida, particularly with a view to determining at what degree of ripeness tomatoes should be picked for shipment to northern markets in order that the best carrying qualities and the best dessert qualities might be realized. It was found, among other things, that the age of the tomato, that is, the time elapsing between the blossoming stage and the picking date, was of primary importance rather than the size of the fruits.

In the shipping tests with tomatoes it was determined that it was better not to wrap the individual fruits; the ripening process takes place better under full ventilation; if held under unventilated conditions offensive tastes and odors are likely to develop.

Freezing work on potatoes has been conducted, which is similar in character to the freezing work with relation to fruits, involving a determination of the temperature and the length of exposure to such temperature which will result in frost injury.

The behavior of celery, cauliflower, and lettuce when held in different storage temperatures has been critically studied. The practicability of storing these products on a very much more extensive scale than has been followed heretofore is indicated. Cauliflower, which as a rule has not been stored except for very brief periods, can apparently be held at a temperature of 32° F. for a period of 30 to 40 days.

A very limited amount of work has been done in the cold storage of flowers. The results secured in a preliminary way suggest the practicability of florists inaugurating very different methods of holding their flowers than those now in use wherever conditions may so suggest. Roses held at a temperature of 32° F. were in fair condition long after they would have completely deteriorated under the usual method of handling. Easter lilies after being stored for three weeks were removed in good condition and remained so for four days after being placed at common room temperature. Held for two weeks in storage Easter lilies stood up for five days in a warm room. Peonies and other flowers held up a surprisingly long time in a temperature of 32° F.

INVESTIGATIONS OF TRUCK-CROP PRODUCTION.

The work with sweet potatoes has been considerably enlarged both because of the need of fundamental information along certain lines and the importance of the crop in a large part of the country as a source of food. The work is carried on principally at Arlington Farm and at Florence, S. C., at the Pee Dee substation in connection with the South Carolina Agricultural Experiment Station. The work consists of a comprehensive study of varieties, for the purpose of working out a key by means of which varieties can be identified, and the varieties adapted to different regions and for such purposes as table use, stock feed, and as a possible source of sirup, sugar, and perhaps starch and other products, can be determined. Under the cultural and development phases of the work, investigations are being made in hill selection for the securing of seed stock, selections being made with regard to those having no string, those having a maxi-

imum number of strings, those having a maximum number of first-grade table potatoes, those having a maximum yield irrespective of size or shape, the latter having its particular application in the production of potatoes for stock feed and the making of sirup, sugar, starch, or alcohol, where a large yield is the primary feature. The object of the selections is self-evident, except that one where the selections are made with a view to producing the maximum number of strings; the importance of this is simply a matter of comparison and for securing a definite demonstration of the results in selection.

Investigational work in the curing of sweet potatoes was also carried on with very satisfactory results, it being shown that with proper handling and storage conditions sweet potatoes can be carried through the winter and as late as April 1 with not to exceed 1 per cent of loss from decay.

The work with peanuts has been along lines comparable with those followed in the sweet-potato work. Methods of planting, selection of seed, the improvement of yield, and cultivating and handling the crop have been studied. The study of varieties has made evident the fact that most of the so-called varieties now to be found in the trade are in fact merely old standard varieties with new or local names and that there are only about six distinct varieties grown in this country. Selected strains of some of these varieties are being made, with a view to producing those particularly adapted for definite purposes, such as the making of peanut oil a high-grade table and cooking oil, also employed in the manufacture of oleomargarine, and to some extent in making soap, etc., and also strains that are adapted for human food in the form of peanut meal, peanut butter, and other products. High-yielding strains are desirable for stock and dairy feeds.

IRISH POTATO INVESTIGATIONS.

The work under the Irish potato project previously inaugurated has been continued during the past year. These lines include a study and classification of varieties, a study of the adaptability of varieties to different conditions, selection studies in connection with the development of improved strains, a study of seedlings produced in breeding, studies of the best rate of seeding and of the use of whole or cut seed, and various other problems of a similar character.

In addition to these studies, all of which have been in progress for a number of years, attention was especially devoted to the development of improved seed stocks, it being realized that the seed stocks commonly available to potato growers contain many mixtures, not infrequently diseased and as a rule not as productive as they should be. It is a recognized fact that the yield of potatoes in this country is far below that secured in Germany and in some other countries. This difference is commonly attributed to the use of relatively inferior seed stock.

A collection of South American varieties of potatoes, including a number of the yellow-flesh types, has been grown for study each season for a number of years past. The full collection was grown in 1918, as it was the preceding year, at Swannanoa, N. C., and Presque Isle, Me., but without any very promising results, those obtained in 1918 being even less promising than were those in 1917. It now seems evident that, with the possible exception of two or three

varieties, this South American collection is without value for commercial purposes. The work with this group of potatoes will, therefore, be very much curtailed in the future.

The seed-improvement work is being carried on in cooperation with the agricultural experiment stations in practically all of the important potato-producing States. The best seed stock of the leading varieties in different regions is being grown in the different States. During the progress of the season the various plats are inspected several times for the purpose of eliminating diseased plants and those which are not true to name or true to type, and at the harvest period carefully studied selections are made for the purpose of obtaining the best strains of the different varieties. These potatoes in turn will be used for seed purposes with a view of developing stocks that are true to name, true to type, free from disease communicable through the seed and at the same time possess high-yielding proclivities.

VEGETABLE UTILIZATION WORK.

The investigations of the utilization of vegetables have been conducted primarily from the standpoint of the producer, with a view to securing information which will enable the farmer or the grower successfully and profitably to utilize his surplus crops or the crops which he may grow especially for drying or canning.

The activities have been directed toward the determination of varieties best adapted to the different purposes and to methods of procedure which will give a technique that the farmer can apply with reasonable assurance of the results.

In the canning of vegetables the fact has been developed that there is a very wide variation in the behavior of different varieties; for instance, certain varieties of beets appear to be much better adapted for canning than others. Methods of canning carried on with a view of determining processes which will give the greatest possible degree of success under the widest range of conditions are being investigated, it being recognized that most of the methods now used not infrequently give faulty results under many different conditions.

One of the most important activities has been directed toward the working out of satisfactory methods of canning sweet potatoes. The methods now used, both on the farm and by commercial canneries, result in a product which has a more or less burnt and otherwise unpleasant flavor. This burnt taste appears to be the result of caramelization. A method has been worked out whereby this is not only avoided but which results in a product that is essentially like the sweet potato when freshly prepared for table use. In the same connection canning tests of 34 different varieties of sweet potatoes have been made. These tests have shown a wide variation in the value of different varieties for these purposes. Other features of canning technique are being developed along the lines of the fundamental principles involved, which it is believed will have a far-reaching effect on farm canning.

BULB-CULTURE INVESTIGATIONS.

During the year one half of our bulb stocks have been removed to the new bulb farm at Bellingham. Owing to a shortage of labor the other half was left undug on rented ground. The total excess

production for the year was about 350,000 bulbs, or one minimum car-load, which supplied the entire quota of the congressional distribution. These stocks proved to be fully up to the standard. The narcissuses were especially commented upon as of superior quality. Of the minor lists of stocks not before handled, the Dutch irises, branching tulips, our native camassias, and some of the newer narcissuses have done especially well. The propagation of the lily is promising. Many species grow readily in this region by simply drilling the seed in open ground in autumn. Even such a species as *Lilium washingtonianum* is now promising under practically open-ground conditions, most of the plants not appearing above ground, however, until the second spring.

The preservation of bulbs taken out of beds after flowering has proved to be thoroughly practicable this season. Some 20 or more thousand tulips and narcissuses from the department grounds will give 80 per cent of flowering bulbs, besides an average increase of 160 per cent of small bulbs, which are just as good planting stock as can be secured anywhere. One year will bring the 80 per cent of flowering stock to first-class condition and half of the small stock to flowering size. This class of conservation is to be encouraged and no doubt will be practical now that bulbous stocks have doubled in price.

It has been demonstrated that the beautiful Palestine irises can be grown very satisfactorily in the Sacramento Valley, and probably in the other interior valleys of California. Our experiments show that a reproduction of 3½ fold may be expected the first two years after importation; also, what is known as the "Juno" group succeeds well here. In general, these groups, although in some respects the most attractive of the great iris family, have not been considered successful in this country up to this time.

The investigations of Easter lilies conducted at Arlington Farm, near Washington, have revealed a number of things of importance:

(1) Our seedling stocks after two years give a reproduction of bulblets which is ample for all purposes of propagation. This means that once a seedling strain has been developed a stock can be worked up very rapidly by vegetative methods, and these same methods will serve to continue the increase.

(2) Stem bulblets, which form in the axils of the leaves near the surface of the ground, are 6 to 12 in number under ordinary conditions, and several of them will give one, two, or three flowers the first year and grow to good flowering size with one year's cultivation.

(3) An increased bulblet propagation can be secured by plunging the pots, by hilling up around the plants, or by layering the stems.

(4) Seed dried for two or three months germinates in a shorter time than that which is sown immediately upon its maturity.

(5) Home-grown bulbs 3 to 6½ inches in circumference average three to five flowers to the stem when forced for Easter.

(6) A few flowers are secured in one year from seed.

(7) Seed sown in July, when carried on in pots, will produce bulbs which can be forced for the second Easter following.

(8) These facts enable growers to produce their own Easter lily bulbs from seed in one year's time, the seedlings being carried in pots. After flowering, the bulbs not disposed of can be carried out of doors south of Philadelphia and will be ready to force again after one year's recuperation.

(9) Stocks thus produced are free from disease.

CORN CULTURE.

Experiments have been conducted to demonstrate the practicability and value of the earlier planting of corn. Proof has been obtained that in many instances the earlier planting of large productive

varieties is much more profitable than the normal planting of early-maturing varieties. By much earlier than normal planting it has been found that larger growing varieties can be profitably grown for ensilage in northern localities and much better yields secured than by planting the smaller native varieties at the usual corn-planting date. In southern localities, by planting small short-season varieties earlier than normal much earlier maturity can be secured, thus affording a supply of corn for very early feeding. Many rather soft varieties produce sound corn when planted early in southern localities, but rot badly when planted late.

Investigations of cultural methods have shown that in localities where moisture is a limiting factor, the practice of planting in alternate rows short and long season varieties has increased yields as compared with either variety in pure plantings. It has also been observed that varieties differ in their ability to adapt themselves and their grain production to varying stands. When given increased spacing prolific varieties have shown ability to increase their grain production much more satisfactorily than have the single-ear varieties. This is an important factor in ordinary planting where missing places are frequent. In sections to which prolific varieties are adapted, they are more desirable than single-ear varieties because of their ability to make up by increased grain production deficiencies in stand.

Crossbreeding and experiments with unusual types of corn from different parts of the world promise interesting and profitable results.

Progress is being made in isolating uniform types within a variety. It has been found that so-called varieties of corn are largely conglomerates of many distinct types. In arriving at basic facts in breeding work it is necessary that these uniform types be segregated.

PLANT BREEDING.

WHEAT.

Wheat-breeding investigations in cooperation with the North Dakota Agricultural Experiment Station have resulted in the production of the Kota variety by selection from a mixture of Russian wheat. This is a hard red spring common wheat, both early and productive, with the additional valuable quality of high resistance to black stem rust. Preliminary milling experiments indicate that it is of good milling quality also. It will be increased for commercial growing and also will be used as a basis for further breeding.

Acme, a variety of durum wheat developed by selection from the Kubanka in cooperation with the South Dakota Experiment Station, is not only a high-yielding variety, but shows a high degree of resistance to black-stem rust. It has now been introduced into commercial cultivation in South Dakota.

In cooperation with the Cornell Agricultural Experiment Station in New York, there have been developed several superior wheat selections, both white kerneled and red kerneled. The work has progressed to the point where these selections are now being distributed to selected cooperating farmers in those sections of New York to which they are adapted.

Losses from the winterkilling of wheat have been very severe in different years, due apparently to several causes. Cooperative experiments in breeding wheat for winter hardiness have been established at the State experiment stations in Kansas and Minnesota. Already some promising winter-hardy strains have been assembled for use as a basis in breeding and studies of adaptation to severe conditions.

Very extensive studies of inheritance in wheat are being carried on at the Arlington Experiment Farm and at the Cornell Agricultural Experiment Station. Various characters of the wheat plant are being studied, including the inheritance of awns, color, and other characters of the glumes, color of grain, length of awns, straw characters, and various other characters that have a more or less economic importance. A very interesting feature of the work at the Cornell station is the synthetic production of a plant which is practically indetical with the wild emmer or so-called wild wheat of Palestine.

OATS.

In cooperation with the Iowa Agricultural Experiment Station, the oat variety Iowar has been produced by selection from the Sixty-Day variety. This is a high-yielding early strain of white oats, producing several bushels more per acre than ordinary varieties. It was first distributed to selected Iowa farmers in the spring of 1919, and about 250 acres were grown this season.

Extensive breeding operations for the improvement of oat varieties are being conducted in cooperation with the Cornell Agricultural Experiment Station. Several strains of high-yielding power for different districts in New York State have been developed and are now being grown by cooperating farmers in the districts to which they have been found adapted.

BARLEY.

Trebi, a 6-rowed barley, originated in cooperation with the Idaho Agricultural Experiment Station by selection from a mixture obtained in Asia Minor, has been found especially well adapted to conditions, both dry land and irrigated, in southern Idaho, where its commercial production was begun in 1918 and now totals about 3,000 acres.

The Sandrel variety, produced in cooperation with the Minnesota Agricultural Experiment Station by selection from a Californian barley obtained originally in Moravia, has given excellent results and has been distributed to agricultural experiment stations for further trial in order to determine its range of adaptability.

Barley breeding with definite reference to the inheritance of several important characters, such as awns, adherent hulls, color of kernels, and size and shape of embryo is under extensive investigation in cooperation with the agricultural experiment stations of Idaho and Minnesota.

VELVET BEANS.

The rapidly increasing importance of velvet beans in the South is perhaps the most striking agricultural phenomenon of recent years. It is due primarily to the development of new early-maturing varieties. A recently evolved variety, the Bush velvet bean, is entirely

nontwining in habit, thus paralleling a similar phenomenon which has before occurred in the garden bean, the Lima bean, the cowpea, the soy bean, and other annual beanlike plants. Of the numerous hybrids developed by the Bureau of Plant Industry one that has been called the Mississippi velvet bean is so promising that it is being propagated for general distribution.

SOY BEANS.

Interest has continued to increase throughout the country relative to the utilization of the soy bean, not only for forage purposes, but for oil and food products. The introduction of new varieties by the Bureau of Plant Industry has greatly extended the production area of the crop and therefore has brought about a greatly increased acreage, especially northward and westward.

The field work has been extended in testing out improved sorts in various sections of the country. A large amount of selection and hybridization work has been done, resulting in several quite promising sorts. Nearly all of the varieties now handled by growers and seedsmen were originated by the Department of Agriculture. During the past year the Mandarin has been introduced in the North as one of the most promising early-grain sorts. For the lands of the South infested with the wilt and nematodes the Laredo has been found highly resistant and is one of the most promising forage sorts.

The Biloxi, Virginia, Black Eyebrow, Man hu, and Wilson-Five varieties have been distributed over a wide territory and have given excellent results. The testing of varieties for food has determined that the Hahto for a green vegetable and the Easy Cook, a soft-boiling sort, as a dried bean are the best. The Hahto especially has been received with considerable favor. It has been widely distributed, several thousand packets being given to the boys' and girls' canning clubs of the South. In addition to developing forage and food value, breeding work has been conducted with varieties for high content of oil and protein.

TIMOTHY.

The new strains of timothy developed at Elyria, Ohio, at the forage-crop testing station, in cooperation with the Ohio Agricultural Experiment Station, still continue to prove superior to common commercial timothy in both pot and field tests. Investigations are now being carefully conducted with a view to solving some of the practical difficulties that lie in the way of establishing these strains in general use throughout the important timothy-growing sections of the country.

NEW CROP PLANTS AND CROP EXTENSION.

EGYPTIAN COTTON IN CALIFORNIA.

Many fields of Egyptian cotton were grown around Fresno and Bakersfield, Calif., in the San Joaquin Valley in 1918 and afforded striking demonstrations of the possibility of extensive production in this region. Not only were good yields obtained at the rate of a bale per acre, but the plants also showed an unusually regular and full development of the fruiting branches and bolls during the entire

season. Abortion of fruiting branches, buds, and bolls early in the season was much less common than in the Imperial and Salt River Valleys, and there was less injury from drought or other extreme conditions that often reduce the yields or impair the quality of the fiber in the southern valleys. In view of such differences of behavior there seems to be no ground for the fear that the growing season in the San Joaquin Valley may prove too short for Egyptian cotton.

WHEAT.

Early Baart, a hard white wheat, fields of which were surveyed in Arizona and California in 1918, was again grown on an increased scale in those States in 1919. Most of the expansion was based on seed from inspected fields. The results of this enlarged acreage are reported to be excellent.

The production of Dicklow, a white wheat of good quality, is being encouraged on the irrigated farms of the Snake River Basin in Idaho. A considerable extension of acreage took place in the spring of 1919, the total being about 8,000 acres, and excellent results are reported where sufficient irrigation water was available.

A selection of Dawson Golden Chaff wheat, resulting from cooperative experiments at the Cornell Agricultural Experiment Station, is now being distributed rather rapidly in New York State. The commercial fields of this variety are inspected each year in order that only pure seed of high quality may be used for the increasing acreage.

Kanred, a hard red winter variety, originated at the Kansas Agricultural Experiment Station, was inspected in commercial fields in Kansas in 1918, and some 400 fields of this variety were inspected by State officials in 1919. It is likely to become increasingly popular because of its resistance to leaf rust and stem rust, as well as because of its productiveness and high quality.

OATS.

The Albion and Richland, two superior early oat varieties, developed in cooperation with the Iowa Agricultural Experiment Station, are grown on an increasing acreage in Iowa and the adjacent States in the oat belt. The Albion (Iowa No. 103) is a selection from Sixty-Day. It is estimated that fully a million acres of it were grown in Iowa this year. The Richland (Iowa No. 105) is adapted to the more fertile alluvial soils, on which it yields about 4 bushels per acre more than the Kherson oat, from which it was developed. It is estimated that at least 50,000 acres were grown in Iowa in 1919.

Improved selections produced in cooperation with the Cornell Agricultural Experiment Station have been distributed commercially in cooperation with selected farmers, and their use is increasing in those sections of the State to which they are especially adapted.

BARLEY.

Owing to the decreasing demand for barley incident to the termination of the war and the advance of the prohibition movement, and owing further to the guaranteed price of wheat, it was feared that there might be a tendency to decrease the barley acreage in the

spring of 1919. Barley is a very important crop in the rotation in the States of the northern Mississippi Valley, as well as a very valuable crop for stock feeding. Active measures were taken in Wisconsin and Minnesota, especially, to emphasize the value of barley to the farmers of those States and thus encourage continued production.

RICE.

In California the commercial acreage of varieties introduced and improved by the Bureau of Plant Industry represented over 20 per cent of the total area of 106,220 acres in 1918. In 1919 this percentage is believed to be still larger.

GRAIN SORGHUMS.

Owing to the importance of the grain sorghums as drought-resistant crops, and in view of the long-continued droughts which have occurred in the western portions of Kansas, Oklahoma, and Texas during the past two or three years, another campaign was carried on in those States in the spring of 1919 to emphasize the value of these crops. The resulting acreage, while below that of 1918 because of the enormous increase in wheat, is slightly larger than that of 1917 and more than a million acres larger than that of 1916.

WINTER FLAX.

Under the supervision of a specialist, commercial sowings of winter flax were made for the first time in Arizona and southern California in February and March, 1919. These have now been inspected and harvested under supervision, and the seed either has been reserved for seeding an increased acreage next winter or arrangements have been made for shipping it to an oil mill, where its quality for oil production will be determined.

HARD FIBERS FOR BINDER TWINE AND CORDAGE.

The continued uncertainty of supply and the threatened shortage of henequen from Yucatan have caused serious anxiety lest there might not be enough binder twine to harvest the increasing crops of grain in this country. Investigations have been continued, therefore, with a view to finding new sources of supply or new regions where binder-twine fibers may be produced.

Field investigations have been conducted in southern Florida, Cuba, Haiti, Santo Domingo, Porto Rico, and the Virgin Islands.

HENEQUEN AND SISAL.—The conditions in extreme southern Florida and on the larger keys are regarded as suitable for the production of sisal and henequen fibers, provided the cost of land and of labor there is not too high to permit successful competition with other regions where these fibers are produced. A large commercial plantation is now being established by private capital in that region.

Henequen has been cultivated successfully for several years in Cuba, and the plantations are being increased there, but thus far they produce scarcely enough fiber to supply the cordage mills on that island.

In the Republics of Haiti and Santo Domingo it was found that most of the plants heretofore referred to as sisal or henequen were other species of agaves or furcraeas, which had been misidentified. Conditions are regarded as favorable for the production of binder-

twine fibers in limited areas in Haiti and over a much larger area in southern Santo Domingo. A small experimental planting of sisal has been made near La Romona, Santo Domingo.

In Porto Rico experimental plantings made in former years have resulted in the establishment of a commercial plantation near Yauco. Trial plantings of both sisal and henequen near Quebradillas, in northwestern Porto Rico, and on Mona Island, about 40 miles west of Mayaguez, are making a promising growth.

A fiber-cleaning machine of commercial type has been sent to the experiment station at Mayaguez, P. R., to demonstrate the production of henequen and sisal.

The development of improved strains of henequen and sisal by means of selections begun in 1917 at Mayaguez is being continued. Many of the second generation of suckers have been set out, and bulbils from the original selected plants which have sent up flower stalks are being grown in nurseries. The cultivation in several instances of bulbils and suckers from the same parent plant is expected to furnish more definite information than has been available heretofore regarding the relative merits of these two sources of propagating stock.

In the Virgin Islands excellent conditions for the cultivation of sisal, and probably henequen, are found on St. Croix, and there are now growing on that island sisal plants with leaves nearly 6 feet long that may furnish stock for starting a plantation.

In the Philippines the cooperation of the Bureau of Plant Industry with the Philippine Bureau of Agriculture in demonstrating the preparation of sisal fiber by means of modern fiber-cleaning machines has resulted in an increased planting of sisal on those islands and in the purchase and installation of machines by private capital to develop the sisal industry on a larger scale. The Philippine maguey plants are being replaced by sisal plants, which yield a fiber better adapted to the requirements of American manufacturers.

PHORMIUM, OR NEW ZEALAND HEMP.—The fact that phormium fiber may be used for binder twine and, furthermore, that this is the only cultivated hard-fiber plant which is grown in the Temperate Zone has led to an insistent demand for investigation to determine whether it may be grown profitably in the United States. The information obtained thus far shows that phormium is cultivated to only a very limited extent in New Zealand, most of the fiber being obtained from plants growing wild in reclaimed swamps. It has been introduced into nearly all warm or subtropical countries, but only on the island of St. Helena has the production of its fiber become an established industry, and in no place has it been found to grow in areas of commercial size as luxuriantly as it does in its native country. Several attempts by private individuals to cultivate phormium in this country have resulted in failure. These failures, however, together with the more successful growth of individual plants cultivated for ornament, have demonstrated that phormium requires a climate free from extremes of heat or cold, abundant moisture, and a fertile soil well supplied with humus.

Seeds of phormium have been secured from New Zealand, and young seedlings have been set out under conditions as nearly as may be found meeting the requirements of the plant.

YUCCA FIBERS.—An investigation has been made of the production of fiber from leaves of yucca plants growing abundantly over hundreds of square miles of unused lands from western Texas to southern California.

Fibers from palmilla (*Yucca elata*) in southern New Mexico and bear grass (*Yucca glauca*) in northeastern New Mexico and adjacent parts of Texas, Oklahoma, and Kansas have been used as emergency supplies to take the place of jute in the manufacture of cotton bagging.

Coarser fibers, more nearly like palma ixtle in character, are being prepared from the leaves of the blue yucca (*Yucca baccata*) of northern Arizona and eastern California, the green yucca (*Yucca mohavensis*), extending from the Mohave Desert of California to central Arizona, and the flowering yucca (*Hesperoyucca whipplei*), growing in the San Bernardino and Coast Range Mountains of California, to be used in the manufacture of binder twine.

The yucca plants now growing are sufficient to insure a supply of leaves for several years, but investigations are desired to determine the rapidity of growth, length of life, and the possibility of cultivating a permanent supply.

SOFT FIBERS FOR THREAD AND TWINE.

The severe reduction in foreign supplies of flax and hemp has resulted in increasing interest in the production of these fibers in the United States. The principal efforts of the Bureau of Plant Industry to encourage the cultivation of hemp and fiber flax in the United States have been directed toward the development of improved strains or varieties.

FLAX.—A large number of pedigree selections of fiber flax and also increase plats of the best varieties were grown at the experiment station at East Lansing, Mich., in 1918. These improved strains had been developed by four to eight generations of selection. A marked difference in resistance to lodging was shown by the different strains, and it was noted that some of the tallest and best strains were also lodge resistant.

In order to gain time in increasing the supply of seed of these improved strains some of the seed, after being harvested in Michigan, was taken to Porto Rico, where an increase crop was grown during the winter. The seed thus produced was brought back in the spring of 1919, in time for planting semicommercial tests in the fiber flax-growing regions in Michigan and Oregon. This flax is decidedly superior to the fiber flax grown from commercial seed of either recent or remote importation. The stocks of these improved strains are being increased as rapidly as possible.

Trial plats of fiber flax, ranging from one-tenth acre to 5 acres, are being grown in 12 localities in Wisconsin. Some of these plats are very promising, notwithstanding unfavorable weather conditions.

In addition to eastern Michigan and the Willamette Valley in Oregon, where the cultivation of fiber flax has become an established industry, this crop is being cultivated this season in western Washington, southeastern Minnesota, southern Wisconsin, and western

New York. The total area, about 5,000 acres, is slightly in excess of that of 1918.

HEMP.—The plats of pedigree seed hemp at the Arlington Farm made a record growth in 1918, two of the best varieties averaging 13 feet 5 inches and 12 feet 5 inches, respectively. More than 600 pounds of seed of these pedigree plants were sent out to commercial growers. Some of this was sown broadcast for fiber in order to compare it with commercial crops, but more than 300 acres were planted with this seed in checks for seed production, and this should yield enough for more than 4,000 acres of fiber hemp next year.

The second-generation hybrid Ferramington, combining the height and long internodes of Kymington with the earliness and heavy seed yield of Ferrara, gives promise of a good fiber type of hemp that may ripen seed as far north as Wisconsin.

A foreign market for American hemp is being developed, and for the first time in more than half a century commercial shipments of hemp grown in the United States are being sent to Europe.

Two important needs of the hemp industry in this country at the present time are an efficient system of water retting which will produce high-grade fiber like that imported from Italy and a satisfactory system of grading, so that both the producer and the manufacturer may know the quality of each bale of fiber.

FORAGE CROPS.

RHODE ISLAND BENT.

The preliminary tests of a new stripping machine to harvest the seed of Rhode Island bent were very satisfactory. Extensive tests will be conducted, and it is confidently believed that this machine will insure adequate market supplies of this seed, for which there is a large demand.

NAPIER GRASS.

Napier grass has created great enthusiasm equally in the extreme South and in California. In Florida it is more productive on sandy soils than any other grass yet found. The possibility of utilizing it as a pasture crop by grazing separate fields when the grass is 18 to 24 inches high is being tested; also the practicability of ensiling it when 6 to 8 feet high, two such crops being produced in a season. The mature stems are too fibrous to be satisfactory as feed.

SEEKING NEW CROP PLANTS ABROAD.

The search for new crops in foreign countries was continued during the year. This work was necessarily curtailed on account of war conditions. Explorations in Ecuador resulted in securing something like 50 new plant immigrants, among which are two avocados from a high altitude which may prove cold resistant. Through foreign correspondence something like 1,000 new plant immigrants were introduced. The search for new and promising crop plants was continued in a limited way in China and Japan.

NEW AVOCADOS FROM GUATEMALA.

Twenty-three new and promising avocados have been secured from Guatemala. More than 4,000 of these have been propagated, freed

from dangerous insects and diseases, and distributed for tests in Florida, California, Hawaii, Porto Rico, and Cuba. The varieties introduced should have a wide range, as they represent types coming from near sea level up to an altitude of more than 5,000 feet.

BAMBOO AS A CROP FOR THE SOUTH.

Sufficient progress has been made in the growing and testing of bamboos to show that we now have six or seven types suitable for a wide range of soil and climate and useful for a great variety of purposes. A type suitable to the warmer parts of the United States has been found useful in the manufacture of several kinds of brushes and brooms. A valuable edible type has been obtained and is being propagated. Two of the types adapted to a wide range of soil and climate have been found useful in the manufacture of fancy fishing poles and phonograph needles. Prior to the war, large importations of canes were made from the Orient for these purposes. The greatest use for the bamboo in the South will, it is believed, come from home utilization for water pipes, poultry-yard fences, poultry protection, light fences and gates, simple types of home furniture, outbuildings, etc. Bamboos are being propagated extensively with a view to inaugurating plantings and making tests through cooperation with boys' and girls' pig and poultry clubs in the South.

NEW OR RARE FORAGE CROPS.

Something like 1,200 bushels of new and rare soy-bean seed were grown for special distribution. The Hahto soy bean, introduced in 1915, has proved a most useful food and forage crop. An extensive distribution of this bean has been made in order that it may be given a thorough trial.

NEW STOCKS FOR AMERICAN FRUIT GROWERS.

One of the big problems of American fruit growing is that of stocks resistant to diseases and insects and suitable for our wide range of soil and climate. Promising new stocks of pear, apple, peach, cherry, and plum have been assembled from foreign countries, chiefly the Orient. Nearly 150 pounds of seed from pear trees supposed to be resistant to fire-blight have been secured through exploration in China. Seedling stocks are being grown at widely separated places, and distributions are being made to nurserymen and others in order to determine their disease resistance, congeniality, and adaptability to varying soils and climates. About 75,000 new pear stocks have been distributed.

BLIGHT-RESISTANT CHESTNUT TREES.

The Chinese chestnut (*Castanea mollissima*) has been found one of the most promising trees to combat disease. This chestnut was found in China, where for years the trees had to struggle against blight. Several thousands of these young trees are now being grown, also several thousand hybrid chestnuts, with the object of testing them for disease resistance and nut production.

PROMISING NEW VEGETABLE CROPS.

The dasheen continues to offer encouraging possibilities as a food crop for the South. Special attention was given to the marketing of this crop during the year. Nearly all the dasheens were marketed in northern and eastern cities, the price ranging from 12½ to 20 cents per pound. Seed tubers were supplied to about 1,700 collaborating experimenters. The production at one station on 3 acres was 850 bushels, or something over 50,000 pounds.

The chayote, another vegetable, gives promise of success. Nearly 750 bushels of this crop were produced at two stations, and 1,075 packages were sent to home demonstration agents in the South and to cooking schools. Something over 1,700 packages of seed chayotes were sent to persons in the South Atlantic and Gulf States who wish to grow the vegetable experimentally.

The arracacia, a staple vegetable of the Venezuelans, is another promising vegetable for the Southern States.

PROTECTING NEW PLANT INTRODUCTIONS.

So many dangerous and destructive crop enemies have been brought into this country that public sentiment has demanded more thorough protection. Very rigid protective measures have been adopted in connection with all plant-introduction work conducted by the Bureau of Plant Industry. Not only is every safeguard taken to prevent dangerous enemies from coming in on plant immigrants, but every precaution is observed in freeing our own seeds and plants which we send to foreign countries from many potential enemies that might be injurious in their new homes. Cooperating with the Federal Horticultural Board, intensive inspection is made of all seeds and plants coming from foreign countries and all seeds and plants distributed from our stations but originally coming from abroad. Between 3,500 and 4,000 lots of seeds and plants coming into the country and going out of the country were examined the past year. The increase in this work under the new Quarantine Order No. 37, issued by the Federal Horticultural Board, has made it necessary to broaden its scope. To this end a new plant-detention station is being established near the city of Washington. This station will have for its primary object the receiving and growing of new plant immigrants with a view to removing all possible chances of introducing dangerous diseases and insect enemies.

CROP UTILIZATION.**DRUG-PLANT INVESTIGATIONS.**

Notwithstanding the prevailing high market prices of crude botanical drugs, the period covered by the past fiscal year has been a critical one as affecting drug-plant culture in this country, because of shortage of labor and unexpected difficulties encountered by many who engaged in the enterprise without the experience or knowledge necessary to carry on the work successfully. The net result is seen in the abandonment of the work by a large number of the smaller growers, leaving the field to those who have been reasonably successful, either through favorable location or better equipment, from

the standpoint of facilities for handling special crops and business organization for marketing the products. The Bureau of Plant Industry has continued its efforts to assist both in the permanent development of this industry along practical lines and in saving waste and unproductive effort in directions likely to result in failure.

Continued interest is manifested in the development of drug gardens at schools of pharmacy throughout the country, and in a number of instances material assistance has been rendered in connection with the establishment of new gardens by furnishing plans, supplying seeds, roots, and plants for propagation, and giving desired information with respect to suitable selections for the available situation and general methods of culture and handling. This feature of the development of drug-plant culture affords improved facilities for instruction in the characteristics and properties of medicinal plants, and further is calculated to conserve propagating stock of important medicinal plants in this country and disseminate practical knowledge concerning drug-plant growing and handling.

THE CAMPHOR INDUSTRY.

The high price of camphor and the difficulty of obtaining adequate supplies from the native sources of production have greatly stimulated interest in the development of the camphor industry in Florida. Through an informal cooperation with the large camphor growers systematic observations have been continued on improved methods of growing and handling the crop in the field. An intensive study of the process of distillation revealed sources of loss, and refinements in the methods of recovery were devised by which the percentage of camphor recovered from the distilled material is very substantially increased. Extended experimentation on methods of propagating and transplanting camphor seedlings has resulted in a substantial reduction in the cost of these operations on a large acreage basis.

UTILIZATION OF AGRICULTURAL WASTE PRODUCTS.

Studies of waste materials of the canning and fruit-packing industries have been continued with reference to the economic possibilities in the recovery of valuable commercial products from these sources. Investigations of the utilization of tomato-cannery waste on a commercial scale have been brought to satisfactory completion. Similar studies during the year have included the investigation of the possibilities in the utilization of waste grape pomace, pumpkin seed, and corn waste from canneries, and the sirup content of the stalks remaining after the harvest of sweet corn.

CROP UTILIZATION IN IRRIGATED REGIONS.

In newly developed irrigated regions there is a continuing and urgent demand for information as to the best varieties of field crops for each locality and the best methods of culture, as well as of methods of crop utilization.

The economic importance of utilizing bulky forage crops at the point of production through the use of live stock has been fully recognized, and arrangements have been made for demonstrating at the irrigated field stations the most efficient methods of using such crops. Extensive demonstrations have been carried on in pasturing

crops, the production of silage crops, the utilization of by-products, and in supplementing pasture crops with grain for the production of meat and milk. Some attention has also been given to the use of sheep on irrigated farms, and some of the possibilities of using these animals for consuming waste products and cleaning up fields and ditch banks have been demonstrated.

INVESTIGATIONS OF SEED SUPPLIES.

ENFORCEMENT OF THE SEED-IMPORTATION ACT.

During the past year comparatively few lots of seed have been offered for entry which did not comply with the requirements of the Seed-Importation Act. The most striking exceptions have been certain lots of Canadian alsike-clover screenings which have been imported for the purpose of recleaning.

Of those seeds covered by the act the importations during the fiscal year 1919 have been few as compared with 1917 and the preceding year, with the exception of alsike clover, of which 7 million pounds were imported, as compared with $3\frac{1}{2}$ million pounds last year and $4\frac{1}{4}$ million pounds the previous year, these three years being those of largest importation of this kind of seed. It is evident that practically this entire quantity of alsike-clover seed was put into consumption, so there will be little, if any, carry-over of the seed imported during the fiscal year.

There was a remarkable falling off in the quantity of rapeseed imported—639,000 pounds this year as compared with more than $11\frac{1}{4}$ million pounds last year, both years' importations coming principally from Japan.

SEED TESTING.

During the year, 18,820 samples of seed were received for test at the Washington laboratory and 10,252 at the five branch laboratories maintained in cooperation with State institutions.

LABELING FIELD SEEDS.

Following a conference with seedsmen in the summer of 1917, representatives of the seed-trade associations and a large number of individual seedsmen agreed to label all lots of field and forage-crop seeds sold in quantities of 10 pounds or more with the percentage of pure live seed, the date of the germination test, and in certain cases the country of origin. In the spring of 1918, seeds of redtop and red clover were purchased and examined to determine to what extent this agreement was kept. This examination showed that only 10 per cent of the lots of seeds purchased were found to be fully labeled in accordance with the agreement.

Practically all of the larger seed dealers now have facilities for testing seeds and know the quality of the seeds they are handling, but apparently most of them are not passing on to the farmer this information, which is of vital importance to him.

CRIMSON CLOVER.

A series of trials designed to be carried on for five years has been begun to determine whether French or domestic crimson-clover seed is best for this country. These trials are being made in coopera-

tion with the Delaware and North Carolina agricultural experiment stations. The seed used comes from France, Italy, Delaware, and Tennessee.

In connection with the development of the crimson-clover seed-growing industry in south-central Tennessee, a preliminary study has been made of the problems and it has been found that harvesting is the most important one connected with this project. The tendency of the growers is to harvest a little too early, so as to prevent loss by shattering. This results in harvesting a great deal of shrunken immature seed. Work must be done to determine whether harvesters can be used that will permit the clover to stand until thoroughly mature.

COTTON.

The selection and the distribution of superior varieties of cotton are being continued, with special attention to the problem of developing and maintaining adequate supplies of pure seed in order to extend the commercial production of these varieties in the different regions of the cotton belt. The largest volume of production has been attained with the Lone Star variety, now estimated at above 1,000,000 acres. This variety represents the Texas Big-Boll type, having the good qualities of Triumph and Rowden with larger bolls and lint of better quality, that under normal market conditions commands a distinct premium over ordinary short cotton. The Lone Star variety has been distributed eastward from Texas, with the advance of the boll weevil, and has become popular in many Upland districts. An organized production of larger quantities of pure Lone Star seed is being developed in northern Texas, with a cotton-breeding station at Greenville, Hunt County, serving as a center for cooperation with local communities.

The Trice cotton has become widely known, being an extra-early variety, unusually productive, and having larger bolls and better lint than other short-season kinds. It is grown especially along the northern rim of the cotton belt. For dry weather and short-season conditions in Oklahoma and Texas a variety recently acclimatized from southern Mexico is being grown extensively under the name of Acala.

Several long-staple Upland varieties have been bred or acclimatized and distributed by the Bureau of Plant Industry and grown in commercial quantities, the Columbia (or Webber) in South Carolina and adjacent States, the Foster in Louisiana and the Red River Valley of Texas, and the Durango in the Imperial Valley of California, the Pecos Valley of New Mexico and Texas, and also in Alabama and South Carolina and in southeastern Virginia. Another new type called Kekchi, introduced from Guatemala several years ago but not yet distributed, has attained local popularity in northern Texas, around Clarksville.

Between two and three thousand acres of Meade cotton are being grown this season in the Sea Island district of Georgia and Florida. This variety seems likely to replace entirely the mainland crop of Sea Island cotton as soon as the seed can be multiplied in sufficient quantity. The production of pure Meade seed is still inadequate to meet the demands, since it has been demonstrated that the variety

is not only as early as most of the short-staple varieties, but yields well and produces a fiber that is received on the markets on a par with Sea Island cotton; in fact, many bales of Meade have commanded a premium over Sea Island. The supply of pure seed for planting purposes is being rapidly increased, due to the cooperation of many growers who have appreciated the necessity for isolation and clean ginning. It has been found, however, that many growers and ginners do not appreciate the necessity for pure seed, and quantities of mixed seed have been sold and planted. Should this process continue, the reputation of the Meade variety for uniformity may suffer on account of the distribution of these mixed stocks. An organization of Meade growers in cooperation with the Bureau of Plant Industry is endeavoring to have all mixed stocks replaced with pure seed, and with a definite recognition of the need of continued selection and isolation to maintain the purity and uniformity of the stock it is hoped that the necessary precautions may be taken.

The most striking example of introducing a new type of cotton, establishing a new industry, and maintaining an adequate supply of good seed is in connection with the Pima variety of Egyptian cotton in the Salt River Valley of Arizona. Nearly 100,000 acres of pure Pima cotton were planted in the spring of 1919 in the irrigated districts of the Southwestern States. This scale of production of superior fiber has become possible through the establishment of a central supply of pure seed, 1,250 tons being furnished for planting in 1919 from a single community center around Tempe, Ariz., where no other variety is grown.

Cooperation with the Pima cotton growers in maintaining the purity of their planting seed was continued by roguing the seed-increase fields and removing the off-type plants. This work gives an exceptional opportunity for thorough study of the commercial seed stock of this variety and for detecting the first indication of deterioration, if this should occur. No evidence has yet been obtained of any loss of uniformity in this variety. The measures taken by the Bureau of Plant Industry, ably seconded by a growers' association in the Salt River Valley, have successfully protected this exceptionally uniform cotton from mixing or crossing with any other variety.

Pima cotton is now the only very long staple variety (with fiber $1\frac{1}{2}$ to $1\frac{3}{4}$ inches long) grown in the United States of which a large supply of even-running fiber is obtainable. Approximately 35,000 bales were produced in Arizona and California in the calendar year 1918. The demand for this variety since Sea Island cotton production has been curtailed by the boll weevil has exceeded the supply. This cotton is most extensively used in high-grade automobile-tire fabrics and appears to be a satisfactory substitute for Sea Island in most goods for which that cotton is used.

A serious problem of cotton farming in dry regions or where dry weather occurs at the planting season is to obtain regular germination of seed and a full stand of plants in the rows. Germination may be prevented by dry soil or by planting too deep. Experiments conducted in Arizona and Texas have shown that much better stands can be secured by a lister attached to the shoe of the planter, which makes it possible to place the seed in moist soil at a uniform depth.

CONGRESSIONAL SEED DISTRIBUTION.

During the fiscal year 1919 there were distributed on congressional and miscellaneous requests 8,072,791 packages of vegetable seed, and 883,136 packages of flower seed, or a total of 8,955,927 packages, each containing five packets of different kinds of seed. There were also distributed 12,122 packages of lawn-grass seed, and 10,368 packages of imported narcissus and tulip bulbs. The seeds and bulbs were purchased on competitive bids, as heretofore. Each lot of seed purchased was thoroughly tested for purity and viability before acceptance by the Bureau of Plant Industry, and tests of each lot of seed were conducted on the trial grounds of the Department of Agriculture to determine its trueness to type.

NEW AND RARE FIELD-SEED DISTRIBUTION.

A distribution of new and rare field seeds was made throughout the entire United States, having for its object the dissemination of seed of new and rare field crops, seed of improved strains of staple crops, and high-grade seed of crops new to sections where the data of the Department of Agriculture indicate such crops to be of considerable promise. Each package contained a sufficient quantity of seed for a satisfactory field trial, and the recipient was urged to use the seed, if feasible, for the production of stocks for future plantings. A report card and a circular giving full directions for the culture of the crop accompanied each package of seed.

Only seed of new crops or of improved strains of standard crops were distributed, including the following: Dakota-grown, Grimm, Kansas-grown, and Peruvian alfalfas; Great Northern field beans; yellow and white sweet clovers; Brabham, Groit, and Early Buff cowpeas; feterita; Bangalia, Carleton, Gregory, and Paragon field peas; Natal grass, orchard grass, and Rhodes grass; Dwarf Black-hull kafir; Turkestan, Golden, and Kursk millet; Dwarf Yellow milo; Freed, Dakota Amber, Red Amber, and Sumac sorghums; Biloxi, Black Eyebrow, Haberlandt, Ito San, Mammoth Yellow, Manchu, Peking, Tokyo, Virginia, Wilson, and Wilson-Five varieties of soy beans; Sudan grass; Alabama, Bush, Georgia, and Osceola velvet beans; purple, narrow-leaved, and woolly-podded vetch; and the Acala, Columbia, Dixie, Durango, Holdon, Lone Star, Meade, and Trice varieties of cotton.

During the year 139,441 packages of new and rare forage-crop seeds and 30,701 packages of cotton seed, or a total of 220,142 packages, were distributed. Gratifying results were obtained, indicating that by enabling a farmer to procure seed of new and improved crops in sufficient quantity to produce stocks for future seeding the crops of the country are gradually improved.

SOIL-FERTILITY INVESTIGATIONS.

FERTILIZER STUDIES IN THE FIELD.

Field studies have been continued and much extended during the year, and the results obtained have been particularly timely, in view of the fact that the war has upset the normal fertilizer composition and practice with regard both to nitrogen carriers and to potash

carriers. Field experiments have been conducted on the Washburn and Caribou silt loam in Maine; on the Sassafras silt loam on Long Island and in New Jersey; on the Penn loam in New Jersey; on the Hagerstown loam in Pennsylvania; on the Norfolk fine sandy loam in Virginia, North Carolina, South Carolina, and Florida; on the Norfolk sandy loam in Florida and the Norfolk coarse sandy loam in South Carolina; on the Portsmouth sandy loam in South Carolina; on the Coxville fine sandy loam in South Carolina; on the Orangeburg sandy loam in Georgia; on the Pope fine sandy loam in Arkansas; on the Greenville sandy loam in Georgia; on the Susquehanna fine sandy loam in Georgia; on the Scottsburg sandy loam in Indiana; and on the Superior silty clay loam at Ashland, Wis.

In the plan of experimentation followed there are being determined the best ratios of the plant-food constituents in the fertilizer mixture suited to the respective soils, the amount of these fertilizers giving the most profitable returns, and the availability of the various carriers for phosphate, potash, and nitrogen in the fertilizing materials commonly employed, as well as those which have been introduced during the war.

The American sources of potash studied are the salts from the Nebraska lakes, which are principally carbonates; the salts from the California borax lakes, which are principally muriates; the product from alunite mined in Utah, which is a high-grade sulphate of potash; ground kelp from the Pacific coast, tobacco stems, beet-waste potash, and several potash materials collected as dust from the cement mills. The sources of nitrogen studied are sodium nitrate, ammonium sulphate, dried blood, cottonseed meal, and cyanamid, a nitrogen-fixation product now used in fertilizers. The experiments are showing that these different materials have different economic importance, depending upon the soil and crop.

The crops grown in these fertilizer tests are those of greatest interest or economic importance to the region studied and include potatoes, cotton, corn, citrus fruits, pecans, sorghum, clover, celery, etc. These experiments are carried on cooperatively with the State agricultural experiment stations and other local associations and also with various offices of the department. The results obtained are being collected for a comprehensive study of these different soil types, but they are already yielding valuable results for local application as to the fertilizers best suited for particular regions and are also furnishing information to the farmers as to the various nitrogen and potash carriers most likely to produce the best returns in practice.

STUDIES OF THE MALNUTRITION OF CROP PLANTS.

The study of the malnutrition of certain plants, most notably of potato and cotton, which became particularly emphasized during the war, has been continued, and further facts regarding the distribution of these diseases and their relation to soil types, systems of agricultural practice, and fertilizers used have been determined. New and untried fertilizing materials are sometimes responsible for these troubles, but more often they have been due to an unbalanced condition in the fertilizers, due to too great an increase in one of the ingredients, with often total elimination of another. This in some regions has produced the so-called potash hunger of the potato plant,

to which considerable loss in the crop along the Atlantic coast can be ascribed. This unbalanced condition of the fertilizer shows itself most markedly on the low-lying soil regions of the East and on the sandier types of soil. A similar condition has shown itself along the Atlantic seaboard with the so-called cotton rust, which is a malnutrition disturbance caused by an unbalanced condition of the fertilizer used or by the unbalanced condition of the normal soil nutrient solution as found in many of the sandier soils of the Coastal Plain. The experiments show quite definitely that this condition is associated with the fertilizer practice and that potash salts will correct this difficulty and prevent the collapse of the plant.

To a certain extent last season and quite prominently this spring some further difficulties in fertilizer usage have arisen in connection with the reappearance of higher potash contents in fertilizers. This subject has been under investigation in connection with our tests on various potash sources now used in fertilizer practice, and the difficulty referred to appears to be due to a disturbance of the normal growth of the plants by the presence of borax in the potash-carrying fertilizers. Such fertilizers, it would seem, should be used only under such restrictions as will make it certain that harmful quantities of borax will not be introduced into the soil. The loss from this fertilizer disturbance this year is estimated to be considerable, especially when large quantities of a potash fertilizer are used, particularly with potatoes, cotton, and tobacco.

FERTILIZER TESTS OF UNUSUAL MATERIALS.

The war conditions have brought forth a very considerable number of substitutes for the usual and normal fertilizer ingredients, some of which are in the hands of various strongly organized concerns, but which are nevertheless of doubtful value. Quite a number of these products have been tested, both in the greenhouse and in the field, where either their worthless character or their proper value has been shown.

BIOCHEMICAL INVESTIGATIONS.

Scientific inquiries into the fundamental factors underlying soil fertility and plant nutrition have been continued and with the cessation of war work have developed at an increasing rate. Among these is the relation of certain plant diseases to the hydrogen-ion concentration of the soil; the study of the chlorophyll changes which occur in the case of malnutrition of the potato and cotton plants; the causes of certain chlorosis phenomena in plants under adverse soil conditions; the relationship of the composition of the crop to the fertilizers used; and the relationship of the soil in general to the prevalence of plant diseases and the physiological condition of the crop. There is in process also a study of the composition of the plant in certain constituents, such as proteins, carbohydrates, and fats, in relation to the fertilizer used.

UTILIZATION OF EXCESS WAR MATERIALS FOR FERTILIZER.

Since the close of the war an investigation into the use of deteriorated cannon powder and smokeless powder has been begun at the request of the War Department and in cooperation with the National

Research Council, with a view to utilizing economically such materials in fertilizer practice.

The investigation has already shown that trinitrotoluene is poisonous to plants and can not be directly used in fertilizers; that the nitrated celluloses, while not poisonous to plants, are, on the other hand, so insoluble as to leave the nitrogen unavailable to plants, and that ammonification or nitrification of this material in the soil proceeds with extreme slowness, if at all, under normal conditions. Chemical treatment of this material is therefore being resorted to, and already some very promising results have been obtained, which make the nitrogen of such materials available and would appear to be the basis for the possible utilization of such material in fertilizers.

FERTILIZER TESTS ON TOBACCO.

In Maryland a series of fertilizer tests with tobacco which has been in progress for several years was completed, and the results have been published in popular form. It has been found that on the average soil nitrogen is the fertilizer element most needed by the tobacco crop. Phosphoric acid has not increased the yield, but may improve the quality of the tobacco. Under systems of heavy or continuous cropping the tobacco has shown a decided need of potash. Under average conditions a fertilizer supplying 25 to 30 pounds each of nitrogen and potash and about 50 pounds of phosphoric acid per acre will give very profitable returns. The commercial fertilizers commonly used by tobacco growers do not furnish enough nitrogen for the best results. Field tests dealing with the fertilizer requirements of the principal types of tobacco were continued in the States of New York, Pennsylvania, West Virginia, Virginia, and the Carolinas.

Substantial progress has been made in an investigation of the rôle of potash in the nutrition of the tobacco plant, including the comparative effects of the muriate and sulphate on the growth and development of the plant. It has been established that there are material differences in the action of these two forms of potash when applied as a fertilizer to tobacco on certain types of soil.

PLANT-NUTRITION INVESTIGATIONS.

In the field experiments dealing with the specific effects of crop plants on the yields of crops immediately following, many data have been secured tending to show that under strictly comparable conditions corn, tobacco, and potatoes affect very differently the yields of succeeding crops of wheat, oats, and rye. These effects are manifested under different fertilizer treatments, but in varying degrees. The crops of corn, tobacco, and potatoes also show similar results when each crop is grown after itself and in rotation with the other two.

In connection with further investigations on the relation of the environmental conditions to the formation of oil in the seeds of plants it has been discovered that, contrary to general belief, sunlight, rather than temperature relations, is the important factor in determining the seasonal development or maturation of plants. This discovery of a comparatively simple connection between sunlight and the vegetative and reproductive phases of plant development un-

doubtedly will throw much light on the relationships between early and late maturing varieties and species and their natural distribution.

PLANT PHYSIOLOGICAL INVESTIGATIONS.

Evidence has accumulated that a low water requirement, although an important factor in comparative resistance to drought, is by no means the only factor involved. The water requirement has now been determined for practically all important species and varieties of field crops, and the data obtained during the past several years make it possible to answer decisively the question to what degree water requirement is correlated with adaptability to drought conditions. Attention was focused during the past year upon the increase and distribution, in cooperation with the congressional seed distribution, of improved strains of sorgo and millet adapted to conditions in the northern Great Plains region. Drought-resistance breeding work with other forage plants, especially alfalfa and smooth brome-grass, was continued, and promising strains of the two crops mentioned are being increased for distribution to farmers in the central and northern Great Plains.

CEREAL PATHOLOGY.

BLACK OR STEM RUST.

BLACK-RUST EPIDEMICS.—An intensive nation-wide investigation of black rust has been made during the year. Special attention has been given to the factors which may contribute to epidemics of this rust. Among these factors are weather conditions, soil drainage, air drainage, barberry bushes, the winter hardiness of the urediniospores, or red stage, and of the teliospores, or black stage, and the carrying of spores by the wind.

In the investigation of the overwintering of the black rust it has been found that survival varies with the severity of the winter. In average years very few of the red spores, which start the rust directly on wheat in the spring, are able to survive winter conditions north of about latitude 35° N. South of this general latitude, however, they were able to overwinter abundantly. In the exceptionally mild winter of 1918-19 they survived as far north as Wisconsin. On the other hand, the black spores, which start the rust on barberry bushes, normally live through even the severe winters of our most northern States and start the rust in the spring. They can not start the rust directly on wheat, however, so that destroying common barberries makes these spores harmless. A thorough investigation of the infection of wheat seed by black rust has been completed. The study has covered several years and involved the growing of many thousands of plants from rust-infected seed; no infection of seedlings from such infected seed has been produced.

Varieties of wheat almost completely resistant to some of the biological forms of black rust have been discovered or developed by breeding and are being used in other breeding experiments in cooperation with the agricultural experiment stations of Minnesota and Kansas.

BARBERRY ERADICATION.—The campaign for the control of the black rust of wheat through the eradication of the common barberry is in

active operation in thirteen North-Central States, namely, Colorado, Illinois, Indiana, Iowa, Michigan, Minnesota, Montana, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin, and Wyoming. State laws requiring the removal of common barberry bushes have been enacted in all these States except Indiana, Ohio, and Wyoming. The campaign has been conducted in each State by widespread publicity through many channels.

The first problem, naturally, is to locate all bushes resulting from intentional planting and induce their owners to remove them.

The second, and perhaps the most difficult problem in the campaign, is to locate bushes running wild. The number of localities in which wild bushes are found is immensely larger than was believed at the beginning of the campaign. Through many decades since barberries were first planted in these States, the seeds have been sown in large numbers in thickets and woodlands by wild birds. The difficulty of locating such bushes in rough and broken timberland, oftentimes amid thickets and underbrush, will be appreciated by anyone who undertakes it. It is essential, however, that such bushes be located and removed. In most cases they are not far distant from grainfields, and in any case rust spreads readily from them to grainfields by way of wild grasses in their vicinity. Furthermore, if they remain undisturbed their numbers will continue to increase by the action of birds throughout the years to come.

The third problem is to insure that every bush located is removed by the owner or agent, and so thoroughly and completely removed that sprouts will not develop, or, failing this, to insure that sprouts which do appear will be destroyed.

Already the number of bushes located and destroyed runs into the millions. More than half a million have been destroyed by nurserymen in a single State. Naturally, as the campaign progresses the number of bushes located each month becomes smaller. However, they are still being found by the tens and hundreds of thousands. From March to July, 1919, inclusive, more than 16,000 bushes were located in Illinois. Nearly 40,000 were located in Iowa during the spring and early summer of this year. Up to May 30, 1919, Nebraska had found 63,000 bushes. About 91,000 plants have been removed from private premises in Wisconsin, in addition to large numbers taken out of public grounds. No serious outbreak of black stem rust occurred this season, although many bushes undoubtedly remain undiscovered.

LEAF RUSTS OF WHEAT, BARLEY, AND RYE.

A leaf-rust survey and investigation of epidemiology have shown the leaf rusts, and particularly the leaf rust of wheat, to be of far greater importance as limiting factors in grain production than had been supposed. In some sections of the South Atlantic coast the damage due to the leaf rust of wheat was so serious as to ruin the crop. In the States growing hard winter wheats extensively, such as Kansas, Nebraska, and Oklahoma, leaf rust was almost epidemic this season.

Field, greenhouse, and laboratory investigations of the leaf rusts of wheat, barley, and rye have been carried on in cooperation with

the Indiana Agricultural Experiment Station. Special studies to discover biologic forms of leaf rusts have so far given negative results. Considerable progress has been made in determining the hosts and host relationships of the several leaf rusts, and many data have been obtained on factors influencing the development of epidemics. Investigations have shown that the leaf rusts of wheat and rye can overwinter in the urediniospore stage, even in the severe northern winters.

One of the most important discoveries in the history of rust investigations in this country has been made in cooperation with the Agricultural Experiment Station of Kansas. The three Kansas wheat selections of the Crimean group—Kanred (P-726), P-1066, and P 1068—which previously were known to be resistant to the most seriously destructive biologic form of black rust, here proved to be highly resistant also to leaf rust.

FUSARIUM ROTS OF CORN AND THE SCAB OF WHEAT AND OTHER CEREALS.

Investigations show that the *Fusarium* rots of corn live through the winter both in the soil and in and on the seed. They attack the corn crop at several different stages and in several different ways, as follows: (1) By preventing germination in laboratory and field; (2) by causing a weak germination in the germinator and in the field; (3) by blighting and destroying the seedlings; (4) by dwarfing the seedlings so much that they develop only barren stalks or stalks with small and sometimes almost worthless ears; and (5) by rotting the root systems, or the stalks and ear shanks, resulting in stalks easily blown over by wind, in broken stalks, broken ear shanks, and the rotting of the ears themselves in varying degree. Some of the diseased plants ripen prematurely. Because of this early ripening, the ears from such plants frequently are selected for seed. Diseased stalks may bear undiseased ears, but usually plants grown from such ears are highly susceptible to attacks from the *Fusarium* rot fungi in the soil or elsewhere. The diseased ears can be largely excluded from seed corn by carefully selecting well-matured ears on healthy plants in the field and by special study of such seed on the germinator. Preliminary experiments show that by rejecting diseased ears the yields of corn may be materially increased, possibly as much as 10 or 15 or even 20 per cent in portions of the corn belt.

SIX SPECIES OF FUNGI MAKING THE PROBLEM COMPLEX.—Investigations to date indicate that there are at least six species and varieties of fungi which cause rots of corn, and one of these also causes scab, or blight, of wheat and other cereals. There are two important sources of infection for both corn and wheat—infected seed and old infected cornstalks; there may be still other sources of infection of wheat not yet determined.

TAKE-ALL AND FLAG SMUT OF WHEAT.

In April, 1919, the attention of the Bureau of Plant Industry was called to a serious outbreak of disease in the wheat fields of Madison County, Ill. Prompt investigation discovered a disease very similar to take-all, a very destructive disease of wheat in Australia and other parts of the Orient, as well as in some countries of Europe.

A few days later flag smut, a destructive disease of wheat in Australia, was discovered in wheat fields in the same county, and in some cases in the same fields as take-all. Pathologists of most of the wheat-producing States, together with a number from the United States Department of Agriculture, were immediately called together in Illinois in order to become personally familiar with these two diseases in the field. A survey of wheat fields, not only in Illinois but in many other States, was begun at once so as to determine whether one or both these diseases had become established elsewhere in this country. This survey resulted in the discovery of rather extensive infection in Madison County, Ill., with less extensive infection in two other counties in that State and in three counties in Indiana.

In cooperation with the Federal Horticultural Board and the authorities of Illinois and Indiana, action has been taken designed to prevent the spread of these two diseases and finally to eradicate them, if possible. The State officials have established quarantine areas, including the infested fields and the fields which surround them.

THE NEMATODE OR EELWORM DISEASE OF WHEAT.

The nematode disease of wheat has been found in Maryland, Virginia, West Virginia, and Georgia and has done considerable local damage. Investigation has shown that the disease attacks rye virulently; also oats, emmer, and spelt to some extent. Experiments have shown conclusively that the nematodes live over winter in the soil.

A wheat crop may become infected either from the seed or from the soil. To escape infestation, fields should be sown with seed wheat free from nematodes. Such seed wheat may be obtained either from uninfested fields or by treating wheat infested with nematode galls with a 20 to 25 per cent salt solution. In this brine the sound wheat will sink and the nematode galls will float, when they can be removed and destroyed. Experiments show conclusively that sowing seed wheat containing nematode galls without such treatment results in a heavily infected crop. Sowing clean seed wheat on infested soil also results in a serious infection of the crop, but clean seed wheat sown on clean land gives a clean crop, even though adjacent to infested fields.

CONTROL OF CEREAL SMUTS.

In the fall of 1917 a campaign was started, in cooperation with the extension services of the cereal-growing States, for the prevention of cereal smuts controllable by seed treatment. This work was continued throughout the fiscal year 1919. Demonstrations of methods of seed treatment were held in 28 States, a large number being given in each State. Departmental field assistants addressed groups of farmers and showed them the details of the methods of seed treatment. As a result there was a great increase in the quantity of seed grain treated in the last two years. Fully 25 per cent more farmers treated seed for the 1918 crop than for the crop of 1917. The results for the crop of 1919 are not yet compiled, but it is estimated that a still larger increase took place in the percentage of seed treated.

BLACK-CHAFF OF WHEAT.

Studies on the biology of the bacterial organism causing the black-chaff of wheat have continued, and numerous field observations were made on its distribution. It occurs in many places in Iowa, Kansas, Nebraska, and the neighboring States. This trouble is transmitted on the seed wheat, and wherever it is possible farmers are urged to procure seed wheat from fields which have not shown the disease.

A method of control by means of seed treatment has been discovered, which works remarkably well in the laboratory, greenhouse, and experimental plat, but is yet to be tried on a large scale under field conditions in the Middle West. This treatment consists in soaking the infected seed (after proper screening) for 10 minutes in formalin diluted with water in the proportion of 1 part to 400 parts of water. The former objection to the use of formalin, that either it did not kill all the surface organisms or else that it destroyed also a considerable portion of the seed, has been overcome by causing the seeds to absorb considerable water in advance of treatment. By giving the seed wheat a preliminary water bath for 10 minutes, after which it is drained and kept moist (covered) for six hours, the seeds absorb about 30 per cent of water and become much more resistant to the germicide. They are then plunged for 10 minutes into the formalin water, drained, and are kept moist (covered) for another six hours in order to secure the full surface effect of the small amount of formaldehyde vapor remaining. They are then spread out thinly to dry and should be sowed the next day.

CROP DISEASES.**POTATO DISEASES.**

The investigations of potato mosaic, extending over several years, have yielded particularly valuable results during the past season in the way of proof of the means of dissemination of this disease and the possibilities of control through the roguing of seed plats. It has been shown that the mosaic is transmitted through stem grafts and tuber grafts, through transference of the plant juices mechanically, and by aphids. The establishment of these facts is an important step toward the working out of control measures for this disease.

Following the discovery in the fall of 1918 of the potato wart in the mining districts in the vicinity of Hazelton, Pa., the investigations already in progress were extended and enlarged. In cooperation with the Federal Horticultural Board and the Pennsylvania authorities a careful survey was made of the territory contiguous to the point where the wart was first discovered, and many gardens were found to be infested. A laboratory for the investigation of the disease has been established at Freeland, Pa., in cooperation with the Pennsylvania Department of Agriculture and the State Agricultural Experiment Station.

The studies of potato leaf-roll during the past year have included observations of the symptoms of this disease under varying conditions throughout the country. Our knowledge of this disease has been further increased through the results of comparative studies of the anatomy of healthy plants and those infected with leaf-roll.

WATERMELON DISEASES.

During the past season a special effort has been made to educate the southern grower in the methods of controlling the two most serious diseases of watermelons, anthracnose and stem-end rot. The Melon Distributors' Association, the United States Railroad Administration, and the State extension departments cooperated in this work. A field campaign was carried out, through which the methods for the control of these diseases were brought to the attention of the public by means of posters, printed cards, bulletins, and lantern slides. In the case of stem-end rot an effort was made to secure the stem treatment with disinfectant paste of all melons shipped from Georgia, Florida, South Carolina, and Alabama, the four States which have suffered most from this disease in the past. It is estimated that in 1918 more than 2,500 carloads of watermelons, almost 20 per cent of the total shipments from these four States, rotted in transit, the chief trouble being stem-end decay. The results to date of the inspection of cars treated this season show that the loss in these cars has been reduced to less than 1 per cent. A very general application of the stem treatment has been made possible by the fact that the United States Railroad Administration required the prepayment of the freight on untreated carloads.

Spraying for the control of watermelon anthracnose was also carried out this season under the supervision of our field assistants on approximately 3,400 acres of melons in Florida with satisfactory results. Tests of the practicability of seed treatment on a commercial scale for the control of watermelon anthracnose are being made on areas comprising about 2,000 acres in Indiana, Missouri, and Arkansas which have been planted with seed disinfected with mercuric chlorid.

CUCUMBER DISEASES.

The investigation of cucumber diseases, extending over several seasons, has yielded important results within the past year. Three of the most destructive and widespread diseases, mosaic, anthracnose, and angular leaf-spot, have received major attention. A prominent development in the study of the mosaic disease has been the discovery of a method of overwintering. The results of recent work have shown that a considerable percentage of seed from mosaic plants of the wild cucumber may produce diseased plants the following spring. In this way the first mosaic centers are established, from which the disease is later carried to the cultivated crop in the near-by fields by the striped cucumber beetle and other insects. Additional evidence has been secured that the disease is also carried over winter in the seed of cultivated mosaic cucumbers.

Continued studies of cucumber anthracnose and angular leaf-spot have proved that these diseases live over winter in the soil on dead diseased plants and other refuse and that they are also carried on the seed from infected fruits. A successful and practical method of seed disinfection by means of mercuric chlorid has been worked out and applied on a commercial scale, with successful results in the control of both these diseases when combined with proper rotation of crops.

TOMATO DISEASES.

Particular attention has been devoted during the past season to the control of early-blight, or nailhead spot, of tomatoes in Florida, which causes serious losses in shipments to northern markets. Laboratory and field studies have shown that infection by this disease can take place only on small immature fruit. After the fruit attains a size approximately 2 inches in diameter, infection, even under the most favorable conditions, is impossible. It follows, therefore, that loss from this disease in transit can be avoided by packing only sound and mature fruit and that control measures must be applied in the field. Preliminary experiments have shown that spraying with Bordeaux mixture is an effective means of control.

THE MOTTLING DISEASE OF SUGAR CANE.

There are several diseases of sugar cane that deserve special attention. Some of these, such as the root-rot and red-rot, have been known in this country for several years, but exact control measures have not been worked out. The malady most recently discovered in the cane fields of the United States is the mosaic or mottling disease, which has been known in Porto Rico for several years and has apparently existed in Cuba, Java, and Hawaii for a longer period. The cause is not known. It is propagated through the seed cane and probably is carried from plant to plant by one or more species of insects. The disease does not infect the soil and certain varieties of cane are immune to it. Of the susceptible varieties some are more readily and seriously affected than others. A systematic survey has been started in the cane States in order to determine the extent and seriousness of the infestation. It is known to be present on all susceptible varieties at Audubon Park and at Cairo. This disease, though very destructive, is not considered as serious as root-rot.

POWDERY MILDEW OF THE APPLE.

Apple powdery mildew has recently been causing great alarm among the apple growers in the irrigated sections of the Northwest. Complete control is usually secured by the application of sulphur sprays early in the season. When late applications are necessary, sulphur can not be used, as it is sure to cause injury. Various other spray materials are being tested for use late in the season.

SPRAY MIXTURES FOR CITRUS TREES.

The special spraying requirements of citrus trees have necessitated a comprehensive testing of combinations of spray materials. A method has been found for combining oil emulsion with lime-sulphur solution, and the resulting combined spray mixture gives promise of reducing the number of spray applications necessary and in increasing effectiveness in the routine treatment of citrus trees throughout the year.

NEMATODE INFESTATION OF CLOVER SEED.

Early in the summer of 1919 attention was drawn to the fact that a clover disease of considerable importance had visited southern Idaho and other irrigated districts of the Northwest. It was a

disease which had been previously known but evidently had been increasing in its intensity for several years. It had made such headway in the clover fields of Idaho in a short time as to lead to the suspicion that some unusual agency was at work. Attention was at once given to the possibility of the transmission of the disease through the seed, with the result that it was shown that clover seed, even when re-cleaned, carries a considerable number of nemas, and in the case of the Idaho seed in particular it was shown to carry four different species of nemas, one of them belonging to the genus *Tylenchus*, namely, the well-known *Tylenchus dipsaci*, or *Tylenchus devastatrix*, the cause of a serious disease of bulbous plants and about 20 other crop plants, among them red clover. A general examination disclosed the fact that some living larvæ of this particular species occurred in clover seed 9 to 10 months after it was harvested.

WHITE-PINE BLISTER RUST.

White-pine blister-rust infection on *Ribes* is general in the New England States and northeastern New York. Many widely distributed incipient pine infections are beginning to appear as a result of heavy *Ribes* infection in 1915 and 1916, but the disease has not yet had time to produce severe damage to pines on a large scale. Infested areas vary in size from a few pine trees within a hundred feet of infecting *Ribes* to 50 per cent of the pines within a radius of half a mile from diseased bushes.

It appears that in many regions the plan of protecting white-pine timber by the systematic eradication of *Ribes* will prove to be an economically sound policy.

In this campaign cooperation is maintained with the New England States and New York. The work is devoted almost entirely to perfecting cheap and effective methods of destroying wild *Ribes*, to practical demonstrations of these methods on local control areas, and to the encouragement of effective local eradication of *Ribes* in cooperation with towns, associations, and individuals.

Experience thus far gained on demonstration and local control areas has proved that under normal conditions at least 95 per cent of the wild *Ribes* on a given area can be removed at a cost ranging from 5 cents to \$1.50 per acre. It is too early to draw absolute conclusions as to the effect of *Ribes* destruction on the demonstration control areas during the past two years, but there is a noticeable lack of recent infection of pines on these areas, while on adjacent areas where *Ribes* have not been removed there is a steady increase in pine infection.

Intensive studies of infection centers have been made to obtain data as to the distance to which the disease may be carried from *Ribes* to pine. The limit of 1,700 feet, which is in use at the present time, is an arbitrary one, based on data now available.

Various chemicals and sprays are being tested in the hope of finding a cheap and practical means of killing wild *Ribes*. The results obtained indicate that dip oil, fuel oil, and possibly sodium arsenite can be used economically to destroy dense growths of *Ribes* where the cost of hand pulling is excessive.

The inspection of nursery stock and pine plantations and the general scouting for the disease on pine and Ribes are carried on in New Jersey, Pennsylvania, and the southern Appalachian region; also in the Middle and far Western States. Formal or informal cooperation is maintained with these States. One or two planted trees were found diseased last year in Pennsylvania, in Michigan, and also in New Jersey. In the last-named State the disease was also found on four patches of cultivated Ribes.

Scattered pine and currant infection exists in Wisconsin and Minnesota. It is not yet clear whether the complete eradication of the disease will be practicable in these States. The results of scouting in the far Western States indicate that this region is free from white-pine blister rust. Continued scouting in these States is most important and should be actively pursued during the period required for the solution of the Minnesota-Wisconsin infection problem.

CITRUS-CANKER ERADICATION.

The work of eradicating citrus canker from the citrus regions of the South is progressing steadily. No epidemic outbreaks of serious proportions have occurred during the year in any of the States affected, and a gradual reduction of inspection work has been possible without jeopardizing the eventual complete eradication of the disease.

REPORT OF THE FORESTER.

HENRY S. GRAVES, *Forester.*

THE EXTENSION OF FORESTRY PRACTICE.

The year covered by this report was signalized by a new movement for extending the practice of forestry. More than 20 years ago the Division of Forestry offered to give advice and assistance to private timber owners who might wish to consider applying forest management. The offer received a remarkable response and formed a real turning point in the forestry movement. For the first time forestry in the United States became something which a business man could grasp and weigh on its merits as a definite business proposal. This aided powerfully in bringing the whole question of forestry, public as well as private, before the country. But it did not result in any widespread acceptance of the practice of forestry by timberland owners.

The failure of this early movement to get private forests extensively under management was, however, not immediate. The Division of Forestry made its offer of cooperation early in the fiscal year 1898. By the close of the fiscal year 1905 requests had been received for the examination of private holdings, large and small, comprising all told more than 10,900,000 acres of land. Many requests were from lumber companies and other owners of extensive timber tracts. On the strength of the showing made by the preliminary examinations, a number of these large owners entered into cooperative agreements for

the preparation of working plans. The interest of the lumbermen was much increased by the fact that the young foresters were able to show them that they were losing money by certain wasteful practices. Closer utilization spread rapidly through the industry. Public interest in forestry and an intelligent idea of what it meant became general. In the early years of the present century it really looked as though the management of forests as permanent productive properties might be voluntarily undertaken by private owners on a very large scale. Although many obstacles were presented by the internal conditions of the lumber industry, progressive lumbermen were giving much serious attention to the possibility of engaging in the practice of forestry. The chief stimulus was furnished by the rising value of stumpage.

The panic of 1907 radically changed the situation. The lumber industry entered a period of protracted depression. From that time on private forestry made relatively little progress in the United States, except on farm woodlands. While public forestry has made vast strides, the forests of the country that are in private hands are being depleted with very great rapidity, and almost everywhere without effort to renew them. A grave situation is becoming manifest in various ways. This is why the Forest Service is now putting forth a new and energetic effort to call public attention to the facts and to propose a program that will afford relief.

The problem presented is one that can be solved only by public action. The general practice of forestry on privately owned lands in the United States will not take place through unstimulated private initiative.

The magnitude of the National Forest enterprise and the prominence given to its accomplishments have given the impression to some that the problem of forestry is under way of solution. In point of fact, this is by no means the case, for the National Forests represent in area only about a quarter of the forest area of the country and less than that proportion of the actual standing timber. Private owners therefore hold more than three-fourths of the present timber supplies of the United States. The amount of material which is actually placed on the market from the National Forests amounts to only about 3 per cent of the entire consumption of the country. The rest comes from private lands. While the proportion will be altered, the country must still look to private lands for a large part of its forest supplies.

The rate of depletion of our forest resources is more than twice, probably three times, what is actually being produced by growth in a form which will be servicable for products other than firewood. High prices of lumber are not wholly due to the increased cost of labor and materials. A part is due to the ever-retreating sources of timber supply. Already the supplies of all our eastern great centers of production are approaching exhaustion with the exception of the South, and even there most of the mills have not over 10 to 15 years' supply left of virgin timber. Already the southern pine is being withdrawn from many points as a competitive factor and its place taken by western timbers, with consequent freight charges which the consumer must pay. Communities needing to build roads and other public works which involve increased taxation are often having brought sharply to their attention the economic consequences of stripping off the forests and leaving in their stead unproductive

wastes of low taxable value now or in the future. These facts are recalling public attention to the effects of uneconomic and wasteful exploitation of our forests in the past and to the need of steps which will put a stop to the destructive processes and replace them with methods which will build up rather than injure the country.

The situation necessitates a broad policy of forestry for the whole Nation which will include both an enlarged program of public acquisition of forests by the Government, the States, and municipalities and protection and perpetuation of forest growths on all privately owned lands which may not better be used for agriculture and settlement.

The proposed plan for realizing these objectives contemplates cooperation between the Federal Government and the States. The Government and the States must join hands in working out a program that will bring into correlation the various public and private efforts for the protection and right handling of forests. The function of the Federal Government, in addition to handling the National Forests, would be to stimulate, guide, and coordinate State action and conduct necessary investigations regarding the best methods of forestry, to assist the States in classification of land, and to harmonize action as between the different States. The States would also have a function in handling public property owned by them, and they would have a further direct responsibility in connection with the protection and perpetuation of private forest lands.

In the matter of private forestry the Government would work primarily through State agencies. To initiate the proposed policy there should be a Federal law authorizing the Government to cooperate with the States in bringing about the protection and right handling of forest lands within their borders, and providing means for such cooperation.

The net result of the steps already taken to inaugurate and organize the new movement for forestry has been to attract renewed and widespread attention to the fact that a real forest problem must be reckoned with, and is of national concern; to establish a conviction in the minds of many who have first-hand knowledge of the facts that definite action to protect the public interests involved and safeguard a resource essential for economic and industrial stability is now required; and to secure what is believed to be a feasible program, of a character to command general acceptance as it becomes fully understood.

THE NATIONAL FORESTS.

RECEIPTS AND OPERATING EXPENSES.

The receipts from the National Forests in the fiscal year 1919 were greater by \$783,484.79 than in the previous year. This is the largest increase ever made in a single year. The receipts totaled \$4,358,414.86.

To this total the grazing business contributed \$2,609,169.85, the timber business \$1,540,099.96, special uses (i. e., the occupancy of lands for miscellaneous purposes), \$136,822.99, and use for water-power development, \$72,322.06. The receipts from grazing exceeded those of 1918 by \$883,347.91, while the receipts from timber declined \$93,549.46. Special uses showed a gain of \$15,616.05, and water power a falling off of \$21,654.29.

The falling off in the receipts from timber was not due to any material reduction in the current timber sale business but is explained

chiefly by the fact that in 1918 settlement was secured under a court judgment of a claim against one of the transcontinental railroad companies amounting, with interest, to \$89,264.

The increase in the receipts from grazing was due to the fact that last year the final step was taken in carrying through the advance in the grazing fees, proposed in 1916 and inaugurated in 1917.

With the stockmen paying more than two and one-half million dollars annually into the public treasury for use of the National Forest ranges, there is strong reason for their urging that the Government expenditures aimed at making the range more useful should be increased. Unquestionably the value of the range, to the live-stock producers and to the country, can be developed to a higher point by constructing more improvements and pushing further the investigations which make possible the most efficient and complete utilization of the forage crop and the most highly perfected methods of live-stock management. Since the Government receives a return on what may be called development expenditures, in the form of additional grazing fees, increased expenditures for this purpose would seem wise as well as reasonable.

That the receipts from grazing now exceed those from timber by more than a million dollars and form 59 per cent of the total receipts from all sources is due to the fact that practically the entire forage crop can under present conditions be utilized, while the annual timber cut is but an insignificant fraction of the sustained yield obtainable from the Forests, or of the total cut of the country. There is very little range which is not accessible to live-stock, but the bulk of the timber is still out of reach of the lumbermen.

The receipts of 1919 were 175 per cent of those of 1915, while the cost of operating the Forests has remained practically stationary during these four years. The appropriation act for the current year made increases in the items for a number of the individual Forests, aggregating \$266,074. Most of these increases were to strengthen the protective system on the Forests where the danger of costly and destructive fires is greatest because of the inaccessibility of the country. These new funds did not become available until after July 25, when the fire season was reaching its height, which precluded the carrying out of the plans contemplated when the increases were asked for. Before the end of June the worst fire season ever faced in the Northwest had begun. When it ended the expenditures for fire fighting had so far exceeded the appropriation for that purpose that it became necessary to ask a deficiency appropriation from Congress of \$2,950,000. Again, as in last year's report, it must be pointed out that greater outlays for fire prevention, early detection, and swift concentration of fire-fighting forces would be much more economical.

THE NATIONAL FOREST PROPERTIES.

The net area of the National Forests at the close of the fiscal year 1919 was 153,933,700 acres, as against 155,374,602 acres June 30, 1918. The corresponding gross areas were 174,261,393 acres and 175,951,266 acres. The gross area includes all lands within National Forest boundaries; the net area excludes alienated lands.

These figures indicate a decrease of 1,440,902 acres in net area and a decrease of 1,689,873 acres in gross area. Eliminations made either by presidential orders or proclamations or by special acts of Congress

totaled 1,658,989 acres, in 25 National Forests. The act of February 26, 1919, creating the Grand Canyon National Park, eliminated from the Kaibab and Tusayan National Forests and transferred to the Grand Canyon National Park 606,720 acres. State selections authorized under a proclamation of June 4, 1912, were approved in the St. Joe National Forest, in Idaho, aggregating 21,262 acres. Eliminations by Executive orders or presidential proclamations, as a result of the land classification that is now nearing completion, reduced the National Forest areas 1,031,007 acres. Furthermore, a considerable acreage passed into private ownership under the usual operations of the mining laws and the Forest homestead act.

These reductions in area were in a small degree offset by three small public-land additions. Presidential proclamations increased the Dixie National Forest in Utah 8,328 acres and the Humboldt Forest in Nevada 28,020 acres. By the act of March 3, 1919, 2,886 acres were added to the Minam Forest in Oregon.

Increase of the National Forests in the East through purchases continued at a conservative rate. The total net area of public land in the National Forests established from purchase areas now aggregates 1,347,666 acres. Of this amount 1,333,405.03 acres have been purchased, the remainder being unoccupied and unentered public lands in the Alabama National Forest. At the close of the fiscal year there remained a total of 396,493 acres approved for purchase by the National Forest Reservation Commission and under process of acquisition, and the plans for ultimate acquisition embraced additional areas aggregating 4,422,167 acres. The purchase activities were largely confined to areas previously approved for purchase and to the consummation of negotiations already pending. The National Forest Reservation Commission desires, so far as practicable, to round out and complete the present purchase areas for practical administrative units before initiating purchase activities in other regions.

At the close of the fiscal year there were pending in the Interior Department proclamations providing for additions in the Western States totaling 283,780.54 acres. Of this 75,050 acres represents additions in the State of Wyoming authorized by special acts of Congress. The prevailing sentiment in the public-land States is now generally favorable to the extension of the Forests. This is indicated by the fact that at the present time there is pending in Congress legislation providing for 10 different additions to National Forests in the public-land States in which such additions can only be made with the consent of Congress. These proposed additions aggregate approximately 1,700,000 acres. The most important of the projects now before Congress is one for adding to the Idaho and Payette National Forests the region commonly known as the Thunder Mountain country, of approximately 1,120,000 acres. This proposed addition was discussed in last year's report. It has been strongly urged by successive sessions of the Idaho State Legislature, and is very desirable in order to give this area the protection and regulation it has so long and so urgently needed.

PROTECTION.

Mention has already been made of the emergency condition which arose during the fire season of 1919 in the Northwest. Th

National Forests of western Montana and northern Idaho are heavily timbered, and most of the country which they cover is exceedingly mountainous, rugged, and undeveloped. Because of its wild character, its remoteness from centers of population and bases of supply, its lack of means of communication, its large stand of valuable timber and importance for watershed protection, and because of the climatic conditions, it presents the problem of protection in its most extreme form. Nowhere else, experience has proved, is the control of fires so difficult or so expensive.

The region is subject to severe droughts, in which almost no rain may fall for months; when such drought seasons occur the forests become almost like tinder; and frequent electric storms supply the sparks. Lightning fires generally start in the high mountains, where they are most difficult to reach and fight. Their control necessitates special provision, first, for discovering and getting to them quickly before they have gathered headway; and, secondly, for throwing against them and maintaining in the field large forces of fire fighters in case their immediate suppression becomes impossible.

The experience of the past season simply emphasizes the conclusion set forth in my report of a year ago. The protective system must be strengthened along lines which will permit of quicker work. The choice is between, on the one hand, provision for a moderately expanded regular protective organization or, on the other hand, unnecessarily large danger of terrific fires and huge emergency expenditures. Last summer these emergency expenditures for fire fighting in the western Montana and northern Idaho Forests came to more than ten times the regular protective funds provided for the same Forests. While the danger of great fires can no more be entirely eliminated on the National Forests than it can in our large cities, it can and should be minimized.

Control of last summer's fires was made especially difficult by various circumstances. The delay in the enactment of the Agricultural appropriation bill embarrassed the early building up of the protective organization. Labor was at times difficult to secure to the extent needed, and was generally less efficient than usual; while it was always hard to secure men experienced in fire fighting for foremen. Very serious, however, was the further fact that the Forest Service has been losing its trained men very rapidly, owing to its inability to hold men at the present rates of compensation prescribed by law; and in consequence in many cases the forest officers were comparatively new men or men who had been recently transferred from some other district and had not yet become thoroughly familiar with the local country. Undoubtedly this was responsible for failure in a number of instances to get fires extinguished more promptly and economically.

Through a succession of unusually dry years the Forest Service has been able to prevent a catastrophe. It has held down the loss of merchantable timber to an amount which, under the circumstances, is reasonably small. It has prevented injury and destruction to property worth several hundred million dollars. On the other hand, a large expenditure has been required to fight fires, and in the aggregate a large area of old burns has been burned over, with resulting destruction of a great deal of young growth. The reasons for the failure to secure better results may be summed up as follows:

(1) The Forests have not yet been sufficiently opened up with roads and trails. It is still necessary in many cases to build trails through the woods to the fires. This may require several days, during which a fire may have become a great conflagration.

(2) The regular protective force is insufficient.

(3) The Forest Service is almost wholly unequipped with motor transport. Aside from the fact that the cost of hiring trucks to transport men and supplies for fire fighting is very large, the difficulty of obtaining such transportation sometimes results in failure to reach a fire before it is too late. Adequate equipment with motor trucks would save a great many thousand dollars each year.

(4) Successful fire protection is absolutely dependent on a permanent force of trained men. Without that, fires which should be put out promptly with little loss or cost spread widely and require many thousands of dollars to prevent disaster, let alone extinguish them.

(5) Public sentiment in many places has not yet roused to the need of care in the forest and public cooperation. There are still too many railroad fires, too much carelessness in the woods, particularly from smoking, and too many fires from clearing land.

The answer to the forest fire problem is therefore more roads and trails, sufficient salaries for our forest officers to enable the building up and holding of a well-trained force, greater leeway in furnishing motor equipment for fighting fires, which could also be used in road improvements, and a more vigorous campaign to educate the public to better cooperation in fire protection.

There were relatively few large fires during the fiscal year on the National Forests elsewhere than in the northern Rocky Mountains and Pacific Coast States, although unfavorable conditions were widespread. In the last six months of the calendar year 1918, after an early summer fire season of unusual danger in all parts of the West, except in Colorado, Wyoming, and South Dakota, where light rains fell with sufficient frequency to mitigate the drought, the situation improved materially as the season advanced. The fall rains generally set in early; and in the Southwest, where the fire danger occurs in two distinct seasons, one in the spring and early summer and one in the fall, the fall fire season was of short duration, with good showers at frequent intervals. In southern California conditions were threatening until late in the fall, but throughout the State the fires of the latter part of the calendar year 1918, were well controlled. Especially notable was the reduction in the number of man-caused fires in California which followed a vigorous campaign of public education waged by the Forest Service in cooperation with State and other public agencies. In Minnesota no large fires burned on the National Forests, in conspicuous contrast with what happened in other parts of the State. In the southern Appalachian Forests the climatic conditions during the fall were less favorable than normally, but only one large fire occurred; this was on the Shenandoah, in October.

The following table gives certain statistics regarding the 1918 fires. The total number, 5,573, shows a reduction of 2,241 from the number which occurred in the previous calendar year. The area of National Forest lands burned over was 694,651 acres, as against 962,543 in 1917; the estimated damage on these lands was \$688,332, as against \$1,358,627; and the total cost of fire fighting was \$714,009.63, as against \$1,121,451.

Fires on National Forests, calendar year 1918.

Extent and causes of fires.	Number of fires.	Percentage of total.	Extent and causes of fires.	Number of fires	Percentage of total.
Area burned over:			Causes of fires:		
Under 0.25 acre.....	2, 475	44. 41	Railroads.....	613	11. 09
Between 0.25 acre and 10 acres.....	1, 572	28. 21	Lightning.....	2, 457	44. 09
10 acres and over, damage under \$100.....	1, 146	20. 56	Incendiary.....	257	4. 61
10 acres and over, damage \$100 to \$1,000.....	270	4. 85	Brush burning.....	361	6. 48
10 acres and over, damage over \$1,000.....	110	1. 97	Campers.....	943	16. 92
Total.....	5, 573	100. 00	Lumbering.....	104	1. 86
			Unknown.....	658	11. 81
			Miscellaneous.....	175	3. 14
			Total.....	5, 573	100. 00

Of the 110 fires listed above as having burned over an area of 10 acres and more with damage in excess of \$1,000, 35 were in Idaho, 30 in Oregon, 14 in Washington, and 12 in California. In total number of fires of all classes California came first, with 1,148, followed by Idaho with 832, Oregon with 775, Montana with 573, and Washington with 563. Seventy per cent of all the fires occurred in these five States.

Since the fire season of 1919 is not yet closed, final statistics regarding this year's fires can not of course be given. Preliminary estimates indicate an area burned over up to September 30 of approximately 1,500,000 acres, while the fire fighting expenditures from July 1 to September 30 were close to \$3,000,000.

MANAGEMENT.

TIMBER.

There was a decrease of 3 per cent in the cut of National Forest timber under sales, and of 0.5 per cent in the receipts from sales. In a period when the lumber cut of the United States as a whole dropped off 11 per cent, this sustained use of National Forest timber indicates the stable source of supply which has been established in the National Forests for the local lumber industry and for the general timber requirements of the country. New sales of timber decreased 45 per cent. This decrease is attributable to the war production conditions existing during the first part of the year and to the high cost of steel rails, machinery, and other materials, which has discouraged the development of new lumbering enterprises in the National Forests.

Since April, 1919, the lumber market has been characterized by advances in prices exceeding in rapidity anything previously known in the history of the industry. This condition appears to be due to the sudden and wide-spread resumption of building activity and to the shortage of existing lumber stocks. The production of lumber is responding but slowly to this demand on account of the shortage of labor and the high cost of supplies. The advance in lumber has, however, been reflected during the last three months in a sharpened demand for National Forest stumpage, which bids fair to increase materially the rate of cutting. Such increases will be progressive and somewhat slow, because a certain length of time is required for

the appraisal and advertisement of large tracts and time is needed also for new installations under present conditions.

One of the more important developments in forest management which must be pushed with vigor is to determine within closer limits than has yet been possible the quantities of timber which may be cut from forest units on a basis of permanent production. The demand for National Forest timber in some localities has about reached the growing capacity of the areas forming the logical source of supply. It is of the utmost importance that the industrial developments supported by National Forest stumpage be permanent and that no pressure for the immediate use of timber be permitted to exhaust such National Forest areas within a few years, leaving a wake of sawdust piles and deserted lumber camps. The general principles upon which this development of National Forest management has been undertaken are: (1) To define areas, on the basis of topographic features or of industrial and economic factors, from which a steady yield of timber should be obtained; and (2) to determine the safe limit of yearly sales from each area in order that the yield may be continuous. Securing permanent and desirable conditions for labor in forest industries is an important phase of this development.

A second important extension in the effective use of National Forest timber is to obtain exact data upon their resources for making paper, both as to suitable woods and as to hydraulic power; and to make these resources available to paper manufacturers under practicable terms in view of the transportation and other conditions attending the extension of their industry into the Western States. The National Forests contain upward of 200 billion board feet of timber suitable for the manufacture of news print. Sales of pulpwood are now being made at a number of points as part supply for established paper plants. Several large tracts of timber of paper-making species have been appraised and advertised for sale or offered to the paper trade. Transportation conditions, labor problems, and the large investments required for the installation of paper plants have held back the development of such enterprises on the National Forests, notwithstanding the favorable timber and water-power conditions which are to be found at many points. This development, however, is bound to come, in view of the general paper situation in the United States; and the Forest Service is preparing for it.

Owing to the handicaps imposed by the reduction of field personnel in consequence of the war, timber surveys have been materially curtailed since 1916. With the prospect of increased activity in sales to lumber manufacturers and the need to be ready for the demand for timber likely to arise from paper manufacturers, it is important to expand again the timber-survey work. This work is fundamental to plans for wise management. During the year 448,547 acres were cruised and mapped by intensive methods and are now ready for timber sales, while 37,551 acres were covered by extensive reconnaissance.

The Agricultural appropriation act for the fiscal year contained a special provision for granting National Forest timber required for war purposes to any department, board, or committee of the Federal Government. Owing to the late passage of this measure, but one permit was granted under it to the War Department. This covered 6,000,000 feet, board measure, of which approximately

3,750,000 board feet were cut. Permits aggregating 5,758,000 board feet were issued to the Alaskan Engineering Commission under the act of March 4, 1915. This commission has cut to date approximately 30,000,000 board feet, under permit from the National Forests in Alaska.

Details regarding the cut and sale of timber are embodied in the following tables:

Timber cut under sales, fiscal year ended June 30, 1919.

1 cost sale.

REFORESTATION OF DENUDED LANDS.

Notwithstanding the drought during the last two seasons, a good percentage of success has been secured in most of the forest plantations on denuded lands in the National Forests. This is probably due to the experience which has been gained in the production of nursery stock and in the more effective methods of planting it in the field. A total of 6,911 acres was planted and seeded during the fiscal year. The largest planting operations are being conducted in the Northwest. Small plantations in the Lake States have been very successful, and the work will be largely extended in this region within the next five years. Some of the older plantations conducted by the Forest Service, particularly near Halsey, Nebr., are now assuming forest proportions and establishing veritable forest conditions in the midst of vast areas of treeless land.

The details of planting and sowing operations are given in the following table.

Planting and sowing on National Forests, by States, 1919.

RANGE.

Very exceptional range conditions characterized the seasons of 1918 and 1919. The closing of the 1918 season marked the termination of a prolonged drought throughout the Southwest, particularly in New Mexico, Arizona, and Texas. A very severe winter with a heavy snowfall followed, which caused heavy losses of stock of all classes. The 1919 season throughout the Southwest was unusually favorable for forage growth. Throughout Montana, Idaho, Utah, Wyoming, northern Colorado, the western half of Nebraska, and North and South Dakota, however, one of the most severe droughts in the memory of the oldest stockmen has prevailed. This drought probably reached its greatest intensity in Montana, northern Wyoming, eastern Utah, and Idaho. For three years the precipitation in this region during the growing season has been very light, but the 1919 conditions were the worst. The snowfall at the beginning of the year in the entire drought region was unusually small, and while a few heavy snows fell in the latter part of the winter, the snow did not pack and disappeared rapidly when warm weather set in. Temperatures during April and early May were much above normal, causing the snow to melt and run off sooner than usual. This caused a shortage of water for irrigating and stock watering purposes.

Forage growth of all kinds started early, with indications of a good season. Heavy freezes, however, during the last few days of May destroyed all of this new vegetation, upon which the sheepmen were dependent for feed for their flocks during the lambing period. These conditions also affected the cattlemen to some extent, as their stock did not immediately begin to increase in flesh. A long period of low precipitation immediately followed in the States above named, which greatly reduced forage growth.

The stream flow was far below anything previously recorded, and this had a direct influence upon the raising of farm crops, particularly hay, which has been reported as from 20 to 50 per cent below normal.

The production of forage on the unreserved public lands was very restricted, and the stockmen using these areas were forced to seek other range. The National Forest ranges, being at higher elevations, were not so greatly affected, and stockmen who held Forest permits were considered very fortunate. During the early part of July heavy rains occurred in northern Arizona, southern Utah, and parts of Nevada, which relieved range conditions materially throughout this region and reduced the drought area considerably. During the latter part of July rains occurred in northern Utah and southern Idaho. While they came too late to cause any appreciable increase in the hay crop, an immediate improvement in the summer, fall, and winter range was noticed, thus still further reducing the drought area.

The range situation looked so critical early in July that the Department of Agriculture considered it necessary to assist the stockmen in the drought regions. A committee organized for this purpose immediately undertook a canvass of the drought-stricken region to determine the numbers of stock for which other pasturage or winter feed would have to be provided in order to avoid placing this stock upon the market, and also sought to locate in other States places where feed or pastures could be secured for wintering stock shipped in from the drought-stricken region. The Forest Service cooperated with the

committee in making the canvass, by gathering data regarding the stock on the National Forest and adjacent ranges. It appeared that very heavy shipments would have to be made from the intermountain region. The situation in Montana and Wyoming was even more critical, for in many places in these States the estimates indicated that at least 75 per cent of the stock would have to be shipped to market or feeding points.

The relief committee, with the cooperation of many county agencies, agricultural representatives, and other Department representatives, is assisting stockmen to avoid the necessity of placing their drought-stricken stock on the market at a sacrifice by directing them to winter feed. In addition, it has been developed that large quantities of hay are available in the Middle Western States at prices sufficiently low to permit of its shipment into the drought regions for winter feeding. This fact with the localized rains that occurred over a large portion of the region during the latter portion of the season will greatly reduce the number of stock to be disposed of on account of lack of feed. The conditions in eastern Idaho, Wyoming, and Montana have not greatly improved, and it will be necessary for the stockmen in those States to make heavy shipments.

Live stock and wool prices fell off materially during the year. In the fall of 1918 prices were unusually good. An unusually mild winter, except in the Southwest, brought the stock through in excellent condition, without the necessity of heavy expenditures for hay or concentrated feed. The first evidence of declining prices was observed in the wool sales last spring. In addition the stockmen had serious difficulties in securing competent help. Old employees familiar with range conditions and Forest regulations readily found more remunerative and easier positions in other lines of work.

The importance of the National Forest ranges to the stockmen was strongly emphasized by the events of the year. Never before was the demand for range on the Forests so great. This was particularly true in the drought-stricken regions, where stockmen, using the unreserved public domain or private pastures, eagerly sought Forest permits in order to save their stock. The value of the system of range regulation in use has been so thoroughly demonstrated that at the public lands convention held in Salt Lake City on August 21—a gathering of representative stockmen from all of the Western States—the convention went on record in favor of placing the remaining unreserved public lands under Federal control and having them managed under a plan similar to that in effect on the National Forests.

A plan for granting 5-year permits was put into effect on a large number of the Forests. It is too early to determine the results.

Larkspur eradication upon the scale desired proved impossible, partly for lack of men to supervise the work, partly because the scarcity and high cost of labor prevented the stockmen from cooperating extensively. However, larkspur was eradicated from 1,657 acres during the year, making a total of 3,580 acres grubbed since the work began, at a cost of \$5.50 per acre. The stockmen contributed about one-half the expense. A resultant saving in cattle of \$34,000 annually is estimated, on the basis of the average previous recent death loss and a valuation of \$50 per animal.

It was planned to carry on the eradication work for the season of 1919 on all projects not completed, and to undertake grubbing on new

areas where cooperation could be secured and funds were available. The exact acreage infested is not definitely known, but from the number of cattle reported as dying on infested ranges it is evident that a large saving is feasible. With the present great demand for Forest range and high prices for cattle the need for continuing the eradication work can not be overemphasized.

The following table shows the number of permits issued and number of stock grazed upon the Forest ranges during the fiscal year ended June 30, 1919:

Grazing permits issued and number of stock grazed.

Total, 1918.....	32,600	2,137,854	102,156	3,371	6,513	8,454,240	57,968

There was a reduction of 72 cattle and horse permittees and an increase of 111 sheep and goat permittees, making a net increase for both classes of 39 as compared with the previous year. Fewer cattle, horses, and sheep were grazed, but the number of swine and goats slightly increased. The horses grazed on the National Forests are very largely of a small and inferior type which do not return a profit to the owner; consequently there has been a marked tendency on the part of these owners to dispose of their horses and substitute more valuable kinds of stock.

It will be observed that the decrease in the number of cattle was insignificant—only 2,327; but that the number of sheep was decreased by over 500,000. During the grazing seasons of 1917 and 1918 the number of cattle on the National Forests was increased over 379,000 head and the number of sheep over 611,000 head, as a war emergency measure. Since the closing of the war it has been necessary to reduce the number of stock on many of the ranges to prevent serious damage to the ranges. Investigations showed that forage could be provided for practically the full number of cattle, but that a reduc-

tion in the number of sheep to practically the prewar number was imperative. The bringing into use of more range for cattle through the eradication of poisonous plants, securing a more uniform utilization of the forage on the cattle range through better distribution, and the adoption of the common use of range by cattle and sheep whereby a limited number of cattle utilize forage not palatable for sheep are the reasons why there has been practically no reduction in the number of cattle.

LIVE-STOCK ASSOCIATIONS.

Regulated management of the National Forest ranges during the past 14 years has had a marked influence on the formation of live-stock associations and the development of this field of activities. The old system under which each permittee gave individual attention to his stock while on the range is being widely replaced by a pooling of interests along certain lines, accomplished by forming live-stock associations with executive committees to handle many of the details of stock management. Many of the executive committees employ herders for the stock while on the range, buy and distribute salt, in some cases buy bulls, and take charge of other management and improvement matters which promote the best interests of the permittees and the highest use of the range. The method employed is the adoption of special rules, passed by the association and approved by the Forest Service. Compliance with these rules is then required of all users of the National Forest range involved. Practically all of the more progressive associations have adopted such special rules as meet the needs of their localities. Membership in the association is open to all live-stock owners using the range in question, and a majority of all users must belong to the association in order to secure its recognition by the Forest Service.

The advantages of cooperation are shown by the number of live-stock associations recognized by the Forest Service. In 1917, 359 stock associations were cooperating with the Service. Last year there were 544, an increase of over 51 per cent. So firm are the owners of live stock that graze upon the National Forest ranges in their belief in the value of organization that of the 4,246 permittees in the States of Oregon and Washington over 3,000 are members of live-stock associations.

In many cases advisory boards have recommended reductions in the number of stock upon a given range; they have also suggested changes in grazing seasons, with a view to securing the greatest benefits to the users and an improvement in the range. In practically all cases associations have interested themselves in constructing range improvements such as drift fences, in water development, in the eradication of poisonous plants, and similar matters. The expenses for the improvements are secured through assessments. The value of organized cooperation is most evident on range allotments where conditions of use are very intensive and the permitted stock belongs to a large number of small owners.

WATER POWER.

Not much water power development has taken place since the United States entered the war. Increased war demands for electric power could not be deferred for the time necessary to construct

water-power plants but had to be met in greater part by the construction of new steam plants and by the interconnection of existing plants. At present financial and industrial uncertainties and the unsatisfactory character of Federal laws are resulting in further postponements of water-power utilization. Any considerable utilization of our undeveloped water powers must await both the enactment of legislation and the stabilization of the general economic situation.

The receipts from water-power permits and easements were \$72,322.06, as compared with \$93,976.35 for the fiscal year 1918. Ten applications for preliminary rental permits were received, 14 for final rental permits or easements (of which 9 were for transmission lines only), and 11 for free permits or easements (of which 3 were for transmission lines only). Data concerning projects under permit at the close of the year are given in the following tabulation:

Water-power sites and transmission line rights of way under permit and easement, fiscal year 1919.

RECREATION AND GAME.

Plans for the management of the National Forests must aim to provide for an orderly development of all their resources, for the use and benefit of the public. Such plans would be incomplete if they failed to take into account the wild life and the recreation resources.

Use of the National Forests for recreation was greater than ever before. There is not a single Forest, and there is scarcely a ranger

district, which does not have some features of recreation interest. Sometimes it is the mountain scenery, sometimes the beauty of forests, lakes, and streams, sometimes the opportunities for sport in the form of fishing, hunting, or mountain climbing, and sometimes it is still other kinds of attractions which lead yearly increasing number of visitors to the Forests for recreation and health.

Because of this expanding use adequate administration of the recreation resource has become of marked importance. The western National Forests are, by virtue of their location and character, the natural public playgrounds for most of the country west of the Mississippi, and they also draw many thousands of visitors from the East. They must be handled with full recognition of their recreation values, present and future. This requires careful and forward-looking plans providing both for the protection and the development of this important resource.

Protection of the recreation resource involves measures that will safeguard for the use and enjoyment of the public the natural attractions which appeal to visitors and cause them to seek the Forests and also measures that will reserve for their use adequate supplies of wood and forage and afford pure water. Development of the resource is a still larger matter. It involves many things, but the most urgent primary need is provision of facilities for traversing the Forests and for living while in the Forests.

All these matters received attention. In cutting timber, operations are adjusted to protect scenic features, roads, camping places, and the like against loss of attractiveness. Forage is reserved for the horses of recreation parties. Water protection is looked after through sanitary regulations, the provision of hotel and other accommodations is encouraged, information of various kinds supplied, and in general the convenience and comfort of visitors promoted.

Of particular importance for the increase of use is the systematic and progressive development of roads and trails by which the Forests are being made more generally accessible. Every road and trail, whether it is built primarily for protection or for the development of some material resource, opens up new features of scenic interest. In a variety of other ways also development to meet the increased demand for recreation use is being undertaken. A number of recreation centers are being made ready for the public under plans carefully worked out by recreation engineers. Various such centers are already in use, such as the Red Fish Lake and Wood River recreation areas in the Sawtooth National Forest in Idaho, Eagle Creek on the Columbia River Scenic Highway near Portland, Oreg., Denny Creek on the Sunset Highway near Seattle, Huntington Lake in the Sierra National Forest, the Los Angeles Municipal Camp in the Angeles Forest, and the Laguna Mountains recreation area between San Diego and the Imperial Valley. At many other points the Forest Service is constructing shelter houses, improved camping places, etc.

It is becoming manifest, however, that an adequate policy of recreation involves still more. The services which can be rendered the local and general public, on the one hand, and the resources available for meeting these needs, on the other hand, need to be studied in the most comprehensive and thorough-going manner to the end that coordinated development of all these resources—whether found within

the National Forests, or in National Parks, or in properties belonging to States and municipalities—may be secured. For example, the full recreation value of the Oregon National Forest, which surrounds Mount Hood and borders on the Columbia River Valley, can be realized only through a development coordinated with what the City of Portland and the Counties of Multnomah, Hood River, and Clackamas have undertaken to do and have largely accomplished. Such a coordination has in this particular case been effected, with most happy results. Again, recreation development in the Yellowstone Park region can not be made to serve the public interests to best advantage if National Forest administration is uncorrelated with the administration of Park, and vice versa. In short the National Forests, which must be administered with a view to recreation use as one of their major functions, can not carry out that function in fullest measure except through cooperative relations with other agencies in the same field, resulting in joint effort under a truly national and common policy.

The wild life resource of the National Forests is in many ways closely related to recreation. It comprises mainly the game, the fish, and the fur-bearing animals, and the matter of most immediate importance is suitable provision in the administrative plans for the perpetuation of the existing herds of elk.

In spite of difficulties created by war and other conditions that made it necessary to carry on the ranges all the domestic live stock for which a place could safely be found, progress was made in working out better methods of elk conservation and in providing more ample feeding grounds for the herds in and around Yellowstone Park. In general, recognition of the fundamental problem involved has been secured to a greater degree than ever before, and an increased public support has been obtained in carrying out the protective and constructive work necessary to solve the problem. The Forest Service is formulating as fast as possible plans which will coordinate the various other uses of the National Forests with game conservation. This is especially important in connection with grazing use. In places it is necessary to restrict or entirely prohibit grazing in order to take care of the elk. The most important single situation of this kind is that near the Yellowstone Park.

For several years a study has been conducted by the Forest Service in cooperation with the Biological Survey of the habits of the Yellowstone elk, their requirements, and other matters, knowledge of which is necessary as a basis for a practical program. This program, which was completed during the past year, calls for certain legislative and administrative action. A beginning was made on the administrative phases by imposing added restrictions upon the use by domestic stock of portions of the National Forests adjoining the park. Some lands were wholly reserved and others restricted to limited use by cattle during certain months. A beginning was also made in the progressive exclusion of stock from areas where total exclusion could not be put into effect at once. The program for handling the Yellowstone elk was placed before the public with a view to full discussion and consideration of the proposals for State and national legislative action.

While it may require slight changes and revisions from time to time as conditions alter, it is believed that the underlying principles are essentially correct. The program was approved by the Benevo-

lent and Protective Order of Elks at its last annual meeting, as well as by the leading sportsmen of the country. The study of these herds must necessarily be continued until the working plan is fully established.

The study of the Sun River elk herd in the Lewis and Clark Forest was continued, and an examination of the area used by the Roosevelt elk in the Olympic Forest was made to determine the number of elk in this herd, the range used during the different seasons of the year, and the number and kind of animals that would have to be disposed of annually if it appears that the herd should be maintained at its present size but not permitted to grow larger, on account of lack of suitable feeding grounds to support a greater number without recurring seasons of starvation.

Marked progress was made during the year in bringing together the interests of the States and the Federal Government in game matters. In various instances it has been possible to make State and Federal authority mutually supplementary in accomplishing things difficult for the Government or State working alone.

COOPERATION WITH STATES.

While the forest fire protective systems maintained by the States in cooperation with the Federal Government have been extending, there has also been a recent greatly increased cost of operation. The appropriation of \$100,000 is now very inadequate.

Expenditures from the Federal appropriation, and the expenditures of the States which have entered into cooperative agreements, are shown in the following table. The area protected was much greater than ever before. This was made possible by the fact that the cooperative funds contributed by States and private owners were greater than in 1918. The Federal fund was of course the same as in 1918.

Cooperative expenditures from Federal appropriation and by the States for protecting forested watersheds of navigable streams from fire.

An agreement entered into with Rhode Island made that State the twenty-third to enter into cooperation. Toward the end of the fiscal year California requested cooperation, but the agreement had not been completed when the year closed.

Protection from forest fires is the first essential to forest conservation. Without an organized and efficient system, such as can be maintained only with adequate regular appropriations, the forests can not be made safe. No better proof of this could be given than the situation which arose in Minnesota in the fall of 1918, when a large number of relatively small fires burned for weeks because of lack of men and equipment to extinguish them, and finally came together in five large conflagrations, according to the State Forester, which in the aggregate swept over not less than 200,000 acres, destroyed property worth about \$25,000,000, and caused a loss of more than 400 lives. Estimates based on forest fire statistics collected in cooperation with State and private agencies indicate that in the calendar year 1918 not less than 25,000 fires occurred, with an area of fully 10,500,000 acres burned over and a financial loss in timber, young tree growth, and improvements of about \$40,000,000. Railroads caused approximately 18 per cent of the fires, brush burning and campers each 13 per cent, lightning 10 per cent, incendiaries 9 per cent, miscellaneous causes 7 per cent, lumbering 5 per cent, and unknown causes 25 per cent.

The States of Alabama, Florida, Georgia, Idaho, Illinois, Maine, Massachusetts, Montana, New Hampshire, North Carolina, Tennessee, and Texas received assistance during the year in formulating forest policies, drafting forestry laws, and the like.

RESEARCH.

INVESTIGATIONS IN FOREST PRODUCTS.

From many standpoints the fiscal year 1919 was the most important in the history of the Forest Products Laboratory. Not only were many of the research projects started earlier in the war brought to a productive conclusion, but the peace-time application of their results was aggressively undertaken through widespread dissemination of the information and through personal contact with the wood-using industries.

During the first months of the year the laboratory was engaged exclusively on special war problems. Cooperation with the various bureaus of the War and Navy Departments which had provided special allotments was at its height, and requests from these departments had become increasingly specific. After the armistice was signed it was necessary to reduce the staff from 458 to approximately 300 persons and to discontinue some of the less important investigations. In accord with the desires of the War and Navy Departments, however, the more important projects which were nearing completion, or which were of special value, were continued. A number of new research projects were begun, but the year's accomplishments were, primarily, the outgrowth of fundamental research begun earlier in the war or prior to the beginning of the war.

Aircraft problems continued to occupy the position of greatest importance. The large fund of available data on wood, plywood, and glues found direct application in the solution of specific problems arising from time to time in the design of aircraft. Many requests were received from the War and Navy Departments for the development of various aircraft parts which could not well be designed without actual tests. Much of this work developed as a result of the successful design by the laboratory of a plywood wing rib for one of the Army planes.

Ribs for almost a dozen different types of Army and Navy planes were designed and tested by the laboratory and gradually improved to the point of maximum strength and minimum weight. These ribs were, in all cases, decidedly superior to commercial ribs of corresponding sizes. In addition to the specific design of these ribs, general laws governing the types of ribs to use for different sizes were developed, and several excellent types of large ribs perfected.

The design of airplane wing beams presented many complicated problems, and the laboratory was called upon to conduct elaborate series of tests on full-sized members to determine the relative merits of the many different types. The growing scarcity of suitable aircraft woods, demanding closer utilization of existing supplies, made it necessary to develop types of built-up beams which would permit the use of small and short stock. Tests were made upon several hundred beams of a number of different types, and several types were developed to meet the specific requirements involved.

Exhaustive tests were also made upon many different types of beam splices, and their relative efficiency was determined. As an integral part of these tests, the efficiency of various kinds of hide and casein glue was determined. Later in the year, assistance was requested in the design of a wing beam, or the development of a type suitable for very large machines, with spans of 125 feet or more. Special series of tests were made for this purpose, and a type was developed which embodies sound mechanical principles and is remarkably light for its strength.

Much specific information was needed by the Army and Navy in regard to the struts being used on various machines, and comprehensive tests were made by the laboratory upon various kinds and sizes. These resulted in the development of two noninjurious methods of testing struts, whereby the actual strength of each strut could be determined without injuring it. Machines for the proper carrying on of these tests were also developed, and specifications for the inspection of struts by this means were prepared. This method of test is unique, in that there are no other types of structural members which can be tested to their maximum load without injury. In addition, methods for the calculation of the strength of tapered struts and for the determination of the taper which would give the maximum efficiency were developed.

An entirely different kind of investigation was undertaken by the laboratory to develop a type of strut for extremely large flying machines. A radical departure was made from all accepted types of airplane struts, and a type selected which years of experience in the construction of buildings and bridges had proved to be very efficient in long light columns. This type was then modified to suit aircraft needs, and developed to a point where it was much stronger for a given weight than any other type of strut which has so far been developed. Wind-tunnel tests on models specially constructed for the purpose showed that the air resistance of this type is less than that of any other type so far tested.

Elevator and aileron spars, which are the main structural members of airplane control surfaces, are subjected to a peculiar kind of stress known as combined bending and torsion, and their design has always been a matter of guesswork. In the case of small machines this method of design appeared to be quite satisfactory,

but in the design of radically new types of great size need was found for accurate data on the design and also for a better type of spar, which would be both stiffer and stronger for the same weight. Through a unique combination of hollow wood and veneer construction, it was possible for the laboratory to improve the spars to a marked degree, both in strength and in stiffness. As a result of this development, the laboratory was finally requested to design a complete control surface, embodying this new type of spar.

Numerous and varied other aircraft developments were carried out, among them being the development of a flexible plywood for control surfaces and of a special mechanism for the proper operation of these surfaces. This plywood and the control mechanism are in process of being fitted to one of the fastest machines developed during the war.

One of the major lines of research was the determination of the effect of various kiln-drying schedules upon the properties of aircraft woods and substitutes for them. Exhaustive tests have furnished conclusive evidence that under proper control of temperature and humidity kiln-dried material of these species is as strong as air-dried lumber. They show further that the kiln-drying schedules recommended by the laboratory at the beginning of the war and based upon the incomplete data then available were in every sense dependable and are subject to practically no material changes. Up to the date of the armistice, assistance had been given in the design, installation, and operation of 325 Forest Service water spray kilns installed in 44 manufacturing plants throughout the country, including installations at the Government cut-up plant of the Spruce Production Division, and at the Rock Island Arsenal. At the latter plant a laboratory representative demonstrated that artillery wheel dimension oak, green from the saw, can be kiln-dried with insignificant loss in from 60 to 90 days as against 3 to 5 years of air seasoning. This was contrary to previous commercial experience. Other kilns were designed for use at Government arsenals, aircraft factories, gun manufacturing plants, and vehicle plants. The Signal Corps dry kilns at Vancouver, Wash., were started in June, 1918, under the personal supervision of a kiln expert from this laboratory. The first kiln load of airplane wing beams was taken out on July 16. Thereafter the kilns were continuously operated at full capacity of about 40,000 feet per day until the end of the war. A corps of kiln experts was maintained in the field to assist vehicle, furniture, and aircraft manufacturers in the adaptation and operation of commercial kilns used in war work, and intensive courses of training for Government and commercial dry-kiln operators and inspectors were continued until the armistice was signed.

The total number of laboratory strength tests was brought up to over 300,000. About 23,000 strength tests were completed on 32 species of plywood, to determine the strength variation with different combinations of species, number of plies, and ratios of core to total panel thickness. Many additional tests were made to determine the relative amount of warping of various species of plywood, the bending strength and methods of fastening, the relative strength of rotary, sliced, and sawed veneer, and the shearing strength and shrinkage of plywood. Other tests were made on various aircraft

parts of plywood, laminated, and fabricated material, such as engine bearers, struts, landing-gear disks, wing ribs, elevator spars, etc. Determinations were made of the mechanical properties of thin plywood for use as a linen substitute, and the relative efficiency of various types of riveted and scarf joints was investigated.

Tests conducted for the War Department made possible great improvements in overseas shipping containers, and many inspectors were trained in the fundamentals of box construction, for manufacturing and export inspection work. Wood preservative specifications were prepared for the Emergency Fleet Corporation and for the Railroad Administration. To assist the latter in its program of preservative distribution made necessary by the shortage of creosote, substitute preservatives were tested and recommendations as to their use were made.

Studies were completed of the effectiveness of various methods of coating and finishing wood to prevent the passage of moisture. Improved methods of finishing with varnishes were developed, and it was shown that protective coating with thin sheets of aluminum leaf is practically 100 per cent efficient. In an experimental shipment of airplane propellers from this country to France those treated by the aluminum-leaf process developed at the laboratory were the only ones to arrive in satisfactory condition. This method has been officially adopted by the Army and Navy.

The experimental study of the conditioning and manufacture of airplane propellers began to yield information of great value. At the completion of the study it will be possible to specify accurately the species of wood and the manufacturing conditions for the production of the most efficient propellers for the many kinds of service.

A number of new and greatly improved formulas for making waterproof glues for plywood manufacture were developed. One of these for casein glue shows about double the water resistance of the available commercial casein glues and is very resistant to molds. The specifications of the Army and Navy for all glue and glue ingredients were prepared at the laboratory. Much of the work on glues was carried on for the purpose of preparing these specifications. Several commercial concerns have adopted the laboratory glues in production. Numerous improvements were discovered in plywood manufacture that have also been successfully adopted in production.

There were identified 30,863 samples of wood, including some foreign woods, and many microscopic examinations for decay and defects were made. Information illustrating defects in wood was collected, and an illustrated key for distinguishing true mahogany from so-called mahoganies was prepared for propeller inspectors. Studies were made of the effect of moulds on wagon and airplane woods, and of the effect of steam bending on the structure of wood.

Active work on the value of various woods for paper manufacture was discontinued during the war to devote more time to pressing war problems. However, a reliable method for determining the tearing strength of paper was developed. A recording density hydrometer was invented which will be of considerable use in the control of the soda recovery of sulphate and soda pulp mills, acid making in sulphite mills, mixing in the manufacture of ledger, bank-note, and other fine paper, and in the chemical and textile industries in general. The value of waste hemlock bark from paper mills as a source of tannin

was also demonstrated. Methods for the production of soda and sulphate pulps suitable for nitrating and for rendering sulphite pulps suitable for this use were developed.

Shortly after the armistice was signed the Salvage Board of the Ordnance Department requested the laboratory to determine the suitability of second-cut cotton linters and hull fibers for paper manufacture. The War Department had on hand at that time a large tonnage of these linters reserved for the manufacture of nitro-cellulose and was seeking the best means of disposing of the surplus. Commercial pulping trials and paper runs made at the laboratory soon demonstrated that second-cut linters and hull shavings can be pulped with decidedly less chemical and bleach consumption than wood, and that they are excellently adapted for the production of high-grade book, writing, blotting, tissue, and other papers. These experiments may well have a far-reaching economic influence on the future of the paper supply of this country. Arrangements have been made for a practical mill trial where the value of this raw material can be demonstrated on a tonnage basis under average mill conditions.

The laboratory cooperated with the Chemical Warfare Service of the Army in gas defense work and developed an artificially dense wood charcoal practically the equal of coconut-shell charcoal. A suitable gas-mask filter for the removal of solid particles was evolved and tested. Experiments were conducted also on various phases of gas offense.

The threatened shortage of wood pitch for filling the seams of wooden vessels led to experiments with various kinds of mineral pitches, and an experimental deck is now undergoing exposure tests. Several of the mineral pitches seem to be satisfactory.

The readjustment of the laboratory's work to a peace-time basis has included:

- (1) The adaptation and application of the data and information obtained during the war to the Nation's industries on a normal peace-time basis.

- (2) Analysis of special reconstruction problems and the extent to which the laboratory could be of assistance in solving them.

- (3) Consideration of prewar projects and the advisability of resuming them or of starting new researches which appeared of greater importance from a broad reconstruction standpoint.

An illustration of the peace-time application of research conducted in connection with a specialized war project is found in the work of the propeller section. It was soon seen that the developments worked out in relation to the conditioning of wood and the use and formulas of waterproof glues had a far wider field of application than merely to airplane propellers. Following the armistice, therefore, experiments were started in several different lines of built-up construction where possibilities for the utilization of small pieces and waste material existed. Sets of bowling pins, shoe lasts, hat blocks, wagon bolsters and tongues, and other articles were made of laminated material and tested in actual use. These tests in most instances already indicate that the laminated construction for such articles will be practically as serviceable as solid material.

As a result of the war there has been a very marked stimulation in and acceptance of the value of research in forest products, and

the requests for cooperation and assistance which have come to the laboratory from many different industries have more than taxed the organization. It has, in fact, become necessary to decline cooperation in a great many instances on account of the inability of the decreased force to carry on the work. There is now open to the laboratory a tremendous field of research of great economic and industrial value.

Close relations were maintained through an office of Forest Products in Washington with the various branches and offices of the War and Navy Departments located in Washington and needing the cooperation of the forest products organization, and also with the War Industries Board, the War Trade Board, the Shipping Board, the Emergency Fleet Corporation, the British and other Allied commissions, and various commercial organizations and associations having to do with war activities. In this way it was possible to furnish data and information on which immediate decision relating to the purchase, storage, or use of timber could be made. Much assistance was given in the preparation of specifications for making purchases of forest products for construction purposes, vehicles, boxes, airplane material, etc., and in the inspection of timbers for ships, airplanes, and docks. Extensive files covering a wide range of data on forest products were maintained for quick reference. A large volume of statistical data was furnished for the use of foreign governments. The figures on production and consumption in many instances served as a basis for reaching conclusions on problems of utilization, substitution, and regulation of imports and exports.

After the armistice was signed arrangements were made to continue cooperation with the Bureaus of Construction and Repair and Steam Engineering of the Navy and with the Air Service and Bureau of Ordnance of the Army, and for the completion of many projects which will yield information useful in peace as well as war. Recognition of the fact that the Forest Service is an authoritative source of information on forest products and their uses has put the office in a position to render considerable assistance to various departments.

FOREST INVESTIGATION.

Under "forest investigations" are included a wide range of studies. Some of them have for their purpose better knowledge as to the amount, character, and distribution of our present forests; others concern the demands made upon them for the supply of material of various kinds, probable future demands, and the methods of utilization; and still others seek to make possible better methods of utilization and the most beneficial contribution of our forest resources to the public welfare, through investigations basic to the successful practice of forestry. The studies are therefore partly economic and industrial, in which case they have to do largely with the gathering and interpretation of statistics of production, consumption, present timber stands, and similar matters, and partly woods studies of all the factors which control or affect forest establishment, renewal, composition, rate of growth, and character of material produced.

During the past year the forest investigations have been chiefly those connected with war activities and with the completion of the

work started during the war. Many such investigations which were in their midst when hostilities ceased called for completion because of the applicability of their results in the post-war period. Thus the study of the amount of black walnut available for airplane construction and for gunstocks was completed, and a publication prepared dealing with supplies, growth, and management of this valuable species. A summary report was also prepared of the available supplies of the kinds of timber most likely to be used in aircraft construction during peace time. The study of supplies of the most important timber species has furnished a good deal of knowledge of our timber resources which have distinct value as a basis for shaping measures aimed to secure perpetuation of these supplies, pending provision for a complete timber inventory such as is fundamental to the working out of a sound, thoroughly intelligent forest policy for the Nation. The requirements of the Government for forest products, together with the control of production for needs of the country not directly connected with the prosecution of the war, gave a more accurate conception of the broad situation in which we are placed regarding forest products. This, together with inquiries as to the timber situation in foreign countries, afforded a clearer perspective of how far our own forests can be expected to meet future domestic and foreign needs.

A few investigations were undertaken having directly in view the meeting of postwar problems. Because of the importance of Sitka spruce for aircraft production, a study was undertaken of its growth, yield, and management.

Because of the added importance, in view of renewed agitation of the national need for the practice of forestry on private lands and of a comprehensive program for securing the perpetuation of our forest resources through combined public and private action, of accurate data as to the growth and yield of the different types of forest and the costs that may be involved in securing forest replacement, many field measurements were restudied in the light of recent experience and new data were accumulated. While the facts available are sufficient upon which to base a plan for inaugurating a general policy, the actual carrying out of such a policy will demand the prosecution of forest studies more comprehensive and far more detailed than those hitherto undertaken if the plan is to be made to work fully.

Some of the fundamental prewar studies, such for instance as the relation between distribution of the different forest types and the climatic and soil factors that control them, the importance of farm woodlands in the economic management of the farm, studies of the physical, chemical, and biological properties of seed, studies of the causes of forest fires and the liability of different forest types to them, have been renewed and are to be pushed with vigor to completion. As a partial provision for meeting the need for fuller information relating to the proper handling of forests, a comprehensive scheme for forest investigation in cooperation with States and forest schools has been developed.

REPORT OF THE CHEMIST.

C. L. ALSBERG, *Chief*.

As last year was a year of readjustment within the bureau to meet the demands for assistance made by the Government's war machine, so this year has been one of return to the normal. During the war so much unusual work was required of the bureau that its momentum was temporarily checked, and it had to be content to keep the regulatory work as nearly as possible up to its prewar level. It could not hope to forge ahead. Since the armistice was signed, the bureau has gradually regained its prewar acceleration, with the result that, though four months of the year were war months, and though the armistice did not by any means halt work for the war agencies or make it possible to recruit the bureau's force up to its normal strength, nevertheless 1,133 recommendations for criminal prosecution and 1,052 for seizure alleging violation of the Food and Drugs Act were sent to the Solicitor—by far the largest total for any one year in the history of the enforcement of the Food and Drugs Act. This is not to be taken to mean that the war has lowered the ethics in this country of the food and drug producing industries as a whole, although it has increased sophistication and misbranding in certain special directions. It merely shows that the bureau's regulatory force is gaining in efficiency as it gains in experience, and that the gradual reorganization of the bureau, the evolution of which has been recorded in its reports from year to year, is bringing results.

While the regulatory force of the bureau, despite the depletion of its personnel, is performing a greater volume of work than ever before, the constructive research work has not yet returned to normal. Partly completed war research problems have had to be rounded out, that the time and effort originally expended upon them might not be wholly lost. Moreover, the lure of high salaries is stronger than ever, so that there has been a heavy drain upon the bureau's force through the passing of men from it into the industries. The totally inadequate salaries offered by the Government have made it impossible to fill suitably the gaps thus created. From July 1, 1917, to June 30, 1919, of the war period, the separations from the service, not including men who entered the military service, have been of the technically trained staff 39 per cent of the prewar strength of the bureau, of the clerical staff 68 per cent, and of the staff of laborers, mechanics, messengers, and the like, 90 per cent. The total separations from the whole bureau, the so-called "turnover," including men furloughed to enter military service, for the two-year period, has been 72 per cent, and there is no indication that conditions are improving. It is obvious that service in the bureau must be made more attractive, especially in its financial aspects, if such efficiency as the Bureau of Chemistry has been able to achieve in the past is to be maintained.

Nevertheless, the momentum of the bureau's research organization has been sufficient to produce a larger number of publications than ever before. There were issued nine department bulletins, two department circulars, two circulars of the office of the Secretary, and

one yearbook article. In addition, the results of more than 75 investigations were made public, and those of more than 25 are now in press. The experimental work upon a number of other investigations has been completed. Thirty-five applications for patents were filed, of which 14 were allowed, 6 disallowed, and 15 are pending.

Naturally the work demanded of the bureau by other branches of the Government has lessened since the armistice; but its volume is still considerable. There is every indication that, inasmuch as the war brought to the attention of other branches of the Government the services the bureau is capable of rendering, such collaborative work will never diminish to the prewar volume. It is essential, therefore, that adequate funds for such collaborative work be provided. Moreover, the growth of the bureau in the last 10 years has been such that the quarters available in Washington have long been inadequate, and if its work is not to be progressively crippled, suitable quarters must be provided.

ENFORCEMENT OF THE FOOD AND DRUGS ACT.

DOMESTIC FOODS AND DRUGS.

One thousand and fifty-two recommendations for seizure and 843 recommendations for criminal prosecution were made to the Department of Justice, through the Office of the Solicitor. Table 1 gives a list of the classes of products on which action was recommended to the Solicitor, and also the distribution of the recommendations among the various types of products.

TABLE 1.—*Recommendations of action on alleged violations of the Food and Drugs Act transmitted to the Solicitor.*

Product.	Crim- inal actions.	Seiz- ures.	Product.	Crim- inal actions.	Seiz- ures.
Beverages, extracts, flavors.....	21	15	Lard and lard substitute.....	2

Glycerin.....		1	Total.....	1,133	1,052
Jam, jelly, and marmalade.....	4	6			

Examination of Table 1 shows that action was recommended most frequently against shipments of patent medicines, crude drugs and pharmaceutical preparations; of mineral waters and nonalcoholic beverages; of shell eggs and egg substitutes; of dairy products; of gelatin; of olive oil; of oranges and tomato products; of sea foods; of cacao products; of vinegar; and of stock feeds.

In the patent medicine cases, it was alleged usually that they were misbranded as to therapeutic claims under the Sherley amendment. In the case of the crude drugs and pharmaceuticals it was usually alleged either that they did not comply with the requirements of

the United States Pharmacopœia and were not labeled to indicate wherein they differed from the standard of the Pharmacopœia, or else that they were otherwise misbranded or adulterated.

In the mineral water cases it was alleged, as a rule, that they were either polluted or misbranded as to therapeutic claims under the Sherley amendment, or both.

The expansion of the nonalcoholic beverage industry has made necessary a close supervision of this class of products. Among the various kinds of violations alleged the most common are based on the representation by the manufacturer that the products consist in whole or in part of fresh fruit juice, when, in fact, they contain only some organic acid and an artificial flavor. Some of these products were found to contain saccharin substituted in whole or in part for sugar.

The work on shell eggs was in the nature of a follow-up campaign of the action taken in previous years and described in the Report of the Chemist for 1918. The eggs arriving in the market continue to improve in quality. The action against egg substitutes is the outcome of the work inaugurated and described last year.

The investigation of dairy products was designed to continue the supervision of evaporated and whole milk received in interstate or foreign commerce. In addition it was found that the high price of butter stimulated its adulteration with water or salt, or both, so as to lower the fat content. Much attention has been devoted to putting a stop to this practice.

The work upon gelatin was a continuation of that described last year to suppress the sale of glue as edible gelatin.

The olive oil cases were brought in conformity with the campaign inaugurated in 1918 to prevent the adulteration with other edible oils of olive oil, which is still practically unobtainable from Italy, although it can be secured from other Mediterranean countries, notably Spain. In consequence, much Spanish olive oil of excellent quality has been misbranded as Italian oil, a practice which it has been attempted to abolish.

The work upon oranges, necessitated by the disastrous frost of last winter, was designed to prevent the sale of frozen fruit. Frozen oranges should be used for the preparation, near the point of production, of jams and preserves, for which they seem suited if used promptly.

While a number of cases have been made against tomato products, the quality of these products as a whole continues to improve vastly. The adulteration of canned tomatoes with added water is becoming rare, and less tomato pulp made from partially moldy or fermenting stock is being produced. Assistance continues to be rendered by the experts of the bureau to manufacturers through personal visits.

The work upon sea foods was confined largely to the adulteration of oysters and scallops with water, termed "soaking" by the trade, the slack filling of cans with shrimp, and the prevention of the sale to the consumer of stale or tainted canned salmon. The latter project occupied more of the time of the regulatory force of the bureau than any other, since it involved the examination in detail of the vast surplus stores of canned salmon held by the Army before they were permitted to be turned back into the ordinary channels of trade.

The cases upon cacao products dealt principally with the adulteration of cocoa with cacao shells.

The cases upon vinegar were of the usual type. A new method has been developed for the identification of waste apple products vinegar by means of which it is hoped that the traffic in this variety of vinegar may be controlled and forced on to a legitimate basis.

The cases against stock feeds comprised the usual types of adulteration and misbranding reported from time to time in previous years. Much attention was paid to rice mill by-products, especially the adulteration with rice hulls, and data were obtained upon the conditions prevailing in the rice mills of the Pacific coast and upon the use of lime in rice milling. It was also found that, owing to the difference in price between bran and shorts, certain manufacturers were selling finely ground bran as shorts.

Of the 1,019 cases of all kinds reported to the department as terminated in the courts during the year, 258 alleged false and fraudulent labeling of medicines, 22 alleged similar misbranding of veterinary remedies, and 56 alleged adulteration or misbranding of stock feeds. All in all, 3 cases were reported as decided unfavorably to the Government.

Among the cases terminated was the bleached flour case which was pending at Kansas City, Mo. (N. J. 6380). The libel was amended to strike out the allegation to the effect that the flour contains an added deleterious ingredient which might render it injurious, in view of the experimental work of the bureau which did not indicate that the allegation was tenable under the interpretation of the law by the U. S. Supreme Court (N. J. 3398). The claimant then withdrew appearance and answer, and a default decree of condemnation and forfeiture was entered as to the remaining allegations in the libel.

Publication has been made of two judicial decisions of interest, involving interpretation of the law. The U. S. Supreme Court, in a judgment reported in Notice of Judgment 6308, affirmed judgment of the lower courts against Oscar J. Weeks, doing business as O. J. Weeks & Co., in connection with the misbranding of an article labeled "Special Lemon, Lemon Terpene, and Citral." A salesman of the defendant in offering the article for sale represented it as lemon oil, which it was not. The defendant upon appeal insisted that under the statute the question whether an article is misbranded turns entirely upon how it is labeled when it is shipped, regardless of any representations made by a salesman in offering it for sale. The U. S. Supreme Court, however, held that the statute specifies and defines at least two kinds of misbranding, one where the article bears a false or misleading label, the other where it is offered for sale under the distinctive name of another article. The two are quite distinct, a deceptive label being an essential element of one but not of the other. The court accordingly ruled that testimony respecting the representations of the defendant's traveling salesman was rightly admitted in evidence and submitted to the jury.

The case reported in Notice of Judgment 6362 is one under the Sherley amendment to the Food and Drugs Act, alleging misbranding of "Dr. J. H. McLean's Liver and Kidney Balm." The Court of Appeals of the Eighth Circuit reversed a judgment of conviction in the lower court because of error in the instructions of the court, and a new trial was awarded. In the instructions to the jury on the

question of the fraudulent character of the statements made by the defendant regarding the article, the court inadvertently said that "one who makes a false statement not knowing whether it is true or false is as guilty of wrong as the man who makes a false statement knowing it is false." The Court of Appeals held this portion of the charge was erroneous, as it permitted the jury to find that these false statements were fraudulent although the defendant honestly believed them to be true.

Two hundred and two of the cases reported as terminated were instituted by 38 different State and city agencies, either independently of or in cooperation with the Bureau of Chemistry. In 1916 there were but 35 such cases instituted by but four collaborating agencies. This very great increase illustrates the growing interest of State and city officials in the Federal act as a supplement to city and State food and drug laws. A rather unusual form of cooperation is found in the enactment by the State of California of a law forbidding the sale of arsenic-bearing sulphur for use in the production of food products. This followed the publication by the bureau of a report upon the arsenic content of sulphur from different sources.

To supersede Circular 19, Office of the Secretary, Circular 136, Office of the Secretary, "Standards of Purity for Food Products," was issued. The service and regulatory announcements published during the year contained 25 opinions and 250 notices of judgment. The following food inspection decisions were issued:

No. 177. Soda Water Flavors and Soda, Soda Water.

No. 178. Milk and Cream.

No. 179. Amending Regulation 29, Which Relates to Marking the Quantity of Food in Package Form.

No. 180. Colors in Food.

Nos. 177 and 178 are based upon the recommendations of the Joint Committee on Definitions and Standards.

No. 179 changes the exemption of small packages from those containing 2 ounces or less to those containing one-half ounce or less. This was done to prevent, in so far as existing legislation will permit, deception through the slack filling of small packages, such as 5 and 10 cent packages of spices. To protect the consumer more fully than is possible under existing statutes from fraud through the slack filling of packages, or the use of containers deceptive as to the amount of food in them because of their shape or dress, the department has recommended to Congress an amendment to the Food and Drugs Act. Moreover, independently of or in connection with other charges, consideration has been given to more than 1,000 cases alleging that the net weight either was not stated on the package or else was wrongly stated. Also numerous investigations have been undertaken to determine the variation in the quantity of the contents of packages of food as the result of the process of packing, as well as from shrinkage in storage and transportation. Such investigations are necessary for the effective enforcement of the net weight amendment.

A very extensive investigation, conducted through two seasons in various sections of the country, to determine the proper fill of cans of fruits and vegetables was carried to a successful conclusion. Based upon the results of this work, announcements of weights which are representative of properly filled cans have been

made in the case of peas, unpitted cherries, wax and refugee beans, and peaches.

Food Inspection Decision 180 removed from the list of permitted colors certain ones which had been found unsuitable.

The number of pounds of straight dyes for which certification was asked during the year is as follows: Amaranth, 36,753; Butter Yellow, 3,802; Butter Yellow AB, 333; Erythrosine, 732; Indigo Disulfo Acid, 1,317; Light Green SF Yellowish, none; Naphthol Yellow S, 905; Orange I, 17,142; Ponceau 3 R, 11,832; Sudan I, 2,041; Tartrazine, 38,295. Certification was also asked for 4,750 pounds of re-packed straight dyes and 97,241 pounds of color mixtures.

Table 2 gives the distribution of the official samples examined by the various field stations. In addition, thousands of shipments were examined, hundreds of which involved a preliminary laboratory examination not reported in the table.

TABLE 2.—*Report of field stations for year ended June 30, 1919.*

A great deal of assistance has been given the Post Office Department in connection with the exclusion from the mails of patent medicines, alleged therapeutic devices, and similar materials, involving work on the part of the bureau very similar, so far as laboratory operations are concerned, to that carried on in the enforcement of the Food and Drugs Act.

IMPORTED FOODS AND DRUGS.

During the fall of 1918, and particularly the three or four months following the signing of the armistice, owing in part to embargoes

and to the restriction of imports by the War Trade Board, imports were rather less in volume than at any other previous period. This was more noticeable in the case of food products than in the case of crude drugs, which have been less restricted and have been shipped from original sources to a greater extent than formerly. Disorganization of trade and of shipping, giving rise to delays, has caused many shipments to arrive in a more or less moldy condition. As a result of this disorganization, goods have been shipped before they were properly cleaned, particularly fennel, anise, cumin, caraway, fenugreek, and ajowan seeds, and thyme, savory, sage, and marjoram leaves, which in most instances have been released after proper cleaning. Goods in part moldy have been released after proper sorting and conditioning when this was practicable. A number of shipments of gum karaya, a product recently imported in large quantities, have been released after proper cleaning to remove excess bark or dirt. A chemical method was developed this year for the examination of this gum after grinding and conditioning. Not a few shipments of anise seed have been detained because they were mixed with an appreciable percentage of exhausted seed. In a few instances the poisonous leaves of *Coriaria myrtifolia* have been found in marjoram leaves. Substitution of crude drugs for others better known or for official species has not been uncommon. The following may be noted: Japanese aconite (*Aconitum fischeri* Reich.) for aconite (*Aconitum napellus* L.; red Jamaica or native Jamaica sarsaparilla (*Smilax utilis* Hensley) and the common brake (*Pteris aquilina* L.) for sarsaparilla; *Inula* species and an unidentified product from Mexico for arnica flowers (*Arnica montana* L.); Mexican orizaba root (*Ipomoea orizabensis* Leden.) for jalap (*Exogonium purga* Benth.) and for scammony (*Convolvulus scammonia* L.); Asiatic licorice (*Glycyrrhiza uralensis* Fisch.) for licorice; *Ballota hirsuta* Benth. for horehound (*Marrubium vulgare* L.); Egyptian henbane (*Hyoscyamus muticus* L.) for henbane (*Hyoscyamus niger* L.); *Arum maculatum* L. for *Colehicum autumnale* L.; Egyptian stramonium (*Datura metel* L.) for stramonium (*Datura stramonium* L.); *Ionidium* species for ipecac (*Cephaelis ipecacuanha* Rich.). Maracaibo bark was invoiced as cinchona bark, Peruvian bark, and cascarilla bark.

In other instances official drugs, such as aconite, belladonna, calisaya bark, and hyoscyamus, have been found deficient in alkaloid or active principle. In the case of substitutes or drugs deficient in active principle which may have some legitimate use, the bureau has felt that release on relabeling alone would not effectively prevent the goods from filtering into the channels of trade and being sold ultimately as the official product. A public statement through the service and regulatory announcements has therefore been made that release in such cases will be conditioned not only on proper relabeling but also on definite information that the goods will be manufactured by a specified firm into products for which their use is approved.

Special attention has been given to medicinal preparations bearing statements of therapeutic or curative effect. The printed matter used with each preparation has been carefully reviewed by the bureau's medical staff in Washington, with a view to exhibiting a uniform and consistent attitude toward all such products. Copies of the comments made, with information regarding the labeling,

have been transmitted on cards to all the port stations, thereby insuring perfectly uniform action. A distinction has been made between products intended for sale to the general public and those intended for physicians' use which are so labeled as not to affect the general public, properly confining all statements as to therapeutic use to an inclosed circular, leaving the outside label entirely free from such statements.

During 1918 many shipments of dried-egg products, yolk and albumen, coming from China, were found to contain notable quantities of zinc or zinc compounds. Such contamination occurred because these products were dried in zinc or zinc-lined trays, or, in some instances, in large plants, on zinc belts. During 1919 the shipments of yolk, some of them representing large lots manufactured by the spray process, have been found practically free from zinc. In the early part of the year several shipments of albumen were detained because of the presence of zinc, but during the latter part of the year a number of shipments, mostly small in amount but from a number of different manufacturers, have been found satisfactory. This would indicate that several firms in China have so changed their methods of manufacture that they can supply goods free from zinc, and will shortly be able to meet the demand for dried egg albumen and yolk, used in increasing quantities by bakers and manufacturers of bakers' supplies.

The last few months of the year saw the beginning of the resumption of normal trade in foods, notably olive oil, which had been subject to embargo in most countries. Large quantities, almost sufficient for normal demand, have come from Spain, and have caused the price to drop to nearly normal figures. In the past, Spain has furnished directly comparatively little olive oil to this country. The bureau's inspection has shown no instances of adulteration. The first few shipments have also been received of those particular foodstuffs from England, France, and Italy, that normally are imported in large quantities, but which ceased to come in during the last two years of the war. The first shipment of Smyrna figs received since the war began arrived during the last month of the year.

SUGARS, SUGAR DERIVATIVES, SIRUP.

Processes for the preparation of the sugar xylose, of gum industrially valuable as an adhesive, and of other useful substances from corncobs have been patented and made available to the public. Development work now being performed upon these processes offers a prospect that in time a new industry utilizing corncobs, a by-product heretofore largely wasted, may be established. As such an industry would make xylose available in large quantities, studies on the utilization of this hitherto rare sugar have been undertaken. A relatively simple process for its conversion into gulonic lactone, which might be useful commercially, has been patented and published. Moreover, a large series of bacteria has been found capable of fermenting xylose, to form certain products which may be of value industrially.

Data on the occurrence of the rare sugar melezitose in a manna from the Douglas fir and on the crystallography and optical properties of three aldopentoses have been published. Papers upon the

crystallographic properties of melezitose, upon the amide of α -*D*-mannoheptonic acid, and upon the rotatory powers of the amides of several α -hydroxy acids of the sugar group are in press.

The distribution of pure sugars, especially for use in bacteriological research, was more extensive this year than heretofore, varying amounts of 19 different pure sugars having been sent out.

The curtailment of distilling and brewing together with the war-time restrictions placed upon the consumption of sugar, seems to have stimulated the production of barley sugar or maltose, as well as that of maltose sirup. Since the extension of the uses of such material is a matter of some interest to the producer of barley, practical studies on the use of maltose sirup in candy manufacture have been undertaken. Preliminary results indicate that perhaps large quantities of maltose sirup can be employed in this way.

The project on the production of a uniform cane sirup that will neither ferment nor crystallize, which had reached such a stage that the problem was in the main how to introduce and cause to be used the processes devised in the bureau, has received a setback because yeast, necessary in these processes, is now obtainable only with difficulty. A search for substitutes for yeast has therefore been made, and preliminary results justify the hope that certain molds which can be grown easily and cheaply may form sufficient of the enzyme invertase to make it possible to use them instead of yeast for this particular purpose.

The bureau has cooperated with the Louisiana State Experiment Station in the study of the deterioration of raw sugars caused by the action of molds. In the preparation of cellulose acetates and their study, undertaken for the Bureau of Aircraft Production, some new cellulose compounds were prepared. This work has been closed.

FATS AND OILS.

Department Bulletin 769, "The Production and Conservation of Fats and Oils in the United States," giving a digest of the data collected during 1917 and 1918 by the U. S. Food Administration and the Bureau of Chemistry, was issued. This is perhaps the first complete and critical survey of the fat and oil industry and traffic of any country, and as a consequence the demand for the bulletin has been very great. A supplement containing the revised statistics up to January, 1919, is now in press. Hereafter the Bureau of the Census will collect the production, importation, and exportation figures on fats and oils, and issue them in quarterly reports.

The examination of tomato-seed oil has been completed, and the data thus secured submitted for publication.

A survey of the industrial recovery of wool grease has demonstrated clearly the necessity for a systematic investigation, to the end that less of this valuable material be wasted in the process of scouring wool.

CHEMISTRY AND NUTRITIVE VALUE OF PROTEINS.

The physico-chemical examination of gelatin has led to the publication of two articles entitled, respectively, "The Mutarotation of Gelatin and Its Significance in Gelation" and "The Effect of Hydrogen Ion Concentration on the Liquefaction of Gelatin," and to the

preparation of a third, entitled "Determination of the Jellying Power of Gelatins and Glues by the Polariscope," which proposes a method for testing gelatins and glues based upon changes in rotatory power.

The basic amino acid, lysin, which is believed to be an essential ingredient of diets capable of supporting growth, was discovered in hordein, the principal protein of barley.

A summary of the work on the proteins of the peanut and a preliminary announcement of the value of peanut flour in wheat bread has been presented. A loaf made from wheat flour with a small admixture of peanut flour and salts furnishes a diet that is biologically complete, is properly utilized by animals, and maintains normal growth. Even smaller amounts of soy-bean meal will give similar results.

The hydrolysis of stizolobin, the globulin of the Chinese velvet bean, *Stizolobium niveum*, has been completed. Two and one-half per cent of hydroxyglutaminic acid and from 9 to 10 per cent of aspartic acid were obtained from it. Rats fed upon a diet containing as the sole source of nitrogen the protein of the Georgia velvet bean grew normally to maturity. Further work is necessary to determine why the bean itself does not sustain growth. As has long been known, the globulin of the navy bean will not support normal growth. The bureau has discovered that if cystine be added to such a diet this protein will support growth. Moreover, normal growth can be obtained upon a diet containing navy beans to which cystine has been added. It also appears that the nutritive value of the globulin is somewhat improved by heating the protein in water. These observations are so suggestive that similar work upon other species of beans will be begun to determine if they, too, are deficient in cystine.

The data showing that coconut globulin contains all of the basic amino acids necessary to growth and that it, as well as crude coconut press cake, is capable of supporting growth, have been presented. It was subsequently found that mixtures of certain corn feeds with coconut press cake produce normal growth, which indicates that the coconut press cake contains sufficient water-soluble vitamine when the diet consists of equal amounts of the corn feed and the press cake. These findings justify the opinion expressed in the Report of the Chemist for 1918 that it is extremely desirable to retain in this country the copra-crushing industry which developed during the war.

SEA FOODS.

Bulletin 740, "A Study of Some of the Chemical Changes Which Occur in Oysters During Their Preparation for the Market," has been issued. It has been discovered that zinc, like copper, is invariably present in oysters, and probably in other mollusca. No relation could be traced between the zinc content of oysters and that of the waters from which they were taken. The data upon which these conclusions are based have been published. At the request of the Bureau of Fisheries a study was made of trade-waste effluents at Bridgeport, Conn., and West Point, Va., to determine the influence of such effluents upon the production of oysters in these localities.

Analyses have been made at various seasons of Pacific coast fishes, the food value of which is not known, and the results will be pub-

lished when another season's work has been completed. Information on the preservation of Pacific coast sardines by smoking has been disseminated, and a publication on the preparation of salacchini will soon appear. The project to develop methods for the preservation of Pacific coast fish will be discontinued because funds are no longer available.

Bacteriological examination has shown that, as reported last year for Maine sardines, and published this year, the intestines of salmon and certain other fish that are not feeding are practically sterile. Evidently in the spoilage of such fish the bacterial invasion is from the skin inward, not from within the gut outward. Hence knowledge of the resistance offered by the skin of various kinds of fish to invasion by bacteria is of importance in determining the best methods of handling each species. Preliminary data indicate that the skin of different species varies appreciably in this respect. It follows, moreover, that in handling and transporting many kinds of fish it is of the utmost importance to avoid any injury or bruising of the skin.

The changes that take place in the flora of fish during shipment to market or cannery and during cold storage have also been studied, especially the microorganisms found on Pacific salmon. A related inquiry upon an aerobic spore-forming bacillus from canned salmon has been prepared for publication. In addition, search has been made for satisfactory chemical methods to detect spoilage of salmon, and to learn the conditions under which the fish may become stale in the cannery before being packed. While satisfactory progress has been made, at least another year will be required for the completion of the project.

A paper on the determination of the hexabromid and iodine values of the oil of salmon as a means of identifying the species in the canned product has been published.

Progress has been made in the study of the best methods of transporting fresh fish. Some shippers have been induced to substitute for barrels used as shipping containers 100-pound boxes, 30 inches long by 15 inches wide by 15 inches deep. In such boxes the lower layers of fish are not subjected to as much pressure and bruising as in barrels or when shipped loose with ice in the bottom of refrigerator cars. Study has shown that in barrels the pressure upon the lower layer of fish may be so great as to produce a shrinkage of over 8 per cent in five days, whereas the shrinkage in the top layer is practically negligible.

Studies have also been made on the chilling of fish to prevent their rise in temperature while being transported in warm climates to the refrigerator. The preservation of fish by freezing, and especially the freezing of fish in chilled brine, has been investigated. It was determined that in the latter process the brine penetrates through the skin for a short distance.

A large fund of information concerning the commercial handling of fish intended for freezer storage, and on the equipment of fish freezers has been obtained. It has thus been possible to give advice to operators and prospective builders of fish freezers. Many persons in the various branches of the fish industry were given information. Producers on the Maryland, Virginia, North Carolina, and Florida coasts were instructed in the packing of fish and loading of refriger-

ator cars. In cooperation with the Bureau of Fisheries, the bureau supervised the handling and freight transportation of fish in car lots from the producing section in Florida to Savannah, Ga., Louisville, Ky., Nashville, Tenn., and Indianapolis, Ind. Approximately 400,000 pounds of fish were transported in this way, and in consequence the market for Florida fish was greatly extended. Moreover, in cooperation with the Bureau of Fisheries, analyses of various kinds of salt were made to determine the characteristics of those most suitable for salting fish.

POULTRY AND EGGS.

The following publications have been issued: Department Bulletin 391, "Accuracy in Commercial Grading of Opened Eggs;" Department Bulletin 702, "Efficiency of Commercial Egg Candling;" Department Bulletin 775, "Commercial Preservation of Eggs by Cold Storage;" and Department Circular 25, "Points for Egg Buyers."

A material diminution in the breakage of eggs during transportation resulting from faulty loading and stowing of freight cars was brought about through cooperation with the Railroad Administration. Employees of the Railroad Administration were detailed to the Bureau of Chemistry, where they received instruction in proper methods of loading and stowing eggs in freight cars. Whenever cars were received at terminals with the loads in a badly damaged condition, these employees of the Railroad Administration paid personal visits to the shipper for the purpose of instructing him how properly to load cars and avoid more damage in future shipments.

DAIRY PRODUCTS.

Much attention has been given to the development of analytical and microscopical methods for distinguishing from fresh milk remade milk, produced by combining mechanically skim-milk powder, water, and butter fat. No wholly satisfactory microscopic method has been devised. Physico-chemical methods have been found successful only under certain conditions. Physiological analytical methods have also been successful under some conditions, but it still remains to be determined whether any of these methods or any combination of them will prove universally applicable.

An extensive investigation designed to furnish information for use in the enforcement of the Food and Drugs Act has been undertaken to develop methods for the detection of spoilage in cream and butter. The flora of the various types of old cream, the products of the action of microorganisms that may be present in such cream, the effect of neutralizing and pasteurizing it before churning, the production of butter from it, and the possible occurrence of the products of the metabolism of microorganisms in the butter are being studied. This investigation is conducted mainly in the field, in cooperation with the creameries. As such work can be done in a satisfactory manner only during a portion of the year, it is probable that it will be necessary to continue it through several seasons.

BEVERAGES.

An article entitled "Composition and Food Value of Bottled Soft Drinks" was published in the Department Yearbook for 1918.

The work begun last year upon the substitution of other sweetening agents for sugar as a means of sugar conservation was continued. Three articles on the subject, published in the trade journals during 1918, were widely copied. Three other articles were added this year, "Refiners' Sirup for Bottlers," "Soft Drinks without Sugar," and "Substitute Sirups for Soft Drinks." With the cooperation of the United States Food Administration, many thousands of copies of a brief résumé of the subject were distributed, and the information given in person at meetings of the trade. A valuable service was thus rendered the soft-drink industry, and many bottlers who were unable to secure sugar were saved from disaster. Some of the substitutes proved to have such merit that they probably will remain in permanent use.

Studies have been conducted upon soda flavors and upon the flora of sweetened nonalcoholic beverages. An article has been prepared upon the longevity of bacteria in commercial bottled water.

CITRUS BY-PRODUCTS.

The citrus by-product project was organized on its present basis in 1914, the object being to develop first upon a laboratory, and later upon a commercial scale methods for the manufacture of salable products from citrus fruit not suitable for shipment as fresh fruit. Minor defects, such as small bruises or punctures from thorns, gravel, or rough boxes, destroy the shipping value of fruit, as such defects offer points for infection to various bacterial and fungous growths which cause decay. Fruit that is too small or too large, unsightly or misshapen, has also a doubtful shipping value. The amount of waste fruit averages from year to year about 3 per cent of the total crop.

The by-product laboratory at Los Angeles has been studying the utilization of cull oranges in making stable products. Marmalade, marmalade stock, juice, vinegar, and candied peel are possibilities in this direction. Methods for the production of all of these, except juice, have been developed, and either have been given to the public or are now ready for publication. Candied peel and juice of excellent quality can be made from grapefruit, and methods for their production have been devised and given to the industry.

The existing methods for the manufacture of citrate of lime and citric acid have been improved and adapted to California conditions. They are now being used satisfactorily on a large commercial scale, and while there will always be unsolved problems, as in every chemical industry, the methods of manufacture of citric acid are sufficiently well developed to permit its manufacture from the raw product at a fair profit to the lemon grower.

When these investigations were begun there were but one or two struggling by-product companies in California, which were making no appreciable inroad into the enormous supply of cull fruit available. After a few years' work and the expenditure of less than \$100,000 this situation has materially changed. Four stable, going concerns, three of them privately owned, and one a cooperative growers' company, are now manufacturing lemon by-products. The total annual manufacturing capacity of these plants is over 1,500,000 pounds of citric acid, over 500,000 pounds of citrate of lime, and over 50,000 pounds

of lemon oil. Some 20 concerns may be said to be producing orange by-products on a considerable scale. The products consist largely of marmalade, about 50 per cent of which is produced by one cooperative company. Marmalade stock, jellies, and candied peel are also being made in smaller quantities. The total output of orange by-products for the present year will approximate 6,000,000 pounds. Proof of the advance which has been made since this project began is the increase in the price of cull fruit. Less than five years ago cull lemons could be had in large quantities at \$5 a ton; to-day advertisements appear in several agricultural papers offering from \$20 to \$25 a ton for the same material, in face of the fact that a larger quantity is now available. The same situation exists in the case of oranges. In former years \$5 would buy a ton of sound cull oranges; the price at the present time for sound culls is from \$20 to \$30 a ton.

The by-product laboratory has been in close touch with a great majority of the by-product manufacturers, advising them as to processes and assisting them in every possible way in establishing their business. No small amount of good has been accomplished in pointing out defects in proposed methods of operation, and much money and time has thus been saved investors and experimenters in this field.

Work upon the production of citrus by-products was also done in Florida during the year, and it is proposed next season to prosecute the Florida part of the project vigorously.

DEHYDRATION OF FRUITS AND VEGETABLES.

The special appropriation for dehydration did not become available till late in the fall, when the production of fruits and vegetables is small. The work that could be undertaken was therefore somewhat limited, and in consequence a considerable proportion of the funds available was not used. During the war a number of plants were constructed by private enterprise to dry fruits and vegetables for military purposes, but the majority of the products, while nutritious, were unattractive and inferior in quality. The bureau endeavored to investigate all the processes in use, in the hope of suggesting improvements whereby satisfactory dried fruits and vegetables might be produced, and a sound, permanent industry established. To this end all the larger plants were carefully inspected, and their processes studied under commercial conditions. Numerous conferences were held with manufacturers, all of whom exhibited eagerness to cooperate and to offer every facility to promote the work. Laboratory investigations were undertaken to compare the nutritional qualities of dried products with those of canned and fresh material. About 30 departments of home economics, mostly in the agricultural colleges, cooperated, thus making it possible to reach conclusions more speedily than could have been done had the work been confined to a single laboratory. Studies on the nutritional value of dried products were also undertaken at Johns Hopkins University and at the University of Rochester. On the whole, the findings have been quite favorable.

Studies have also been made to determine the best conditions for the storage of dried products, especially the most suitable types of containers, and an investigation of the flora of such products is in

progress. Bulletins bearing on the various phases of the dehydration work, now in preparation, should appear during the coming year. Two general addresses by those in charge of the work have been published, one of them as Office of the Secretary Circular 126, "Relation of Dehydration to Agriculture." The net result of the work has been of real practical assistance to the industry. Poor materials are disappearing from the market, and a few plants producing materials of excellent quality have become established.

In cooperation with a plant in South Carolina, an attempt was made by the bureau to produce sweet potato flour by the methods used with success in the production of white potato flour. The plant was operated for a few months, but the results were disappointing because of the very hygroscopic nature of the product which influenced unfavorably its keeping quality. The data will be published. The bureau has also been able to assist in the establishment of the white potato flour industry, which seems to be gaining ground. Data on potato flour and potato bread have been published.

Cooperation with the potato starch industry is in progress, looking toward the utilization of potato pomace, improvement of the methods for drying starch, the production of potato dextrin, and an increase in the capacity of the plants. Assistance was given to the Office of the Quartermaster General in the inspection and supervision of plants producing dehydrated vegetables for the Army.

FLOUR AND CEREALS.

Department Bulletin 701, "The Chemical Analysis of Wheat-Flour Substitutes and of the Breads Made Therefrom," has been issued, and a paper on the composition and baking value of the different sized particles of flour is in press.

As it was proposed during the year to import from Australia wheat badly infested with weevils, experiments were performed to determine the degree to which wheat may be heated in the attempt to destroy the weevils without affecting the quality of flour produced from the treated wheat. It was found safe to heat to 160° F., but not to 180° F., for 30 minutes.

Rice is one of the flour substitutes employed during the war which promises to continue to be used in baking. Baking experiments, therefore, were made with flour prepared from different varieties and grades of rice, polished to varying degrees. Fifteen per cent of rice and 85 per cent of white flour were used. No appreciable differences were found in the baking qualities of such mixtures, irrespective of the fineness of the rice flour used. As was to be expected, the color of the bread was influenced by the degree to which the rice had been polished.

Much attention has been given to the study of the spoilage of corn meal, with a view to determining the most suitable conditions for its storage. The spoilage produced by different organisms and the effect of the growth of such organisms on the composition of the meal, especially with relation to acidity and rancidity, have been investigated, in the hope that a sound basis may be found to estimate the degree of spoilage of corn meal and its fitness for food.

GRAIN MILL, ELEVATOR, AND COTTON GIN EXPLOSIONS AND FIRES.

The emergency demonstration campaign, conducted in cooperation with the Bureau of Markets, to conserve grain and flour by preventing explosions and fires was carried out in the manner described in the Report of the Chemist for 1918. Five thousand six hundred plants were visited and over 30,000 pledge cards signed by the owners, operators, and employees. A number of recommendations suggested to the companies as possible precautions against dust explosions were cheerfully adopted, and it is believed that these slight changes have assisted in reducing the loss in this country due to explosions and fires in mills and elevators. Not a serious explosion occurred in such a plant during the year. A very disastrous explosion did occur in a different type of plant, a starch works, 43 persons being killed and a number injured. This demonstrates clearly that the work should be extended to other dusty industries. As no funds were available to proceed with the work after the close of the fiscal year, and as the U. S. Grain Corporation desired that it be continued as a form of insurance for its own operations, arrangements were made to transfer the force engaged upon this campaign to the rolls of the Grain Corporation. The work will be continued by that corporation, the Bureau of Chemistry collaborating by furnishing general supervision.

The campaign to prevent explosions and fires in thrashing machines has been continued and extended to cover other sections than Oregon, Idaho, and Washington, to which it had hitherto been limited. In cooperation with the Bureau of Plant Industry and the Bureau of Markets, special attention was given to the development of the suction-fan installation to remove dust from thrashing machines, and an effort was made to determine the effect of its operation on grain cleaning and on the possibility of smut-spore collection and disposal in order to prevent the dissemination of the spores over surrounding land. Plant pathologists have expressed themselves as quite hopeful that the devices for the disposal of spores which have been designed and tested may prove of great service in the control of the smut of wheat.

The discovery that many of the fires in the cotton gins of the Southwest are due to static electricity reported last year was confirmed this year. The limited funds available made it necessary to confine this work, which was done in cooperation with the Bureau of Markets and the various State and insurance agencies, almost entirely to the State of Texas. Department Circular 28, "Cotton Gin Fires," issued during the year, was distributed among cotton ginners, insurance agencies, and others interested throughout the South. Though still unfinished, the work was closed at the end of the fiscal year, no appropriations being available thereafter.

DRUGS AND PHARMACOLOGY.

A series of researches upon crude drugs have been published under the following titles: "Commercial Viburnum Barks and Preparations;" "Karaya Gum, a Substitute for Tragacanth;" "*Ballota hirsuta* Benth., an Adulterant of Horehound (*Marrubium vulgare* L.);" "Piptostegia Root, *Piptostegia Pisonis* Mart, so-called Brazilian

Jalap;" "Botanicals of the Blue Ridge;" "*Conium maculatum* L., and *Aethusa cynapium* L., an Adulterant;" and "So-called Syrian Alkanet, *Macrotomia cephalotes*, D. C." Manuscripts have been submitted for publication under the titles: "*Santolina chaemacyparissus* L., an Adulterant of *Matricaria chamomilla* L.;" "The Structure of Bermuda Grass Compared with that of Triticum;" and "Some Effects of the War upon Crude Drug Importations."

Evidence has been obtained that the part of ipecac which is often referred to as "stems" consists largely of the underground part of the axis, more properly referred to as rhizome. The young and smooth roots at times may also be considered as stem, since they resemble the rhizome rather closely in appearance. These parts, evidently referred to by mistake as stem, were found to contain appreciable quantities of ether-soluble alkaloids. It appears quite probable that the problem concerned with the utilization of this now rejected but valuable part of the ipecac plant can be solved by modifying the definition for ipecac to read: "The dried roots and rhizomes * * *"

The optical crystallographic properties of the cinchona alkaloids have been determined, so that a new method for their identification, even when present in small amounts if they can be obtained in crystalline form, is now available. An inquiry into the occurrence of lead in pharmaceutical zinc oxid has been published. A paper upon the preparation of sodium-p-hydroxyphenyl-arsenate, an intermediate in the manufacture of arsphenamine, and one entitled "A Review of the American Patent Literature on Arsphenamine (Salvarsan) and Other Arsenicals" have been issued.

A new method for determining the toxic effect of various agents administered over long periods of time in small dosage has proved of service. Young rats are placed upon such a standard, adequate diet as has been introduced by Osborne and Mendel and by McCollum. To the diet the substance under investigation is added, and the growth curve of the young animals plotted. Disturbances of health usually become evident when such growth curves are compared with those of normal animals. It is hoped that by this method it may be possible to determine the lower limit of toxicity of many substances. Such an investigation upon cadmium, which during the war it was proposed to substitute in part for tin in solder and other alloys, has been completed.

An extensive study on the toxic action of gossypol, a phenol found in cotton seed, to which the poisonous action of some cottonseed meal has been attributed, is in progress. Complete information on this subject is necessary, in view of the recommendations now being made by various dietitians that cottonseed meal be used as food for man. The optical crystallographic properties of gossypol have been determined.

The description of a transparent celluloid renal oncometer or plethysmograph has been published.

The services of the bureau's experts were furnished the scientific division of the Shipping Board and the Tariff Commission, in connection with the consideration of drug and chemical products.

PLANT CHEMISTRY.

Seeds of about 40 individual plants of the mustards, *Brassica cernua* and *Brassica juncea*, grown in Illinois, have been examined

separately for essential oil. In general, the volatile oil content of these seeds was much above the average, reaching in some cases 1.5 per cent. Seeds of the varieties from which the largest yields of oil were obtained have been planted at Arlington, Va., for further study. Under the title "Capsaicin, the Pungent Principle of Capsicum," the results of the study of the constitution of the pungent principle of red pepper have been published. It has been possible to produce synthetically a series of substances of marked pungency.

A report on the results of a survey on the caffeine content of the North American species of the genus *Ilex*, under the title "*Ilex vomitoria* as a Native Source of Caffeine," is in press. Of the various species examined, only *Ilex vomitoria*, used since prehistoric times by the Indians for the preparation of a beverage, was found to contain caffeine.

Department Bulletin 773, "Chemical Analyses of Logan Blackberry (Loganberry) Juices," has been issued.

To further the educational campaign to improve conditions in the production of tomato products, which has been conducted for some years, a paper on "Factory Investigations on the Manufacture of Tomato Pulp and Paste" was printed in a trade journal.

Articles upon the determination of the distribution of nitrogen in certain seeds, upon the reduction of nitrates by seedlings, and upon the effect of lime upon the alkali tolerance of wheat seedlings have been published. Studies of pumpkin and squash seed have been completed.

At the request of the Bureau of Plant Industry, the acidity of the soil under certain special conditions was investigated.

For the Bureau of Biological Survey many samples of water from North Dakota lakes were examined to obtain information regarding the propagation of aquatic plants.

In cooperation with the Bureau of Markets, an extensive survey is being made on the composition of cotton seed from various sections of the country. In addition to the analyses made in the bureau, 60,000 analyses have been obtained from 27 other laboratories, and arrangements to obtain from these laboratories similar analyses of the 1918 crop have been completed. Studies begun some years ago to determine whether the oil content of a given sample of seed could be estimated from the density of the seed, or the weight per thousand, and the like, factors of worth in the evaluation of barley, have not yielded results of value.

FOOD FLORA, SPOILAGE, AND FERMENTATION.

References to the year's work upon the spoilage and the flora of specific articles of food are made elsewhere in this report, where such foodstuffs are specifically considered. The general investigations upon poisoning by spoiled food have been continued, and some of the results embodied in two papers entitled, respectively, "Toxin Formation by a Variety of *B. botulinus* when Cultivated Aerobically under Various Conditions: Its Possible Production in the Animal Body," and "Botulism from Canned Asparagus." In general, the results indicate that the strain of *Bacillus botulinus* isolated from the spoiled asparagus which produced fatal poisoning is capable of withstanding the temperature used in the processing of canned goods by methods in vogue for home canning or for commercial canning, that

the organism produces putrefactive decomposition, and that the principal safeguard against poisoning from such types of organisms as this lies in the scrupulous examination of every can of material to make sure that no spoiled food is included in the portions eaten.

The study of the molds used in the oriental fermentation industries has included several lines of experimentation. Soy sauce has been made according to the methods employed in Japan. Enzymic studies have been performed with a bran koji made with *Aspergillus Wentii* and various strains of *Aspergillus flavus*. The metabolism of this group of organisms has been studied, especially the chemical changes they produce in soy fermentation, and the formation of phenolic substances. A study of Chinese red rice as produced by the growth of *Monascus purpureus* has been prepared for publication under the title of "Laboratory Experiments on the Manufacture of Chinese Ang-khak in the United States."

In connection with the studies to improve the manufacture of pickles and prevent the losses that occur at present because of the softening of the pickles during storage, arrangements have been made with the Bureau of Plant Industry and with the Mississippi Agricultural College to study the fermentable sugar content of different varieties of cucumbers. Cooperation has also been maintained with manufacturers of sauerkraut, with a view to controlling the temperature of the kraut as it goes into the fermenting vat, in order to obtain more nearly the optimum conditions of fermentation than has hitherto been the case. A report on the use of pure culture starters in the preparation of sauerkraut has been issued. The work on the preservation of foods by fermentation and brining has been continued, and the information of value thus obtained has been transmitted to the States Relations Service for demonstration in the field. A report of the work is in manuscript form. A paper entitled "A Preliminary Report upon Some Halophilic Bacteria" has been printed.

The requests for cultures from the bureau's extensive and growing collection have been numerous, centering, in recent years, upon the citric-acid-forming group of molds, the cheese-ripening fungi, and those connected with the oriental fermentation industries. Many routine identifications of cultures were made for various investigators.

A communication was made upon the chemical analyses of bacteriological bouillons.

INSECTICIDES AND FUNGICIDES.

Department Bulletin 750, "A Method for Preparing a Commercial Grade of Calcium Arsenate," and a communication on plants used as insecticides, have been printed, while a paper describing the diagnostic characters of the field daisy, used as an adulterant of pyrethrum, is in press. Equipment to produce insecticides and fungicides on a semicommercial scale has been secured, to the end that ways and means to improve manufacturing processes and to devise new types of useful insecticides and fungicides may be investigated. In cooperation with the Bureau of Entomology, the possible value of war gases as insecticides has been taken up. Phosgen and cyanogen chlorid have been studied. The field men of the Bureau of Entomology have been assisted in the work of controlling the boll weevil.

CONTAINERS.

The bureau was invited to designate a representative to serve upon the Committee on Standard Specifications for Kitchen Ware, Mess Equipment, and Flat Ware for the Army. This led to the examination of 61 samples of enamel ware from 26 different American manufacturers. The test most frequently used was made by boiling 500 cubic centimeters of 4 per cent acetic acid, the strength of standard vinegar, in the vessel for half an hour. No antimony was dissolved from 17 samples obtained from 9 manufacturers. Thirty-four vessels, both white and gray ware, yielded to the solution from 0.5 to 2.0 milligrams of antimony. Lead was found in ware from only one manufacturer. Earthenware was then examined, and in some instances its glaze was found to yield to the acetic acid solution small amounts of lead.

Analyses have been made for the War Department and the War Industries Board of foil used to wrap food products and other materials. Some foil is pure aluminum, some is pure tin, while some contains lead and tin, with the tin varying from 1 to 30 per cent. Some of the composite foils appear to be alloys, while others consist of an inner layer of lead covered by two layers of tin. In most of the instances when foil containing lead is used a waxed paper wrapping is placed between the metal and the food product.

Except in the case of phosphorus matches, there are no Federal laws to protect the public against the presence of poisonous substances in articles of common use in the household. Many foreign countries have long had such legislation on their statute books.

Cooperation with the industry to ascertain what types of tin plate are most suitable for food containers has been continued. Special attention is being given to the best means of preventing the perforation of cans containing acid fruits. The results of the successful trial in a tin mill under ordinary conditions of hydrogenated oils in place of palm oil have been prepared for publication.

A paper dealing with the use of the impact tester for fiber board has been presented, and work was continued on the improvement of the water-resisting properties of fiber board for fiber containers, both by substituting other adhesives for silicate of soda and by using external treatments which will not interfere with the future use of the stock. A report on the various kinds of water-resistant baling papers was given.

COLOR INVESTIGATIONS.

The general plan of the color investigations which have been in progress in the bureau for but a few years was first fully discussed in the Report of the Chemist last year. This year it is possible to report specific results.

Work upon photosensitizing dyes was begun at the instigation of the War Department. The three important sensitizing dyes, pinacyanol, pinaverdol, and dicyanin, have been prepared and made available. Preparations of these dyes have been distributed to those requiring them, including photographic plate manufacturers and astrophysicists, who have reported them satisfactory. A new dye showing absorption further in the infra-red part of the spectrum than any other known dye has been prepared. It may prove of great value to

physicists. New processes for the manufacture of these photosensitizing dyes have been discovered and patent applications filed. Four papers upon the chemical properties of and the methods for producing these dyes and their intermediates and one upon their crystallographic and optical constants have been published. As it is now possible to establish in the United States this very small but scientifically extremely important branch of the dye industry, steps to bring this about are being taken.

The new method developed in the bureau for the production of phthalic anhydrid by catalytic air oxidation is in successful commercial use, and cooperation was begun with another manufacturer during the year. Certain theoretical laboratory investigations remain to be completed before a final report of the whole investigation can be published.

From cymene a new photographic developer has been produced and the process published. Studies upon the chlorination of cymene are in progress. A report upon the preparation of 2-chlor-5-6-dinitrocymene is ready for the printer.

The sulphonation studies have progressed to such a point that cooperation with the industry upon the sulphonation of benzene has begun. Observations of great interest, especially on the sulphonation of naphthalene, are in process of investigation. Reports have been prepared upon "Some Difficultly Soluble Salts of Certain Naphthalene Sulphonic Acids," and upon "A Method for the Qualitative Determination of Some of the Naphthalene Sulphonic Acids."

The laboratory and plant studies on the production of isopropyl alcohol and its oxidation to acetone, undertaken for the Bureau of Aircraft Production, have been completed. It seems probable that the process will prove of commercial value.

Papers have also been presented upon the following subjects: "Some Aspects of the Behavior of Charcoal with Respect to Chlorin;" "A Method for the Purification of Certain Azo Dyes;" and "The Catalysis of Some Vapor Phase Oxidation Reactions."

The laboratory under construction at Arlington for large-scale or semi-industrial operations, which was loaned to the Nitrate Division of the Bureau of Ordnance during the war, has been released to the Bureau of Chemistry and should be ready for occupancy during the coming year.

LEATHER AND TANNING.

Farmers' Bulletin 1055, "Country Hides and Skins," has been prepared in cooperation with the Bureau of Animal Industry and Bureau of Markets. Plans have been made to disseminate the information contained in this bulletin widely through the county agents of the States Relations Service, the distribution of posters, and the like, in the hope that the very great waste of valuable raw materials that now occurs because of lack of knowledge may be stopped. Papers on the waterproofing of leather, on the relative absorption of oils and greases by wet and dry leather, on the testing of materials for increasing water resistance of sole leather, and on the suitability of various solvents for the extraction of oils and greases from leather were presented at various meetings of technical societies. A farmers' bulletin on the care of shoes and harness is in preparation. Assistance has been rendered the War Department and the War

Industries Board in regard to the waterproofing of leather and the preparation of specifications for various kinds of leather, the Post Office Department on specifications for bag leather, and the U. S. Shipping Board. Methods for the tanning of alligator skins have been furnished the Indian Commission of the Interior Department, which contemplates the establishment of the industry among the Indians of Florida.

NAVAL STORES.

The final report on the production of naval stores, including gum rosin and gum turpentine, wood rosin and wood turpentine, and rosin reclaimed from batting dross, has been published, and put into the hands of producers, factors, dealers, and consumers of naval stores. This report shows the total production for the last season, stocks on hand at stills on March 1, 1919, and total shipments from stills during the period from April 1, 1918, to March 1, 1919. Reports have also been made of the stocks of rosin and turpentine in the hands of the consumers of naval stores and of the stocks in the storage yards at the principal points of distribution in the country. Assistance was given the Bureau of the Census in the preparation of the schedule for naval-stores statistics and of the lists of naval-stores producers.

Specifications on the properties, the sampling, and the laboratory examination of turpentine have been prepared and submitted to the Interdepartmental Committee on Paint Specifications for Government Bureaus. Much investigational work was required in this connection, because fresh virgin turpentine may not reach the minimum limits formerly set for specific gravity and refractive index, while turpentine taken from storage tanks in the South which have remained partly filled for a year or more may exceed the limits previously set for these constants.

In accordance with the practice of the past to place glass types for grading rosin at convenient points, a set of types has been deposited on loan with the secretary of the Chamber of Commerce of Cleveland, Ohio, for the use of consumers and dealers in that vicinity.

PAPER AND FABRICS.

Assistance in the preparation of specifications for paper has been given to the congressional Joint Committee on Printing, to the Post Office Department, and to the Treasury Department.

The study of the waterproofing, mildewproofing, and fireproofing of fabrics for farm use has been continued. A farmers' bulletin on waterproofing and mildewproofing for farm purposes, as well as an article on the general toxicity of soaps of heavy metals, alone and in combination, to fungi occurring on textiles, are in preparation. A paper entitled "Water Resistance of Fabrics" is in press.

Assistance has been given to the Office of the Quartermaster General and to the Chief of Staff of the Army on the preservative treatment of fabrics and on the repairing and waterproofing of tentage.

METHODS AND APPARATUS.

Methods have been published for the estimation of theobromin, of potassium guaiacol sulphonate, of citral, of mercury precipitated as mercuric zinc thiocyanate, of zinc precipitated as zinc mercury thiocyanate, of copper in insecticides, of zinc and copper in gelatin, of tyrosine in proteins, of the loosely bound nitrogen in eggs as ammonia, of the lower alkylamines in the presence of ammonia, of coumarin in factitious vanilla extracts, of iodine in mineral waters and brine, and of the acidity of grain extracts. Report has been made upon the use of benzaldehyde sulphite compound as a standard in the quantitative separation and estimation of benzaldehyde and benzoic acid, upon a method for the rapid analysis of mixtures of chlorinated toluene, and upon the use of thymosulphophthalein as an indicator in acidimetric titrations.

Methods are in process of publication upon the determination of bromide in mineral waters and brines, the estimation of monobromated camphor in migraine tablets, the use of kaolin in tannin analysis, the determination of water solubles in leather, the determination of caffeine, and the determination of the water resistance of fabrics. Certain other investigations upon analytical methods are referred to elsewhere in this report.

Descriptions of laboratory apparatus for rapid evaporation, and of a new type of volumenometer have been published.

The bureau's machinery for the examination of supplies purchased has been reorganized, and a paper on the general subject of laboratory apparatus was presented to the American Chemical Society.

REPORT OF THE CHIEF OF THE BUREAU OF SOILS.

MILTON WHITNEY, *Chief of Bureau.*

SOIL SURVEY.

The war did not make itself felt in a decrease of the work done by the Soil Survey before the spring of 1918. With no increase in the field staff the area covered in 1918 was greater than the year before. In 1919 the effect of the war was shown in a decreased area covered, which was a little more than 4,000 square miles less than the area covered in 1918. During the closing months of the fiscal year 1918 many members of the field staff entered the military service, reducing the effective force to about two-thirds its normal strength, at which point it was with difficulty maintained during the greater part of 1919.

Detail surveys were made during the year in 27 States. In 22 of these the work was done in active cooperation with State organizations. The area covered in these States amounted to 27,456 square miles. In five States 4,532 square miles of noncooperative work was done, the percentage of such work being slightly higher during 1919 than 1918. The total area surveyed in detail during the year was 33,988 square miles.

Reconnaissance soil mapping was confined during the year to one area in the High Plains section of western Texas. This area comprised territory of an extent of 6,085 square miles.

The total area covered by detailed surveys in continental United States up to June 30, 1919, amounted to 517,940 square miles.

The following tables give in detail statistics covering the operations for the last year and also a summary statement of the area surveyed from the beginning of the work in 1899 to date.

Notwithstanding the fact that the work of the Soil Survey is not directly concerned with production and that no funds were received from the emergency appropriation, a certain amount of work bearing on the prosecution of the war was done at the request of the War Department in connection with the constructing of the progressive military map of the United States. In large areas of the Coastal Plain section of the United States the base maps prepared by the Soil Survey were the most reliable maps in existence. All of the published maps of this region were used by the War Department and the base-map information contained in unpublished soil maps was compiled and turned over to the Corps of Engineers. In addition to this the areas for survey in Southern States during the winter of 1918-19 were selected, at the request of the War Department, in localities where there was greatest need of fundamental information. Placing the areas according to this plan was done in every case with the consent of the cooperating State concerned.

Individual areas surveyed and mapped during the fiscal year ended June 30, 1919.

DETAILED.

State.	Area.	Area surveyed.	
		Square miles.	Acres.
Alabama.....	Geneva County.....	257	164,480
	Houston County.....	445	284,800
	Marengo County.....	1 270	172,800
California.....	Brawley Area.....	315	201,600
	Grass Valley Area.....	12 114	72,960
	Shasta Valley.....	220	140,800
Delaware.....	Kent County.....	1 177	113,280
	Sussex County.....	416	266,240

Cooperative work with the Forest Service was carried on during the year in certain studies in Utah, Arizona, and in a number of Southeastern States. In the latter the work had especial reference to the relation of soil character to kind and character of forest growth. Information of this kind was desired in certain reforestation studies in the area of cut-over lands in the South. The work in

Utah and Arizona also was concerned primarily with the relation of the soil to the growing of forest trees.

The study of the soil conditions on the public lands, in cooperation with officials of the Geological Survey engaged in land-classification work, was continued through August, 1918, when the party assigned to this work was called for by the Reclamation Service. This work with the Geological Survey was concerned primarily with the problems of soil classification in the Great Plains States, and a great deal of valuable information concerning the soils in the region was obtained. The data will be useful in preparing a soil map of the United States upon which the bureau and the Office of Farm Management are engaged. Studies of the same character, independent of the Geological Survey, were made in southeastern Utah and southwestern Colorado, late in the season after the forest-survey work in Utah had been finished.

At the request of the Reclamation Service, Interior Department, a party was assigned to the work of examining the soils of a number of areas in Wyoming, Utah, and Arizona, with regard to the feasibility of extending a number of existing irrigation projects. This work was carried on from the middle of August until midwinter.

The bureau also assisted the Bureau of Entomology of this department in the examination of the soils of several areas in the grape-growing sections of California, where the vineyards were suffering from phylloxera.

At the request of the American Geographical Society, in whose charge was placed the work of the House Commission for the Accumulation of Geographic and Economic Information concerning undeveloped or imperfectly developed parts of the world, information relating to the soils of Africa and Asiatic Russia was compiled. A generalized soil map of Africa, based on existing literature, was prepared and transmitted to the State Department.

At the request of the State Department, a party from the Soil Survey was sent in the spring of 1919 to Central America for the purpose of making an economic survey of parts of Guatemala and Honduras. The party finished its field work and returned to Washington in June. At the close of the year considerable progress had been made in the preparation of a report covering the work done. An area of about 12,000 square miles was examined.

The African compilation and the studies made in Central America not only supplied the information desired by the institutions requesting it, but also gave results of much value to the Soil Survey.
